U.S. COMMISSION ON IMMIGRATION REFORM

MANDATE

CONGRESSIONAL AUTHORIZATION

The bipartisan U.S. Commission on Immigration Reform was authorized by Section 141 of the Immigration Act of 1990. The Commission expired on December 31, 1997. The mandate of the Commission was to review and evaluate the implementation and impact of U.S. immigration policy and to transmit to the Congress reports of its findings and recommendations.

In particular, the Commission examined the implementation and impact of provisions of the Immigration Act of 1990 related to family reunification, employment-based immigration, and the program to ensure diversity for the sources of U.S. immigration. The Commission examined: the effectiveness of efforts to curb illegal immigration; the impact of immigration on labor needs, employment, and other economic and domestic conditions in the United States; the social, demographic, and natural resources impact of immigration; the impact of immigration on the foreign policy and national security interests of the United States; and various numerical limitations in the selection and adjustment of status of immigrants, asylees, and non-immigrants.

The Commission's first interim report *U.S. Immigration Policy: Restoring Credibility*, presented to Congress on September 30, 1994, focused primarily on controlling illegal immigration with unanimous recommendations for border management, work-site verification, program eligibility, and impact aid for states affected by illegal immigration.

The Commission's second interim report *Legal Immigration: Setting Priorities* was presented to Congress in 1995. Whereas the previous report focused on illegal immigration, this report presents near unanimous recommendations on family and employment-based immigration, refugee admissions, and naturalization/Americanization.

The Commission made two final reports to Congress in 1997: *U.S. Refugee Policy: Taking Leadership*; and *Becoming An American: Immigration and Immigrant Policy*.

U.S. COMMISSION ON IMMIGRATION REFORM

PEOPLE

COMMISSION MEMBERS

Shirley M. Hufstedler, Chair
Appointed by the President

Richard Estrada
Associate Editor, Dallas Morning News
Appointed by Senate Republican Leadership

Harold Ezell
President and Founder, Ezell Group
Appointed by House Republican Leadership

Lawrence H. Fuchs, Vice Chair
Jaffe Professor of American Civilization and Politics
Brandeis University
Appointed by Senate Democratic Leadership
Elected by Commisioners to be Vice Chair

Robert Charles Hill
Partner, Venable Baetjer Howard & Civilletti
Former Secretary of Department of Education
Named by President Clinton as Commission Chair

Shirley Mount Hufstedler
Former judge U.S. Court of Appeals, Ninth Circuit
Appointed by House Republican Leadership

Warren R. Leiden
Partner, Berry, Appleman & Leiden.
Appointed by House Democratic Leadership

Nelson Merced
Chief Executive Officer, Inquilinos Boricuas en Accion
Emergency Tenant Council, Inc.
Appointed by Senate Democratic Leadership

Bruce A. Morrison
Chairman, Federal Housing Finance Board
Appointed by House Democratic Leadership

Michael S. Teitelbaum, Vice Chair
Program Officer, Alfred P. Sloan Foundation
Appointed by Senate Republican Leadership
Elected by Commissioners to be Vice Chair

BINATIONAL STUDY: MIGRATION BETWEEN MEXICO AND THE UNITED STATES
ESTUDIO BINACIONAL: MIGRACION ENTRE MEXICO Y LOS ESTADOS UNIDOS
1997 (80 PAGES)
Executive Summary (PDF format, 98Kb)
Full Report to Congress (PDF format, 333Kb)

BACKGROUND

After a meeting of the Migration and Consular Affairs Group of the Mexican-United States Binational Commission in March 1995, the governments of Mexico and the United States decided to undertake a joint study of migration between the two countries. Research teams in each country studied each of five aspects of migration within their country and collaboratively analyzed the findings. National coordinators were designated for each country with the Commission on Immigration Reform coordinating the work of U.S. researchers. The main objective of the Binational Study is to contribute to a better understanding and appreciation of the nature, dimensions, and consequences of migration from Mexico to the United States. It also provides an opportunity to identify options to respond to these movements.

U.S. COMMISSION ON IMMIGRATION REFORM

ACTIVITIES

BINATIONAL RESEARCH PAPERS

The Mexico/United States Binational Study on Migration was a joint effort undertaken by twenty scholars from both countries who worked together in teams on five subject areas: quantification of migration; characteristics of migrants; factors that influence migration; effects of migration; and responses to migration. These researchers wrote background research papers and individual team reports, whose information and conclusions were collaboratively condensed and compiled into a joint summary report published under the title *The Binational Study on Migration Between Mexico and the United States*, available elsewhere on this web site. Available here is the three-volume publication, titled *Migration Between Mexico and the United States: Binational Study*. It consists of the individual team reports (Volume 1) and background research papers and materials (Volume 2 and Volume 3) that were prepared as part of the Binational Study and were the basis for the joint summary.

U.S. COMMISSION ON IMMIGRATION REFORM

Last updated on March 16, 1998

EXECUTIVE SUMMARY

INTRODUCTION

The U.S. Commission on Immigration Reform was created by Congress to assess U.S. immigration policy and make recommendations regarding its implementation and effects. Mandated in the Immigration Act of 1990 to submit an interim report in 1994 and a final report in 1997, the Commission has undertaken public hearings, fact-finding missions, and expert consultations to identify the major immigration-related issues facing the United States today.

This process has been a complex one. Distinguishing fact from fiction has been difficult, in some cases because of what has become a highly emotional debate on immigration. We have heard contradictory testimony, shaky statistics, and a great deal of honest confusion regarding the impacts of immigration. Nevertheless, we have tried throughout to engage in what we believe is a systematic, nonpartisan effort to reach conclusions drawn from analysis of the best data available.

Underlying Principles

Certain basic principles underlie the Commission's work. The Commission decries hostility and discrimination against immigrants as antithetical to the traditions and interests of the country. At the same time, we disagree with those who would label efforts to control immigration as being inherently anti-immigrant. Rather, it is both a right and a responsibility of a democratic society to manage immigration so that it serves the national interest.

It is both a right and a responsibility of a democratic society to manage immigration so that it serves the national interest.

Challenges Ahead

The credibility of immigration policy can be measured by a simple yardstick: people who should get in, do get in . . .

The Commission believes that legal immigration has strengthened and can continue to strengthen this country. While we will be reporting at a later date on the impacts of our legal immigration system, and while there may even be disagreements among us as to the total number of immigrants that can be absorbed into the United States or the categories that should be given priority for admission, the Commission members agree that immigration presents many opportunities for this nation. Immigrants can contribute to the building of the country. In most cases, they have been actively sought by family members or businesses in the U.S. The tradition of welcoming newcomers has become an important element of how we define ourselves as a nation.

The Commission is mindful of the problems that also emanate from immigration. In particular, we believe that unlawful immigration is unacceptable. Enforcement efforts have not been effective in deterring unlawful immigration. This failure to develop effective strategies to control unlawful immigration has blurred the public perception of the distinction between legal and illegal immigrants.

For the Commission, the principal issue at present is how to manage immigration so that it will continue to be in the national interest.

- How do we ensure that immigration is based on and supports broad national economic, social, and humanitarian interests, rather than the interests of those who would abuse our laws?

- How do we gain effective control over our borders while still encouraging international trade, investment, and tourism?

- How do we maintain a civic culture based on shared values while accommodating the large and diverse population admitted through immigration policy?

The credibility of immigration policy can be measured by a simple yardstick: people who should get in, do get in; people who should not get in are kept out; and people who are judged deportable are required to leave.

During the decade from 1980 to 1990, three major pieces of legislation were adopted to govern immigration policy—the Refugee Act of 1980, the Immigration Reform and Control Act of 1986, and the Immigration Act of 1990. The Commission supports the broad framework for immigration policy that these laws represent: a legal immigration system that strives to serve the national interest in helping families to reunify and employers to obtain skills not available in the U.S. labor force; a refugee system that reflects both our humanitarian beliefs and international refugee law; and an enforcement system that seeks to deter unlawful immigration through employer sanctions and tighter border control.

. . . people who should not get in are kept out . . . and people who are judged deportable are required to leave.

The Commission has concluded, however, that more needs to be done to guarantee that the stated goals of our immigration policy are met. The immediate need is more effective prevention and deterrence of unlawful immigration. This report to Congress outlines the Commission's recommendations in this area.

In the long term, immigration policies for the 1990s and beyond should anticipate the challenges of the next century. These challenges will be substantially influenced by factors such as the restructuring of our own economy, the establishment of such new trade relationships as the North American Free Trade Agreement [NAFTA], and changing geopolitical relations. No less importantly, immigration policy must carefully take into account social concerns,

demographic trends, and the impact of added population on the country's environment.

Finally, current immigration is the first to occur in what economists call a post-industrial economy, just as it is the first to occur after the appearance of the modern welfare state. The Commission's report to Congress in 1997 will cover these issues in assessing the impact of the Immigration Act of 1990. The present report reviews the progress of the beginning implementation of this legislation.

RECOMMENDATIONS

Serious problems undermine present immigration policies, their implementation, and their credibility: people who should get in find a cumbersome process that often impedes their entry; people who should not get in find it all too easy to enter; and people who are here without permission remain with impunity.

The Commission is convinced that unlawful immigration can be controlled consistent with our traditions, civil rights, and civil liberties. As a nation with a long history of immigration and commitment to the rule of law, this country must set limits on who can enter and then must credibly enforce our immigration law. Unfortunately, no quick and easy solutions are available. The United States can do a more effective job, but only with additional financial resources and the political will to take action. Our recommendations for a comprehensive, effective strategy follow.

Border Management

The Commission believes that significant progress has been made during the past several years in identifying and remedying some of the weaknesses in U.S. border management. Nevertheless, we believe that far more can and should be done to meet the twin goals of border management: preventing illegal entries while facilitating legal ones.

Far more can and should be done to meet the twin goals of border management: preventing illegal entries while facilitating legal ones.

Land Borders

Credibility is a problem at U.S. land borders, given the ease of illegal entry and various obstacles to legal entry. These problems are particularly prevalent at the U.S.-Mexico border, as the Commission's visit to San Diego and El Paso demonstrated. The Commission

believes that an underlying principle of border management is that prevention is far more effective and cost-efficient than the apprehension and removal of illegal aliens after entry. At the same time, the Commission believes that legal entry should be facilitated in order for the country to benefit from cross-border trade and tourism.

The Commission supports the strategy, now being tested as "Operation Hold the Line" in El Paso, that emphasizes prevention of illegal entry at the border, rather than apprehension following illegal entry. Prevention holds many advantages: it is more cost-effective than apprehension and removal; it eliminates the cycle of voluntary return and reentry that has characterized unlawful border crossings; and it reduces potentially violent confrontations on the border. The Commission recommends:

San Diego border patrol [INS photo]

- **Increased resources for prevention**, including additional staff, such improved technology as sensors and infrared scopes, data systems that permit expeditious identification of repeat offenders, and such additional equipment as vehicles and radios.

- **Increased training for border control officers** to execute strategies that emphasize prevention of illegal entry.

- **Formation of a mobile, rapid response team to improve Border Patrol anticipation of new smuggling sites and to augment their capacity at these locations.** The Immigration and Naturalization Service [INS] must develop a capacity to respond quickly to changing patterns of unlawful immigration along the land border. Also, contingency plans should be developed to

address increased boat arrivals that may arise from improved land border enforcement.

- **Use of fences to reduce border violence and facilitate enforcement. However, the Commission does not support the erection of extraordinary physical barriers, such as unscaleable walls, unless needed as a last resort to stop violence when other means have proved ineffective.** Fences have been used effectively in San Diego to reduce border violence, deter illegal aliens from running across the interstate highway that leads from Mexico, and facilitate enforcement.

- **Systematic evaluation of the effectiveness of any new border strategies by INS.** The typical measurements of Border Patrol effectiveness—apprehension rates—have little meaning in assessing a prevention strategy. INS should develop new evaluation techniques that measure the effects of border management efforts in terms of the flow of unauthorized aliens and their impacts on U.S. communities.

The Commission supports efforts to reduce potentially violent confrontations between Border Patrol officers and those believed to be seeking illegal entry into the U.S. Such confrontations were reduced, for example, during "Operation Hold the Line," in terms of both reported human rights violations against suspected illegal aliens and attacks on Border Patrol officers.

The Commission supports efforts already underway to address complaints about human rights violations, including:

- **Increased training and professionalism of Border Patrol officers to enable them to respond appropriately to potentially violent situations;**

- **Improved procedures for adjudicating complaints of Border Patrol abuses;**

- **Mechanisms to provide redress or relief to those subjected to improper actions;** and

- **More effective protection of Border Patrol officers from violence directed at them.**

The Commission believes that port of entry operations can be improved. Legal entry at the border should be facilitated as the United States benefits from trade, tourism, family visits and consumer spending. More specifically, the Commission supports:

Congestion at El Paso port of entry [INS photo]

- **Additional resources for inspections** at land border ports of entry.

- **An expedited adjudication and issuance process for the Border Crossing Card [BCC]**. Mexican nationals are required to have a visa (unlike Canadians). Because of the volume of BCC applications on the Mexican border, the Commission encourages negotiations between the U.S. and Mexico to amend the bilateral treaty to permit collection of fees to be used exclusively to expedite the issuance and adjudication of the card.

- **Further steps to better ensure that the BCC is not misused by legal crossers who engage in unauthorized employment after entry.** Each BCC should contain the legend indicating it is "not for work authorization," as currently appears on INS-issued cards.

- **Development of a land border user fee to pay for needed improvements in the inspection of border crossers,** with fees to be used exclusively to facilitate land border management.

The Commission supports increased coordination on border issues between the governments of the U.S. and Mexico. The Commission views favorably the discussions underway between the U.S. and Mexican governments. These discussions promote greater cooperation between the two governments in solving problems of mutual concern. In particular, the Commission encourages:

- **Continued cooperation in antismuggling efforts** to reduce smuggling of people and goods across the U.S.-Mexico border.

- **Bilateral discussions that take into account both U.S. entry and Mexican exit laws in devising a cooperative approach to regulating the movements of people across the U.S.-Mexican land border.** Mexican law requires that Mexican nationals exit Mexico through official inspection stations. Thus, unauthorized migration into the United States generally violates not only U.S. law, but Mexican law as well.

- **Cross border discussions and cooperative law enforcement efforts** among federal, state, and local officials of both countries to develop cooperative approaches to combat violent crimes and auto and cargo theft along the border.

- **Continued U.S. cooperation and support for Mexican efforts to address the problem of third-country nationals crossing Mexico** to come to the United States.

Airports

Each year about 50 million citizens and aliens enter the country through airports.

The Commission supports a combined facilitation and enforcement strategy that would prevent the entry of unauthorized aliens while facilitating legal admissions at U.S. airports as efficiently as possible, including:

- **The use of new technologies to expedite the inspections process and improve law enforcement, including more efficient processing of travelers with Machine Readable Documents.**

Immigration Inspection, O'Hare International Airport [INS Chicago District photo]

- **Programs that enhance the capacity of airline carriers to identify and refuse travel to aliens seeking to enter the U.S. on fraudulent documents,** including the Carrier Consultant Program and other coordinated efforts to maintain complete, accurate, and reliable Advance Passenger Information System [APIS] data and improved lookout data systems.

- **Continued government-airline industry discussions on improving inspections** that have led to innovative proposals.

- **Development of a system for mitigation of penalties or fines for those carriers that cooperate in screening and other programs and demonstrate success in reducing the number of unauthorized aliens they carry.**

- **Making INS, not the carrier, responsible for the actual physical custody of inadmissible air passengers.**

Interagency Coordination

The Commission expresses its dissatisfaction with the past lack of coordination between the Customs Service and the INS at ports of entry. This has hampered effective border management by both agencies.

The Commission recommends implementation of initiatives to improve coordination between INS and Customs, as recommended by the General Accounting Office [GAO] and the National Performance Review. The Commission will monitor these efforts to improve coordination of border management, particularly as they relate to immigration matters.

If these efforts prove ineffective, the Commission will recommend more extensive action, such as creating a new immigration and customs agency or designating one agency as the lead agency on inspections.

Alien Smuggling

Organized smuggling operations undermine the credibility of U.S. enforcement efforts and pose dangers to the smuggled aliens.

Aliens on the ship
Chin Lung Hsiang
[INS photo]

The Commission recommends an effective prevention strategy that requires enhanced capacities to combat organized smuggling for commercial gain. Possible enhancements include:

- **Expanded enforcement authorities,** such as Racketeer Influenced and Corrupt Organizations Act [RICO] provisions, wire-

tap authority, and expanded asset forfeiture for smuggling aliens; and

- **Enhanced intelligence gathering and diplomatic efforts** to deter smuggling.

Worksite Enforcement

Reducing the employment magnet is the linchpin of a comprehensive strategy to reduce illegal immigration.

The Commission believes that reducing the employment magnet is the linchpin of a comprehensive strategy to reduce illegal immigration. The ineffectiveness of employer sanctions, prevalence of fraudulent documents, and continued high numbers of unauthorized workers, combined with confusion for employers and reported discrimination against employees, have challenged the credibility of current worksite enforcement efforts.

Verification

A better system for verifying work authorization is central to the effective enforcement of employer sanctions.

The Commission recommends development and implementation of a simpler, more fraud-resistant system for verifying work authorization. The current system is doubly flawed: it is too susceptible to fraud, particularly through the counterfeiting of documents; and it can lead to increased discrimination against foreign-looking or foreign-sounding authorized workers.

In examining the options for improving verification, ***the Commission believes that the most promising option for secure, nondiscriminatory verification is a computerized registry*** using data provided by the Social Security Administration [SSA] and the INS.

The key to this process is the social security number. For decades, all workers have been required to provide employers with their social security number. The computer registry would add only one step to this existing requirement: an employer check that the social security number is valid and has been issued to someone authorized to work in the United States.

The Commission believes the computerized system is the most promising option because it holds great potential for accomplishing the following:

- **Reduction in the potential for fraud.** Using a computerized registry, rather than only an identification card, guards against counterfeiting of documents. It provides more reliable information about work authorization.

- **Reduction in the potential for discrimination** based on national origin and citizenship status, as well as inappropriate demands for specific or additional documents, given that employers will not be required to ascertain whether a worker is a citizen or an immigrant and will have no reason to reject documents they believe to be counterfeit. The only relevant question will be: "What is your social security number?"

- **Reduction in the time, resources, and paperwork** spent by employers in complying with the Immigration Reform and Control Act of 1986 [IRCA] and corresponding redirection of enforcement activities from paperwork violations to knowing hire of unauthorized workers.

The Commission recommends that the President immediately initiate and evaluate pilot programs using the proposed computerized verification system in the five states with the highest levels of illegal immigration as well as several less affected states. The Presi-

A computer registry to verify that a social security number is valid and has been issued to someone authorized to work in the U.S. is the most promising option for eliminating fraud and reducing discrimination, while protecting individual privacy.

dent has the authority to do so under Section 274A(d)(4) of the Immigration and Nationality Act. A pilot program will: permit the testing of various approaches to using the proposed verification system; provide needed information about the advantages, disadvantages, and costs of the various approaches; develop and evaluate measures to protect civil rights and civil liberties; and ensure that any potential obstacles, such as the quality of the data used in the registry, are addressed prior to national implementation. Assuming the successful results of the pilot program, Congress should pass the necessary statutory authorities to support more effective verification. Pilot program features should include:

- **A means by which employers will access the verification system to validate the accuracy of information given by workers**. We have received conflicting testimony about the best way to check the applicant's identity. We have heard proposals for a more secure social security card, a counterfeit-resistant driver's license, and a telephone verification system that does not rely on any document. The pilot program presents an opportunity to determine the most cost-effective, fraud-resistant, and nondiscriminatory method available.

- **Measures to ensure the accuracy of and access to the specific data needed** to ensure that employers have timely and reliable information when seeking verification of work authorization. Improvements in the Social Security Administration and INS databases must be made to ensure that these data are available. Procedures must be developed to ensure timely and accurate entry, update, extraction, and correction of data. The Commission strongly urges INS and the Social Security Administration to cooperate in this endeavor, as the proposed registry would be built upon and—once implemented—would support the primary missions of those agencies.

- **Measures to ensure against discrimination and disparate treatment of foreign-looking or -sounding persons.** The Commission believes that the least discriminatory system would have the same requirements for citizens and aliens alike. To reduce the potential for discrimination and increase the security of the system, the Commission also believes that employers should not be required to ascertain immigration status in the process of verifying authorization for employment. Their only requirement should be to check the social security number presented by each employee against the registry and record an authorization number to prove that they have done so.

- **Measures to protect civil liberties.** It is essential that explicit protections be devised against use of the database—and any card or any other means used to gain access to it—for purposes other than those specified in law. The uses to be made of the verification system must be clearly specified. We believe the worksite verification system could be used, without damage to civil liberties, for verifying eligibility to receive public benefits [see p. 22]. However, it should be stipulated that no one should be required to carry a card, if one is used, or to present it for routine identification purposes. There also should be penalties for inappropriate use of the verification process.

- **Measures to protect the privacy of the information included in the database.** The Commission is aware of the proliferation of databases and the potential for the invasion of privacy by both government and private agencies. There need to be explicit provisions for protecting privacy; the resultant system should incorporate appropriate safeguards regarding authorized users' access to individual information. In establishing privacy safeguards, it is important to take into account that, while access to any one piece of information may not be intrusive,

in combination with other information such access may violate privacy.

- **Estimates of the start-up time and financial and other costs** of developing, implementing and maintaining a national system in such a manner that verification is reliable.

- **Specification of the rights, responsibilities, and impact on individual workers and employers,** for example: what individuals must do; how long it will take for newly authorized workers to get on the system and to correct inaccurate data; and what will be required of employers and at what expense. Provisions must also be developed to protect both workers from denial of employment and employers from penalties in cases where the information provided by the computer registry may be missing or inaccurate.

- **A plan for phasing in of the system.** The Commission recognizes that the proposed verification system will result in financial costs. The system should be phased in to lessen the immediate impact. The pilot programs should test various phase-in procedures. Given the required levels of accuracy, reliability, and convenience required, the evaluation should help measure the cost of phasing in the system nationally.

The Commission recommends evaluation of the pilot programs to assess the effectiveness of the verification system. The evaluation should include objective measures and procedures to determine whether current problems related to fraud, discrimination, and excessive paperwork requirements for employers are effectively overcome without imposing undue costs on the government, employers, or employees. The evaluation should pay particular attention to the effectiveness of the measures used to protect civil liberties and privacy.

The Commission supports INS efforts to improve its Telephone Verification System/SAVE [TVS/SAVE] database—but only as an interim measure. The improvements are essential for improving the data needed for the new, more effective verification process. The Commission is aware of the inadequacies of the current INS data that would be used in the proposed system. The Commission does not endorse the TVS/SAVE program as a long-term solution to the verification problem because use of TVS/SAVE requires the inadequate mechanism of self-attestation by workers as to their citizenship or alienage, thus making it easy for aliens to fraudulently claim U.S. citizenship. It also imposes requirements on legal immigrants that do not apply to citizens. Nevertheless, improvements in this database, as well as the Social Security Administration database, are essential to the development of a more secure, less potentially discriminatory verification system.

The Commission also recommends action that would reduce the fraudulent access to so-called "breeder documents," particularly birth certificates, that can be used to establish an identity in this country, including:

- **Regulation of requests for birth certificates** through standardized application forms;

- **A system of interstate and intrastate matching** of birth and death records;

- **Making certified copies of birth certificates issued by states or state-controlled vital records offices the only forms accepted by federal agencies**;

False documents [INS photo]

- **Using a standard design and paperstock for all certified copies** of birth certificates to reduce counterfeiting; and

- **Encouraging states to computerize** birth records repositories.

To address the abuse of fraudulent documents, the Commission recommends imposition of greater penalties on those producing or selling such documents. Document fraud and counterfeiting has become a lucrative and well-organized operation that may involve international networks that conspire to produce and sell the resulting fraudulent products. These documents are used in smuggling and terrorist operations, as well as for work authorization. RICO provisions designed to facilitate racketeering investigations should cover conspiracy to produce and sell fraudulent documents. Criminal penalties should also be increased for large-scale counterfeiting activities

Antidiscrimination Strategies

Mechanisms must effectively prevent and redress immigration-related discrimination.

The Commission is concerned about unfair immigration-related employment practices against both citizens and noncitizens that may occur under the current system of employer sanctions. A more reliable, simpler verification system holds great potential to reduce any such discrimination because employers will no longer have to make any determination as to immigration status. Nevertheless, mechanisms must effectively prevent and redress discrimination.

The Commission recommends that the Office of the Special Counsel [OSC] for Immigration-Related Unfair Employment Practices in the Department of Justice initiate more proactive strategies to identify and combat immigration-related discrimination at the workplace. OSC should target resources on independent investigations and on programs to assess the incidence and prevalence of unfair immigration-related employment practices.

The Commission also recommends a methodologically-sound study to document the nature and extent of unfair immigration-related employment practices that have occurred since GAO's 1990 report. The new study should measure the effects of immigration policy—as distinct from other factors—on discrimination at the worksite. As noted above, the pilot programs should be evaluated to determine if they substantially reduce immigration-related discrimination at the workplace.

Employer Sanctions and Labor Standards Enforcement

Enforcement of employer sanctions, wage/hour, child labor, and other labor standards can be an effective tool in reducing employment of unauthorized workers.

The Commission believes that enforcement of employer sanctions, wage/hour, child labor, and other labor standards can be an effective tool in reducing employment of unauthorized workers. The Commission finds, however, that current enforcement efforts are inadequate. In addition, the Commission expresses its concern that current coordination efforts between the Immigration and Naturalization Service and the Department of Labor are insufficient.

The Commission supports vigorous enforcement of labor standards and enforcement against knowing hire of unauthorized workers as an integral part of the strategy to reduce illegal immigration. Labor standards and employer sanctions should be seen as mutually reinforcing. Specifically, the Commission recommends:

- **Allocation of increased staff and resources to the enforcement of labor standards to complement employer sanctions enforcement.**

- **Vigorous enforcement, increased staff and resources, and full use of current penalties against those who knowingly hire unauthorized workers.** If the new verification system proposed by the Commission substantially reduces inadvertent hiring of unauthorized workers—as we believe will occur—Congress

should discontinue paperwork penalties and evaluate the need for increased penalties against violators and businesses that knowingly hire or fail to verify work authorization for all employees.

- **Targeting of investigations to industries that have a history of using illegal alien labor.**

Garment industry violations [Department of Labor photo]

- **Enhanced enforcement efforts targeted at farm labor and other contractors** who hire unauthorized workers on behalf of agricultural growers and other businesses.

- **Application of employer sanctions to the federal government**. At a minimum, the President should issue an Executive Order requiring federal agencies to abide by the procedures required of other employers. Alternatively, legislation should stipulate that federal agencies follow the verification procedures required of other employers and be subject to penalties if they fail to verify work authorization.

The Commission urges the Attorney General and the Secretary of Labor to review the current division of responsibilities between the Departments of Justice and Labor in the enforcement of employer sanctions and labor standards. INS and the Department of Labor have signed a Memorandum of Understanding [MOU] that spells out each agency's responsibility for enforcing employer sanctions and labor standards. Preliminary evidence indicates that few warnings have been issued to employers under the MOU. The implementation of the MOU should be closely monitored over the next twelve months. Should the monitoring demonstrate that the joint

efforts have not resulted in effective enforcement, it may be necessary to designate a single agency to enforce employer sanctions.

The Commission recommends enhanced coordination mechanisms to promote cooperation among all of the agencies responsible for worksite enforcement. Strategies to promote coordination at headquarters and in field operations include:

- **Establishment of a taskforce in Washington, D.C., to review and set policy**;
- **Local taskforces of worksite investigators** to coordinate field operations; and
- **Continued joint training for worksite investigators** from all applicable agencies.

Education

Thousands of new businesses begin operations each year. New workers enter the labor force each year as well.

The Commission recommends coordination and continuance of educational efforts by the Immigration and Naturalization Service, the Office of Special Counsel, and the Department of Labor regarding employer sanctions, antidiscrimination provisions, and labor standards. The Commission calls upon these agencies to develop and communicate a single message to all employers and employees. The Commission also recommends the development of new strategies, including the enhanced use of technology, to inform employers and workers of their rights and responsibilities under the law.

Benefits Eligibility and Fiscal Impact

The eligibility of aliens for public benefits should be consistent with the objectives of our immigration policy.

The Commission believes a clear and consistent policy on immigrant eligibility for public benefits is needed. The Commission also believes that the federal government has a responsibility to mitigate the impacts of unlawful immigration on states and localities, particularly through renewed efforts to reduce illegal entries.

Eligibility

The U.S. has the sovereign authority to make distinctions as to certain rights and responsibilities of various people subject to its jurisdiction—illegal aliens, legal immigrants, and U.S. citizens. Policies regarding the eligibility of aliens for public benefits should be consistent with the objectives of our immigration policy.

The Commission recommends that illegal aliens should not be eligible for any publicly-funded services or assistance except those made available on an emergency basis or for similar compelling reasons to protect public health and safety (e.g., immunizations and school lunch and other child nutrition programs) or to conform to constitutional requirements. Illegal aliens are now eligible for few benefit programs. The Commission firmly believes that benefits policies should continue to send this message: if aliens enter the U.S. unlawfully, they will not receive aid except in limited instances. Federal legislation should permit states and localities to limit eligibility of illegal aliens on this same basis. Should illegal aliens require other forms of assistance, their only recourse should be return to their countries of origin.

- **The pilot programs on work authorization also should test new procedures for verification of benefit eligibility.** Verification of eligibility for federally-funded benefits is an essential

part of the overall strategy for maintaining a credible benefits enforcement policy. Many of the shortcomings of the eligibility verification process are parallel to those for employment. The proposed pilot programs will provide an opportunity to test new approaches to benefit eligibility verification.

- **An equitable policy based on immigration status must be adhered to in cases of mixed households** (households in which some members are legal residents and/or citizens and others are illegal aliens). Regardless of a family's economic situation, only citizen members or those legally authorized to reside and work in the U.S. should receive routine benefits. Some benefits could be prorated in order to provide them only to eligible recipients in a household.

The Commission recommends against any broad, categorical denial of public benefits to legal immigrants. The United States admits legal immigrants with the expectation that they will reside permanently in the United States as productive residents. Therefore, the Commission believes that:

- **The safety net provided by needs-tested programs should continue to be available to those whom we have affirmatively accepted as legal immigrants into our communities.** U.S. immigration law bars the entry of those who are likely to become a public charge [see below]. However, circumstances may arise after entry that create a pressing need for public help—unexpected illness, injuries from a serious accident, loss of employment, a death in the family. Under such circumstances, legal immigrants should be eligible for public benefits if they meet other eligibility requirements.

Migrant healthcare [photo copyright 1992 Alan Pogue]

- **Sponsors should be held financially responsible for the immigrants that they bring to this country.** In particular, the Commission believes that the affidavits of support signed by sponsors should be legally enforceable, with contingencies made if the sponsor's financial circumstances change significantly for reasons that occurred after the immigrant's entry. Mechanisms should be developed that would ensure that sponsors actually provide the support they have promised. This would protect recent immigrants and close a loophole in current policy wherein the sponsor's income is "deemed," or taken into account, in calculating the immigrant's eligibility, regardless of whether such support is actually available to the immigrant.

- **A serious effort to enhance and enforce the public charge provisions** in immigration law is needed to ensure that legal immigrants do not require public assistance within five years of entry for reasons that existed prior to entry. The Commission recommends modification in the procedures for deporting such individuals. The sustained use of public benefits for reasons that existed prior to entry should become the basis for deportation. Current practices are unreasonable: the government is required to show that the benefit program requested repayment of the aid under a specific statute and that the immigrant has refused repayment.

The Commission recommends that comprehensive categories of aliens in the U.S. be defined in the Immigration and Nationality Act to simplify determination of eligibility for public benefits. The Commission believes that benefit eligibility determinations are complicated by the myriad legal statuses now afforded to individuals within this country. While the rights of lawful permanent residents, refugees and asylees have been spelled out in the Immigration and Nationality Act and/or benefit laws, it is also true that the Congress,

Executive Branch, and the courts have created various other statuses that may or may not denote benefit eligibility. The Commission recommends:

- **Establishment of statutory categories of aliens according to their eligibility for work and benefits.** Such categories could include those who are authorized to work and eligible for needs-tested benefits, subject to public charge and sponsorship provisions; authorized to work and eligible only for benefits that accrue from employment; not authorized to work and not eligible for any but a circumscribed list of benefits.

- **Placement of every alien who is permitted to remain in the country on a temporary or permanent basis (whether by legislation, court order, or administrative order) in one of the designated categories.** The categories should reflect whether an alien has been affirmatively admitted to the United States, is awaiting a final decision on deportability, or has already been determined deportable and is awaiting removal.

Impact on States and Localities

Difficulties in enforcing U.S. immigration laws have created fiscal impacts that would not have occurred had enforcement strategies been more effective. The ineffective enforcement has been due, in some measure, to a lack of political will on the part of decision-makers, including officials and representatives of states now heavily affected by illegal immigration. Nevertheless, the federal government clearly bears a responsibility for alleviating these impacts, particularly through renewed efforts to reduce unlawful immigration.

The federal government clearly bears a responsibility for alleviating the impacts of unlawful immigration.

The Commission supports in principle a short-term authorization of impact aid to offset at least a portion of the fiscal burdens of

unlawful immigration until such time as better enforcement measures are in place. Any such aid should be provided contingent on the following conditions:

- **Better data and methods to measure the net fiscal impact of illegal immigration**. The Commission finds that weak data make it difficult to determine the extent of these burdens. The authorization of impact aid should follow a concerted effort to develop better data on such impacts, with impact assistance provided only to the extent that actual net costs are accurately identified.

- **Provision of any impact aid authorized in a manner commensurate with the interim period of regaining control over unauthorized immigration.** Impact aid mechanisms should be temporary and designed to ensure that governments do not become dependent on impact aid as a continuing source of funding.

- **Appropriate cooperation of state and local governments receiving impact aid with federal authorities** to enforce the immigration laws of the United States. The type of cooperation will vary depending on the assistance programs covered by impact aid and should be consistent with the federal laws and regulations that apply to the program in question. For example, law enforcement officers may be asked to provide information to identify convicted or arrested illegal aliens, whereas school officials would not be required to transfer information obtained from their pupils.

The Commission supports an immediate authorization of impact aid aimed specifically at criminal justice costs. The Commission believes impact assistance for criminal justice and law enforcement is justified where there is a high incidence of illegal aliens in the

criminal justice system. Specific costs attributable to the incarceration of illegal aliens can be reliably ascertained if state correctional departments cooperate with INS in identifying deportable illegal aliens in prisons. The federal government should assume responsibility for the costs of incarcerating illegal aliens through reimbursement, by incarcerating them in federal facilities, and/or by negotiating with foreign governments to accept and incarcerate their nationals who are criminal illegal aliens.

The Commission recommends further investigation of the costs of education and emergency medical assistance. The data currently available do not provide reliable estimates of the number of illegal alien children and the proportion of emergency medical assistance specifically associated with illegal aliens. While the Commission accepts in principle the need for enhanced federal funding to assist localities with the costs of providing elementary and secondary education to illegal alien children and of emergency medical care under Medicaid to illegal aliens, the Commission does not recommend that such a program be instituted until there is a workable method for accurately establishing actual costs.

Detention and Removal of Criminal Aliens

Prompt removal of aliens ordered deported is an essential part of a credible deterrence policy.

An effective procedure for prompt removal of aliens ordered deported is an essential part of a credible deterrence policy. If unlawful aliens believe that they can remain indefinitely once they are within our national borders, there will be increased incentives to try to enter or remain illegally. The Commission is reviewing the full range of issues raised by U.S. exclusion and deportation procedures and plans to issue a separate report on this subject in FY 1995. For the present, the Commission limits its specific recommendations to

the removal of criminal aliens who represent the most serious threat to public safety and national security.

The top priority of enforcement strategies should be the removal of criminal aliens from the U.S. in such a way that the potential for their return to the U.S. will be minimized. To help ensure the prompt and effective removal of criminal aliens, the Commission recommends:

- **Increased resources for INS investigations** to identify and initiate deportation of criminal aliens.

- **Enhanced use of the Institutional Hearing Program [IHP] as an effective mechanism to ensure that criminal aliens are identified and receive final orders of deportation while still serving their sentences.** The IHP is cost-effective in that criminal aliens can be deported directly from state and federal prisons, alleviating INS' need to detain them during deportation proceedings. The Commission commends the negotiations taking place between INS, the Executive Office of Immigration Review [EOIR], and state correctional departments to enhance their efficiency.

- **In the case of Mexico, repatriation of deported criminal aliens to the area of Mexico from which they came, rather than simply to the border.** Removals should be done in coordination with Mexican authorities who may then determine if there is a warrant for the arrest of the criminal alien for crimes committed in Mexico.

- **Use of bilateral treaties encouraging the transfer of criminal aliens to serve sentences in their own countries.** The Department of State should monitor these cases to be certain that sentences are served.

Immigration Emergencies

Since 1980, emergency circumstances in their home countries have prompted the migration of large numbers of people to the U.S. Their arrival, in turn, has created emergency circumstances within the United States. The exodus of Haitians and Cubans are only the most recent examples. An emergency can overwhelm resources and create massive problems that far outlast the emergency.

The Commission believes that a credible immigration policy requires the ability to respond effectively and humanely to immigration emergencies. Specific recommendations regarding emergencies will be the subject of a separate report in FY 1995 that will include discussion of contingency planning, interdiction, safe havens, refugee processing, asylum procedures, temporary protected status, aid to communities experiencing emergency arrivals of aliens, and other issues.

Haitian migrant interdiction
[Official U.S. Coast Guard photo]

An emergency can overwhelm resources and create massive problems that far outlast the emergency.

Curtailing Unlawful Immigration at the Source

Migrants enter and remain unlawfully in the United States for a variety of reasons. Few migrants take the decision to leave their countries lightly. Generally, a combination of "push" and "pull" factors contribute to these movements. Many of the recommendations in this report aim to reduce the pull of both jobs and of ineffective immigration enforcement. On the push side, lack of employment, low wages and poor working conditions, separation from family members, political, social and religious repression, civil conflict, and other problems motivate people to leave their homes. Any effective strategy to prevent unlawful migration must address these causes.

Any effective strategy to prevent unlawful migration must address both "push" and "pull" factors.

The Commission recommends that the United States give priority in its foreign policy and international economic policy to long-term reduction in the causes of unauthorized migration to the U.S. More specifically, the Commission supports:

- **The recommendations of the Commission for the Study of International Migration and Cooperative Economic Development related to trade with, and investment in, immigrant-sending countries.**

- **Adoption of quick and effective strategies targeted at alleviating migration pressures in communities producing large numbers of illegal aliens.**

- **Strengthening intelligence gathering capacities to improve early warning of unauthorized migration patterns.**

- **Coordinated efforts by the United States and other countries to address pressures for unlawful migration.** The Commission

recommends a strengthening of those multilateral coordination efforts that prove effective in averting unauthorized migration, particularly within the Western Hemisphere.

Improving Data

Throughout the Commission's own inquiry, we have found it difficult to assess the effects of immigration policy and of immigration itself because of inadequacies in the data. The Commission commends the work of the InterAgency Working Group on Immigration Statistics that is seeking to reform data collection efforts within the federal government. Reliable data is a necessary ingredient for credible policy and its implementation.

The Commission supports improved data collection efforts in four major areas:

- **Matching administrative data** on immigrants collected by the INS, Social Security Administration, and other agencies to obtain a more accurate profile of their experiences in this country;
- **Developing a methodology for better measuring the size of the illegal alien population and the flow of illegal aliens entering the United States;**
- **Developing new methods for estimating emigration** from the United States; and
- **Improving the estimates of the costs and benefits** associated with people of different immigration status.

File room [INS Chicago District photo]

Reliable data is a necessary ingredient for credible policy and its implementation.

THE IMMIGRATION ACT OF 1990 AND LEGAL IMMIGRATION

The Immigration Act of 1990 [IMMACT], which provided for the most comprehensive change in the legal immigration system since 1965, aimed to:

- Establish overall limits on legal immigration through adoption of a flexible cap on total numbers;
- Permit continued reunification of close family members (allowing increases above the cap if higher numbers of immediate relatives of U.S. citizens seek entry);
- Meet labor market needs by increasing the number of immigrants admitted for employment-based reasons and giving higher priority to the entry of professionals and others who are highly skilled; and
- Provide greater diversity through new opportunities for migration from countries with relatively small numbers of immigrants to the United States.

Naturalization ceremony
[INS photo]

IMMACT Effects on Migration

The principal provisions of IMMACT were not implemented until 1992, and with only two years worth of data, there is little experience to use in determining its effects. The Diversity

Table 1.
Immigrants Admitted by Major Category

Category of Admission	Average 1987-1991	1992	1993	Projected 1994
Subject to the Numerical Cap	**511,427**	**655,541**	**719,701**	**683,350**
Family-based immigrants	**439,614**	**502,995**	**539,209**	**512,600**
Immediate relatives of U.S. citizens and children born abroad to alien residents	227,551	237,600	257,089	252,900
Family-sponsored immigrants	212,062	213,123	226,776	225,300
Legalization dependents	NA	52,272	55,344	34,400
Employment-based immigrants	**58,341**	**116,198**	**147,012**	**128,750**
Diversity programs	**13,473**	**36,348**	**33,480**	**42,000**
Not Subject to the Numerical Cap	**131,926**	**155,094**	**160,313**	**150,100**
Refugees and Asylees	98,858	117,037	127,343	131,000
Other	33,068	38,057	32,970	19,100
Total	**643,353**	**810,635**	**880,014**	**833,450**

Excludes persons granted legal permanent resident status under the provisions of the Immigration Reform and Control Act of 1986. Categories are arranged according to the limitations specified in IMMACT.

Program will not go into effect until FY 1995. The following analysis, therefore, must be considered preliminary at best.

As Table 1 shows, overall levels of legal immigration increased from an average of 640,000 during the five years preceding IMMACT implementation to an average 840,000 for the past three years. The immigrants fall into two major categories: those whose numbers are subject to an annual statutory cap and those whose numerical limits can change each year.

Statutory Cap

IMMACT established a flexible worldwide level of 700,000 family-based, employment-based, and diversity immigration visas for FYs 1992-1994. This limit can be "pierced" if the number of immediate relatives of U.S. citizens, for whom there are no numerical limits, exceeds 239,000 (FYs 1992-1994) and 254,000 (FY 1995 and after).

- **Family-sponsored immigration** increased modestly since passage of IMMACT, largely because of an increase in the number of immediate relatives of U.S. citizens. Waiting lists that number more than one million persons continue in the categories under which spouses and minor children of permanent residents and siblings of U.S. citizens enter the United States. Much of the growth in the backlog for spouses and children is attributable to the large number of legalized aliens who are now seeking to reunify with their families.

- **Employment-based immigration** represents a sizeable increase over the 58,000 average employment-based immigration pre-IMMACT. Nevertheless, employment-related admissions under the new legislation have been well below the statutory ceiling of 140,000. Many of those who entered, particularly in 1992, were

in the backlog of individuals who had applied prior to IMMACT. In addition, Chinese nationals who adjusted status under the provisions of the Chinese Student Protection Act were counted in this category. The economic recession may have led employers to petition for fewer immigrant workers than allowable under the IMMACT ceilings.

- **Diversity immigration** has not yet begun in its permanent form. The diversity transition program averaged 34,000 in FY 1992-93. As of FY 1995, 55,000 visa numbers will be available for the permanent diversity program.

Immigrants outside the Statutory Cap

The number of immigrants considered in the categories outside the statutory cap varies each year, largely depending on the number of refugees admitted in prior years who adjust to permanent resident status. Refugees are initially admitted under conditional status and may adjust to permanent resident status after one year. Because of the increase in refugee admissions from the former Soviet Union that began in 1988, the 1990s have seen an increase in refugee adjustments.

Characteristics of Legal Immigrants

INS maintains data on the countries of origin, age, gender, occupation, and place of intended residence of new immigrants.

- **Places of origin.** IMMACT has not changed the regional origins of immigrants significantly. Asia accounts for more than 40 percent of new admissions, while North America, including Mexico, accounts for another 30 percent. Mexico appears to have almost doubled its number of new arrivals since IMMACT passed, largely because of the legalization dependents program and the

elimination of per-country limits for some second preference family visas.

- **Age and gender**. The median age of immigrants admitted in FYs 1992 and 1993 was 28. About 54 percent of the immigrants were female and 46 percent were male. By contrast, during the 1980s, men and women were equally represented. The trend toward more women admitted as legal immigrants began prior to IMMACT. It is likely to be reinforced by the entry of the family members of aliens legalized under IRCA. Very high proportions of young adult legalized aliens were men, many of whom have already petitioned for their wives.

- **Intended residence.** Immigration follows much the same pattern as in the 1980s regarding intended residence. Approximately 70 percent of the immigrants intend to live in the six states of California, New York, Texas, Florida, New Jersey, and Illinois. More than 25 percent of immigrants intend to live either in New York City or Los Angeles. Other metropolitan areas with significant immigrant arrivals are Chicago, Miami, Washington, D.C., and San Francisco.

- **Occupation**. Among those who reported an occupation, the percentage of immigrants of working age who were professionals or executives increased slightly from 15 percent in the two years before IMMACT to 17 percent in fiscal years 1992 and 1993. Every other occupation group declined, except for operators, fabricators, and laborers, which increased from 9.2 to 9.7 percent.

Looking to the Future

Much has changed in the U.S. and the world since passage of IMMACT—for example, the end of the Cold War, cutbacks in many defense industries, and such new trade arrangements as NAFTA and the most recent round of GATT. Commission recommendations must take into account this changing context, along with the changes brought about by IMMACT.

Future Commission activities will include:

- Exercising the Commission's mandate to assess the impact which the establishment of a national level of immigration has upon the availability and priority of family preference visas.

- Developing an understanding of both the long- and short-term interconnections between immigration and the U.S. economy and labor market with an eye toward formulating sound immigration policy.

- Examining the effects of our immigrant population on social and community relations, as well as the effects of American life on immigrants. A further area of interest is the civic integration of immigrants, including participation in local, state, and national political affairs, development of political constituencies, and other manifestations of civic involvement.

- Looking at data and analyses regarding population pursuant to IMMACT's instruction to determine and report on the effects of immigration on demographics and natural resources.

- Analyzing and reporting on the relationship between immigration and the environment as mandated by IMMACT.

- Examining the interconnections between U.S. immigration and international trade and foreign policy.

Plans for FY 1995—FY 1997

The Commission will launch a new research program to gauge the effects of IMMACT upon the size and characteristics of the incoming immigrant population and to evaluate the impacts that legal immigration poses for family reunification, the U.S. economy, social relations, demographics, the environment, foreign policy, and national security.

The Commission will also develop further recommendations to address two of the issues touched on in this report—removal of deportable aliens and handling of immigration emergencies.

The Commission plans to continue its schedule of public hearings, roundtable consultations and fact-finding missions. The Commission's assessments will be discussed and recommendations offered in future reports.

Future Commission activities will examine: immigration and family reunification, the U.S. economy, social and community relations, population, environment, and international trade and foreign policy.

THE NATIONAL INTEREST

A properly regulated system of legal immigration is in the national interest of the United States. Such a system enhances the benefits of immigration while protecting against potential harms.

A properly regulated system of legal immigration is in the national interest of the United States. Such a system enhances the benefits of immigration while protecting against potential harms.

Immigrants often create new businesses and other employment-generating activities that promote the renewal of city neighborhoods and commercial districts. Immigrants also can strengthen America's economic and political ties with other nations and, thus, enhance our ability to compete in a global economy and provide leadership in international and humanitarian affairs. Properly regulated immigration further strengthens American scientific, literary, artistic and other cultural resources. It promotes family values and ties, important components of good schools and strong communities. At a time of troubling ethnic strife in many parts of the world, an effective American immigration policy can demonstrate to other countries that religious and ethnic diversity are compatible with national civic unity in a democratic and free society.

Legal immigration, however, has costs, as well as benefits. Immigrants with relatively low education and skills may compete for jobs and public services with the most vulnerable of Americans, particularly those who are unemployed or underemployed. Jobs generated by immigrant businesses do not always address this problem. Concentrated and/or rapid entry of immigrants into a locality may impose immediate net costs, particularly in education funding to meet the additional and special needs of newcomers. Concentration of new immigrants can exacerbate tensions among ethnic groups. Certain legal immigrant populations may impose other costs: refugees often need special health and other services, making per capita resettlement more costly than overseas solutions; elderly new immigrants are more likely to draw upon public services than elderly

Immigrant Admissions by Major Category: FYs 1990-1994

Category of Admission	1990	1991	1992	1993	1994

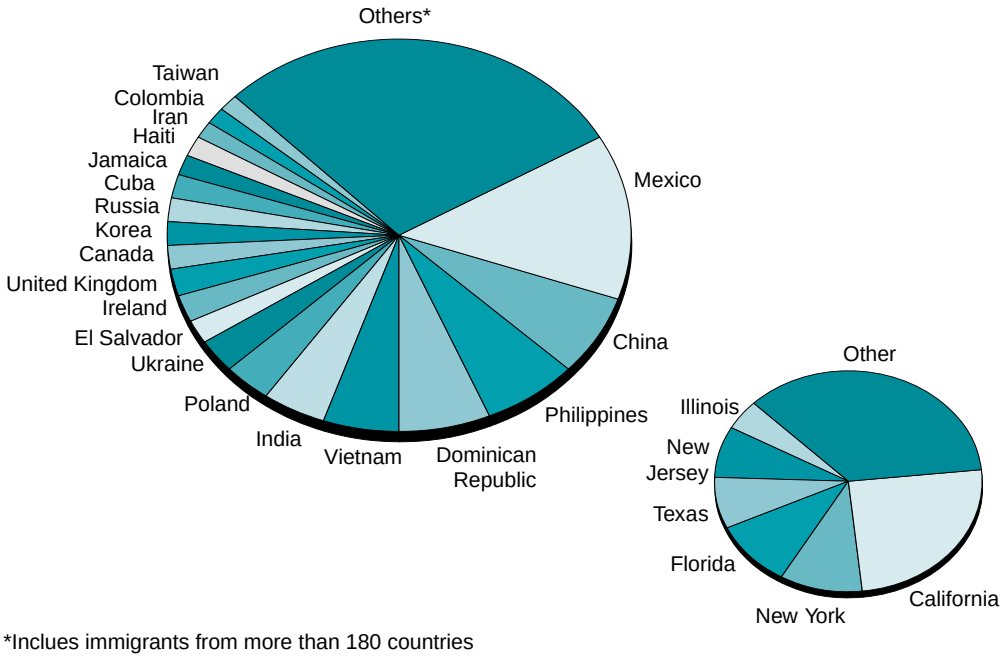
native-born Americans or immigrants who came to the United States at a younger age.

The recommendations in this report strongly affirm the value of a properly regulated immigration system. They seek to maximize the many positive opportunities that legal immigration presents to our nation. At the same time, the recommendations will help mitigate potential negative impacts, particularly on disadvantaged U.S. workers. Finally, the Commission's recommendations support effective Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy, and equal opportunity. These recommendations should help ensure that our legal immigration system will continue to serve the national interest of the United States.

Origin and Destination of Immigrants
FY 1994



*Inclues immigrants from more than 180 countries

FRAMEWORK FOR IMMIGRATION REFORM

The Commission supports the basic framework of current policy—family unification, employment-based immigration, and refugee admissions. We considered alternative frameworks, particularly a point system, but rejected these approaches. We believe that a system that relies on formulas and bureaucratic procedures for determining which immigrants meet the ability criteria for admission is not as effective in serving the national interest as one that relies on the judgment of American families and employers within a framework that protects U.S. workers from unfair competition. At the same time, the Commission is convinced that our current immigration system must undergo major reform to ensure that admissions continue to serve our national interests. Hence, ***the Commission recommends a significant redefinition of priorities and a reallocation of existing admission numbers to fulfill more effectively the objectives of our immigration policy.****

The Commission supports the basic framework of current policy—family unification, employment-based immigration, and refugee admissions—but is convinced that our current immigration system must undergo major reform to ensure that admissions continue to serve our national interests.

*See Appendix for Commissioner Leiden's dissenting statement.

PRINCIPLES FOR A PROPERLY REGULATED IMMIGRATION POLICY

The Commission believes that our immigration system should rest upon certain basic principles.

Clear Goals and Priorities. Sound immigration policy must set out clear goals and give priority to the admission of those immigrants who best meet those goals.

Enforcement of Immigration Limits. An effectively regulated immigration policy establishes limits on the number of immigrants that are consistent with the goals of the various categories under which immigrants enter. Moreover, these limits must be enforceable *and* enforced. We underscore our commitment to curtailing illegal immigration as embodied in our 1994 recommendations. We will continue to monitor progress toward their implementation until the expiration of our mandate in September 1997.

Regular Periodic Review. An effectively regulated system requires some flexibility with regard to numbers so as to permit adjustment as circumstances in the United States change.

Clarity and Efficiency. Immigration policy should not be overly complex, and the mechanisms used to implement immigration policy should be efficient and comprehensible. The terms used should be as clear and self-explanatory as possible. The number of visas allocated to various immigrant categories should be sufficient to ensure the expeditious entry of those of highest priority. Backlogs in high priority categories undermine the

purposes of immigration policy, while backlogs in lower priority categories give false hope to individuals whose admissions are of lesser national interest.

Enforcement of Sponsor Responsibility. A properly regulated immigration policy will hold sponsors accountable for keeping immigrants from becoming burdens on the American taxpayer and enforce that accountability through legally binding obligations.

Protection of U.S. Workers. A properly regulated system will also provide protection to American workers against unfair competition arising from immigrant categories that are designed to enhance U.S. economic strength. A higher level of job protection should be made available to the most vulnerable in our society.

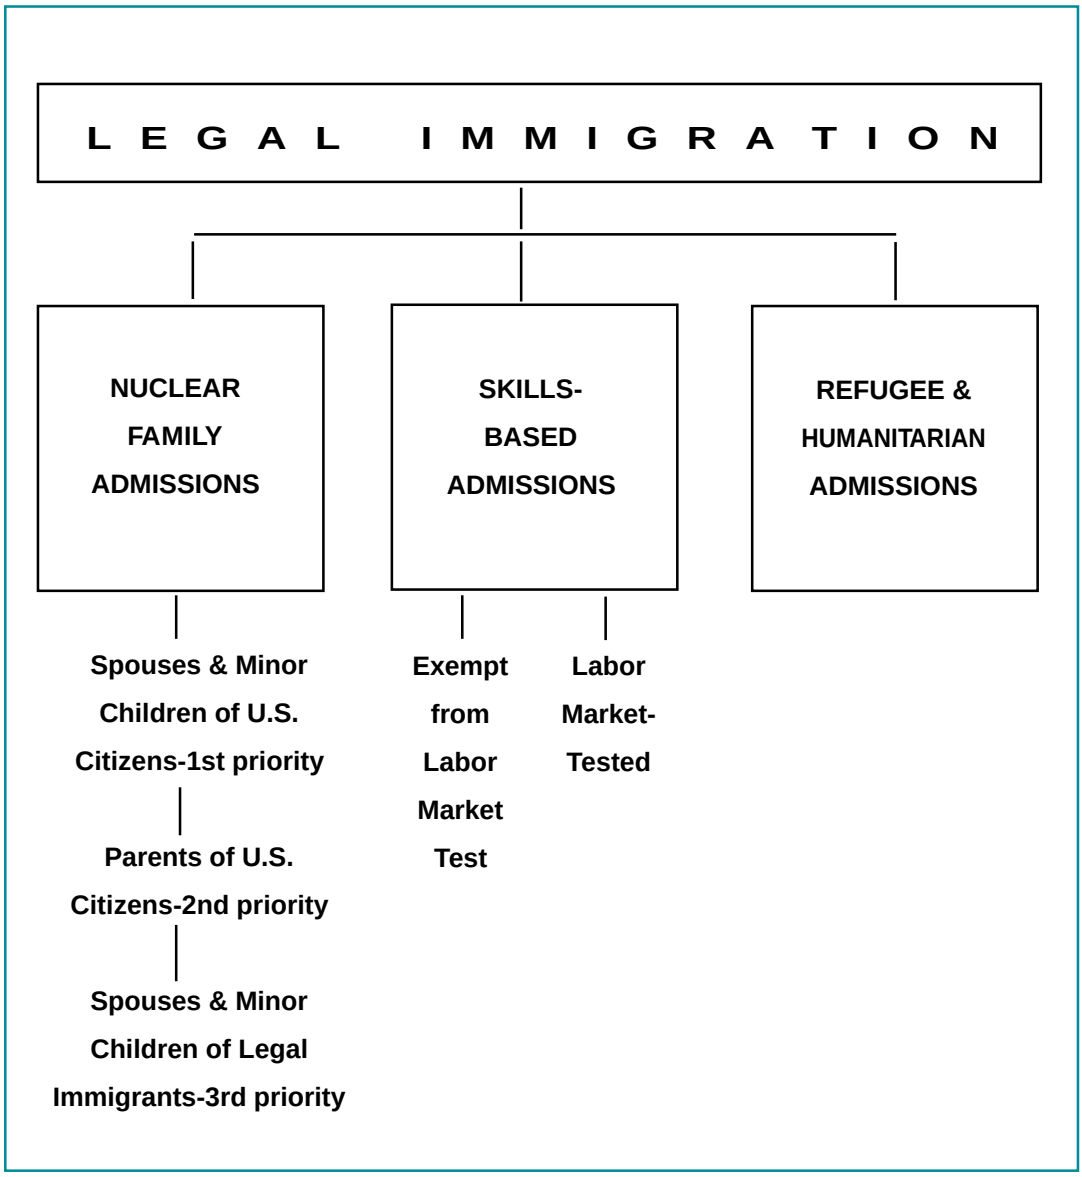
Coherence. Both temporary and permanent admissions categories must be seen as integral parts of a coherent legal immigration policy. Temporary student, worker, and humanitarian categories are linked to permanent immigration. Inefficiencies and inconsistencies in the procedures for determining admissibility in permanent categories frequently lead employees, employers, and even family members to use temporary categories to gain entrance when the immigrant's true intention is permanent residence.

Americanization. Immigration policy is not credible without attention to English language training, civic education, and preparation for naturalization and effective citizen participation. Americanization—by which we mean cultivation of a shared commitment to the American values of liberty, democracy, and equal opportunity—is desirable and possible regardless of the

nationality, native language, or religious background of immigrants and their children.

A Transition Period. Fundamental immigration reform, as proposed by the Commission, requires a period of transition to get from the present system to the new one. We recommend prudent, measured steps to make that transition possible.

Proposed Tripartite Immigration System



RECOMMENDATIONS

The following recommendations will contribute to a more accountable and credible application of our immigration policy:

The Commission supports a tripartite immigration policy that permits the entry of nuclear family members, professional and skilled workers, and refugees and other humanitarian admissions. In addition, the Commission urges Congress to take steps to address the continued aftereffects of the 1986 Immigration Reform and Control Act [IRCA] that provided legal status to formerly illegal aliens.

The Commission proposes a core immigration admissions level of 550,000 per year, to be divided as follows:

Nuclear family immigration	400,000;
Skill-based immigration	100,000;
Refugee resettlement	50,000.*

The Commission further recommends that Congress authorize 150,000 visas annually for the admission of the spouses and minor children of legal permanent residents who have been awaiting entry until such time as this backlog is eliminated.

The Commission recommends that admission levels be authorized by Congress for a specified time period (e.g., three to five years) in order to ensure regular periodic review and, if needed, change by Congress.

These recommendations represent fundamental reform of U.S. immigration policy.

These recommendations for entry of nuclear family members, professional and skilled workers, and refugees —with steps to address the aftereffects of IRCA— represent fundamental reform.

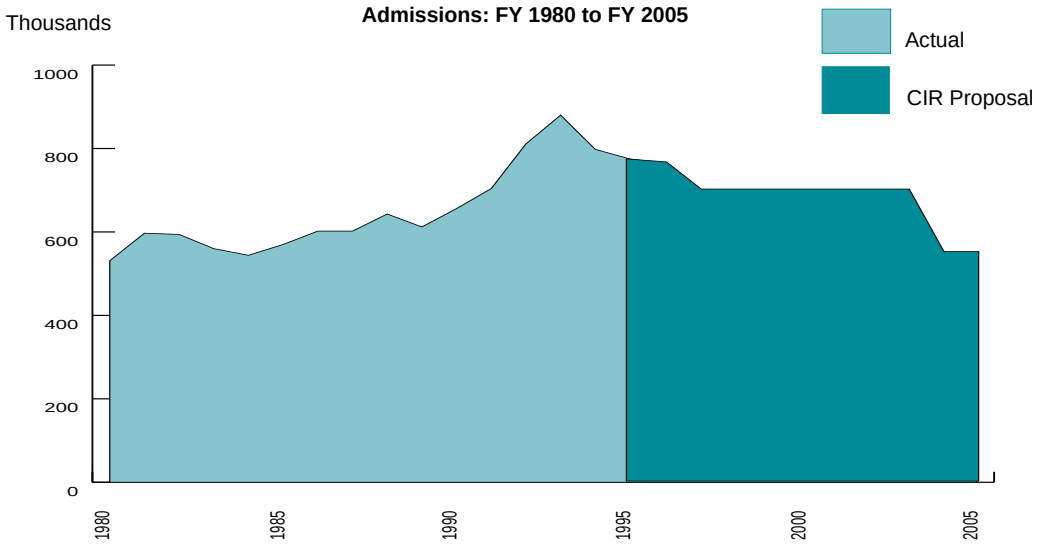
*Not including other humanitarian admissions, such as asylum adjustments.

Legal Immigration Levels

	Current		Proposed	
Category	Numerical Limits	FY 1996 Projected Use	Transition (5-8 years)	Core
Nuclear Family Admissions	480,000	480,000	550,000	400,000
Skills-based Admissions	140,000	100,000	100,000	100,000
Refugee Resettlement*	Variable	90,000	50,000**	50,000**
Diversity	55,000	55,000	0	0
TOTAL		**725,000**	**700,000**	**550,000**

*Does not include asylum claimants or other humanitarian admissions.
**50,00 is a target that can be exceeded in an emergency or with direct and affirmative participation by Congress.

Legal Immigration Admissions



Includes refugees who have adjusted to lawful permanent resident. Does not include IRCA legalization beneficiaries.

Nuclear Family Immigration

Immigration supports the national interest by promoting strong and intact nuclear families—that is, the basic social unit consisting of parents and their dependent children living in one household. Immigration contributes to this national interest by permitting the entry of *close* family members of U.S. citizens and permanent residents who otherwise may be separated for years. Immigration policy also can contribute to the strength of U.S. families by ensuring that immigrants receive any needed financial support from their own relatives and, thus, impose no financial burdens upon the taxpaying public.

Immigration policy can promote strong and intact nuclear families —while ensuring that family unification poses no public financial burdens.

The Commission recommends:

A prioritization of family relationships to determine who will be admitted through family-based immigration, with admission numbers going to those who are of the highest priority. Only to the extent that visas are available after the demand in higher priorities is met should visas be made available to lower priority categories. Following this reasoning, the Commission makes further recommendations.

- **Spouses and minor children of U.S. citizens should continue to be admitted as the first priority.** Also to be admitted under this priority are the small number of adult children dependent on U.S. citizen parents because of a mental or physical disability. This policy permits the expeditious entry of the closest family members while reinforcing the notion that citizenship confers additional benefits on those who become fully participating members of our polity.

- **Parents of U.S. citizens should be admitted as the second priority.** This permits adult children to sponsor their

parents, most of whom are past working age. However, the Commission is mindful of the potential negative impacts that the entry of parents may pose for the U.S. taxpayer if these individuals utilize Supplemental Security Income, Medicaid, and similar programs. Therefore, ***the Commission believes that continued admission of parents should be contingent on a legally enforceable affidavit of support***. The affidavit should ensure that parents who are unable to work enough quarters to become eligible for Social Security or Medicare do not become a burden to taxpayers through use of SSI, Medicaid, or equivalent state and local services. Further, the Commission recommends that affidavit signers (petitioners and, if necessary, coguarantors) should provide:

The backlog in nuclear family admissions, which results primarily from IRCA, can be cleared without creating another waiting list.

Verifiable assurance that they indeed have the capacity to provide what may be a lifetime of financial support to the parent immigrants; and

Verifiable assurance of the purchase of what may be lifetime health coverage for the parent immigrants (obtained either privately or through buying into Medicare, which the government should make available at an actuarially fair price).

- **Third priority should be allocated to spouses, minor children, and adult physically or mentally dependent children of legal permanent residents [LPRs].**

The Commission further recommends sufficient additional numbers, on an interim basis, to eliminate the backlog in the category for admission of spouses and minor children of LPRs. We believe that this backlog, which results primarily from the Immigration Reform and Control Act, can be cleared without creating another waiting list.

By the end of this fiscal year, 824,000 spouses and minor children of aliens legalized under IRCA will be waiting for visas. The number of new applications has fallen to only a handful for this group. However, since the filing of applications by the legalization beneficiaries, a backlog of 279,000 (or about 80,000 per year) spouses and minor children of other LPRs has developed. Under our current system, it would take more than a decade to clear the backlog, even with substantial naturalization. In the meantime, when an LPR sponsors a spouse and/or minor child, that individual goes to the end of the waiting list of 1.1 million.

We believe that priority for clearance of the backlog should go first to the spouses and minor children of LPRs who entered lawfully under the regular immigration preferences. Only afterwards should expedited admission be offered to the spouses and minor children of LPRs who entered under one of the legalization provisions of the Immigration Reform and Control Act.

The Commission recommends this separate treatment of the family members of those who became permanent residents through regular immigration and those who legalized under IRCA because:

- The circumstances are different for the two sets of spouses and minor children. Many of the families of the immigrants who legalized under IRCA are in the United States and, under the Family Unity provisions of the Immigration Act of 1990, have a quasi-legal status that permits their continued presence and work authorization. Many of the families of the other legal immigrants are separated, with their spouses and/or minor child(ren) living outside the United States.

- The legalized have already received special treatment in obtaining amnesty. To further reward their earlier illegal

Family-Based Immigration: Categories and Admission Numbers

CURRENT LAW	
CATEGORIES	USAGE (FY 1994)
Unlimited Spouses/Minor Children of USCs	193,394
Unlimited Parents of USCs	56,370
First Preference Adult Unmarried Sons/ Daughters of USCs	13,181
Second Preference 2A-Spouses/Children of LPRs (88,673) 2B-Adult Unmarried Sons/ Daughters of LPRs (26,327)	115,000
Third Preference Adult Married Sons/ Daughters of USCs	22,191
Fourth Preference Brothers/Sisters of USCs	61,589
TOTAL	**461,725**

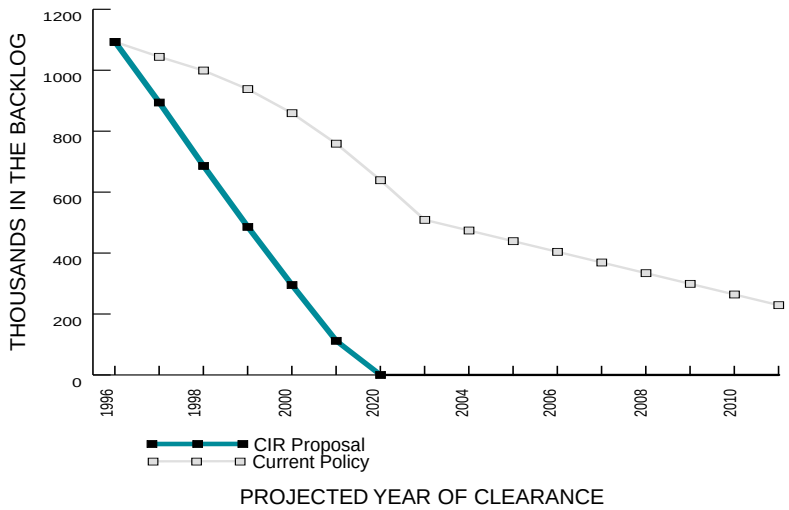
CIR RECOMMENDATIONS		
CATEGORIES	ADMISSIONS (Transition)	ADMISSIONS (Core)
First priority Spouses/Minor Children of USCs	up to 400,000 (current usage about 200,000)	400,000
Second priority Parents of USCs	400,000 less number admitted under first priority (current usage about 55,000)	400,000 less number admitted under first priority
Third priority Spouses/Minor Children of LPRs	400,000 less number admitted under first and second priorities plus 150,000 for backlog clearance	400,000 less number admitted under first and second priorities
TOTAL	**550,000**	**400,000**

entry by giving equal or higher priority to the entry of their relatives sends the wrong message at a time in which the U.S. must obtain greater control over unauthorized entry.

- As of December 31, 1995, most legalized aliens will be eligible to naturalize. As citizens, they will be able to expedite the admission of their spouses and minor children without using the additional visas earmarked for LPRs.

The Commission believes that the addition of 150,000 visas will permit the elimination of the regular LPR beneficiary backlog within three years and the legalization beneficiary backlog in five to eight years. Thereafter, the entry of all spouses and minor children of LPRs should be possible within a year of application under the proposed 400,000 admissions ceiling on family-based immigration.

Elimination of the Backlog: Spouses and Minor Children of Legal Immigrants



Includes projected admission upon naturalization of the petitioner.
Source: Department of State, Visa Office

The Commission recommends elimination of other family-based admission categories, including:

Adult, unmarried sons and daughters of U.S. citizens;

Adult, married sons and daughters of U.S. citizens;

Adult, unmarried sons and daughters of legal permanent residents; and

Siblings of U.S. citizens.

The Commission acknowledges that many individuals in these categories have contributed to U.S. society. Nevertheless, it is necessary at this time to emphasize the reunification of nuclear families. The elimination of these categories should take place one year after the date that legislation is enacted to accomplish this purpose. In this way, the plans of U.S. families that are on the verge of reunifying with their foreign siblings and adult children will not be unfairly disrupted.

The Commission recommends elimination of these categories for several reasons.

- The numbers now used to admit these individuals in more extended family relationships could be used instead to reduce the waiting time for closer family members without raising the overall levels of immigration.

- Elimination of these preferences will remove extraordinary backlogs that now undermine the credibility of our policy. Credible immigration policy should not give false hopes to applicants. An individual now applying under the sibling category, for example, could not expect to enter the U.S. legally for more than a decade. Applicants

from the Philippines face the longest waiting period—as much as forty years for those applying today.

- Unless there is a compelling national interest to do otherwise, immigrants should be chosen on the basis of the skills they contribute to the U.S. economy. The Commission believes that admission of nuclear family members and refugees provide such a compelling national interest. Reunification of adult children and siblings of adult citizens solely because of their family relationship is not as compelling.

The Commission recommends amendment of Section 201(c) of the Immigration and Nationality Act [INA] to provide that otherwise unused immigrant visa numbers for a fiscal year be made available to people who have a priority date that would entitle them to processing in that year but who were not issued visas.

Given the large backlog of spouses and minor children, all efforts should be made to ensure their expeditious entry by fully utilizing authorized visas. Under current policy visas unused because of administrative delay or personal reasons are lost. Allowing such unused visas to be made available to otherwise eligible immigrants after the end of that fiscal year ensures that all the visas allocated for family-sponsored immigrants would be used and charged to the given fiscal year. The new fiscal year visa numbers would not reflect an increase in visas allocated over the annual worldwide limit for family-based immigration.

For example, if 400,000 visas were allocated for family-sponsored immigrants in FY 1997, and during that year only 390,000 visas were issued because 10,000 immigrants were delayed beyond the end of the fiscal year, the remaining 10,000 visas could be issued to the delayed or other eligible aliens during the next fiscal year but would

count toward the original year. Under the proposed amendment, the Department of State could charge to FY 1997 all visas allocated in that year even though the visas themselves might not be issued in FY 1997. As the recommendation affects only aliens already entitled to a visa, annual number limitations would not be exceeded.

The Commission further recommends that the INA be amended to address better the aging-out problem of certain aliens. One unfortunate side effect of waiting lists is the aging-out of minor children who become adults while awaiting their already approved petition. This issue, which arises particularly in the case of the minor children of legal permanent residents, will become even more of a problem with the elimination of admission opportunities for adult children. For example, the minor child of a legalized alien may have been granted Family Unity status with the understanding that eventually a visa would be available. Under current law, a child who has aged-out would rarely be deported but is no longer eligible for permanent residence as a minor child. A provision stating that "a person entitled to status at the time a petition is approved shall continue to be entitled to that status regardless of his or her age" would allow such applicants to retain their eligibility for immigrant visas.

The benefits of immigration for U.S. global competitiveness must be balanced with policy that develops a U.S. workforce with the skills necessary to compete in the global economy.

Skill-Based Immigration

Immigration can support the national interest by bringing to the U.S. individuals whose skills would benefit our society. It also can help U.S. businesses compete in the global economy. This national interest in the competitiveness of business must be balanced by an equally compelling national interest in developing a U.S. workforce that has the skills necessary to compete in the global economy. Immigration policy can contribute to this national interest by:

- Focusing on the admission of highly-skilled individuals;
- Giving employers access to a global labor market when they cannot identify U.S. workers with knowledge and expertise required for a specific job or when they demonstrate a labor shortage that cannot be filled through short-term training programs;
- Helping companies conducting business, both in the United States and internationally, to reassign personnel as needed to maintain their competitiveness;
- Encouraging entrepreneurial activities and other investment in the United States aimed at creation of jobs;
- Providing a means of ensuring that U.S. workers are not displaced or otherwise adversely affected by the entry of foreign workers; and
- Providing incentives or penalties to help ensure that employers in the U.S. engage in serious recruitment of American workers (for example, national rather than local recruitment where appropriate) and contribute significantly to the training of the domestic U.S. workforce.

Offers of employment to foreign workers should be conditioned on an appropriate test of the domestic labor market to ensure that qualified American workers are not displaced or otherwise adversely affected.

The Commission recommends that the preferences for the admission of skill-based immigrants be reorganized to establish two categories: those subject to a labor market test, which we would expect to be the norm; and those who, for significant and specific policy reasons, should be exempt from such a labor market test. Labor market testing requires a demonstration that a business has a *bona fide* need for the skills of a foreign worker and cannot find a qualified U.S. worker or one who could be readily trained for the intended job.

Skills-Based Immigration: Categories and Admission Numbers

CURRENT LAW

Categories	Usage (FY 1994)
FIRST PREFERENCE Aliens with Extraordinary Ability Outstanding Professors/Researchers Multinational Executives and Managers	21,053
SECOND PREFERENCE Professionals with Advanced Degrees	14,432
THIRD PREFERENCE Skilled Workers (2 years training/experience) Professionals with Baccalaureate Degrees	46,269
FOURTH PREFERENCE Ministers and Religious Workers	7,946
FIFTH PREFERENCE Investors (Entrepreneurs)	444
TOTAL	**90,134**

CIR RECOMMENDATIONS

Categories	Admissions (proposed)
LABOR MARKET TEST EXEMPT Aliens with Extraordinary Ability Multinational Executives and Managers Entrepreneurs Ministers and Religious Workers (Limited to current usage, about 8,000)	Up to 100,000 (current usage about 30,000)
LABOR MARKET TESTED Professionals with Advanced Degrees (Including professors and researchers who do not meet the definition of "extraordinary") Professionals with Baccalaureate Degrees Skilled Workers (5 years specialized experience)	100,000 less number admitted in exempt category (current usage about 60,000)
TOTAL	**100,000**

Exempt workers should include those individuals whose entry will generate economic growth and/or significantly enhance U.S. intellectual and cultural strength without undermining the employment prospects and remuneration of U.S. workers. The following individuals should be exempt:

Individuals at the very top of their chosen field whose extraordinary ability in the sciences, arts, education, business, or athletics is demonstrated by sustained national or international acclaim and whose achievements have been recognized through extensive documentation, or individuals who have demonstrated the potential for extraordinary achievement in their chosen field through extensive documentation, including the receipt of internationally-recognized prizes and the testimony of appropriate experts;

Managers and executives of international businesses whose expertise contributes to U.S. global competitiveness. Greater safeguards must be put in place to ensure that only *bona fide* international businesses benefit from this policy;

Entrepreneurs whose active investment in new commercial enterprises generate a significant number of jobs for American workers in the United States;

A limited number of individuals ordained by a religious denomination and other religious workers who have carried on the religious vocation abroad during the two years immediately preceding the application for admission and who are members of a religious denomination having a *bona fide* nonprofit, religious organization in the United States that sponsors them.

Labor market-tested foreign workers permitted to immigrate to the United States under these categories should include only those

who have attained a baccalaureate or higher academic degree or those who are needed to fill jobs that require a high level of specific skills above the entry or journeyman level. Categories that would require a test of the domestic labor market include:

Professionals with advanced degrees, including professors and researchers who do not meet the definition of "extraordinary;"

Professionals with baccalaureate degrees, and skilled workers with a minimum of five years of specialized work experience, whose admission should be scrutinized strictly to ensure that they will have no adverse effect on similarly qualified U.S. workers.

We see little justification for admitting unskilled foreign workers into an economy that must find job opportunities for millions of unskilled U.S. workers.

The Commission recommends the elimination of the admission of unskilled workers. Unless there is another compelling interest, such as in the entry of nuclear families and refugees, it is not in the national interest to admit unskilled workers. This is especially true when the U.S. economy is showing difficulty in absorbing disadvantaged workers and when efforts towards welfare reform indicate that many unskilled Americans will be entering the labor force.

The Commission is not satisfied with current labor certification procedures because they are neither timely enough to meet the needs of employers with a *bona fide* interest in hiring a foreign worker nor effective in protecting the interests of U.S. workers. We seek to replace a failed and expensive regulatory system with one that is market-driven. (The cost to the federal government was about $70 million in 1992 and is estimated to be about $60 million in 1995.) ***The Commission recommends replacing the labor certification procedure with a more timely and effective labor market test.***

To demonstrate the *bona fide* need for a foreign worker and to increase the competitiveness of U.S. workers, **an employer should**

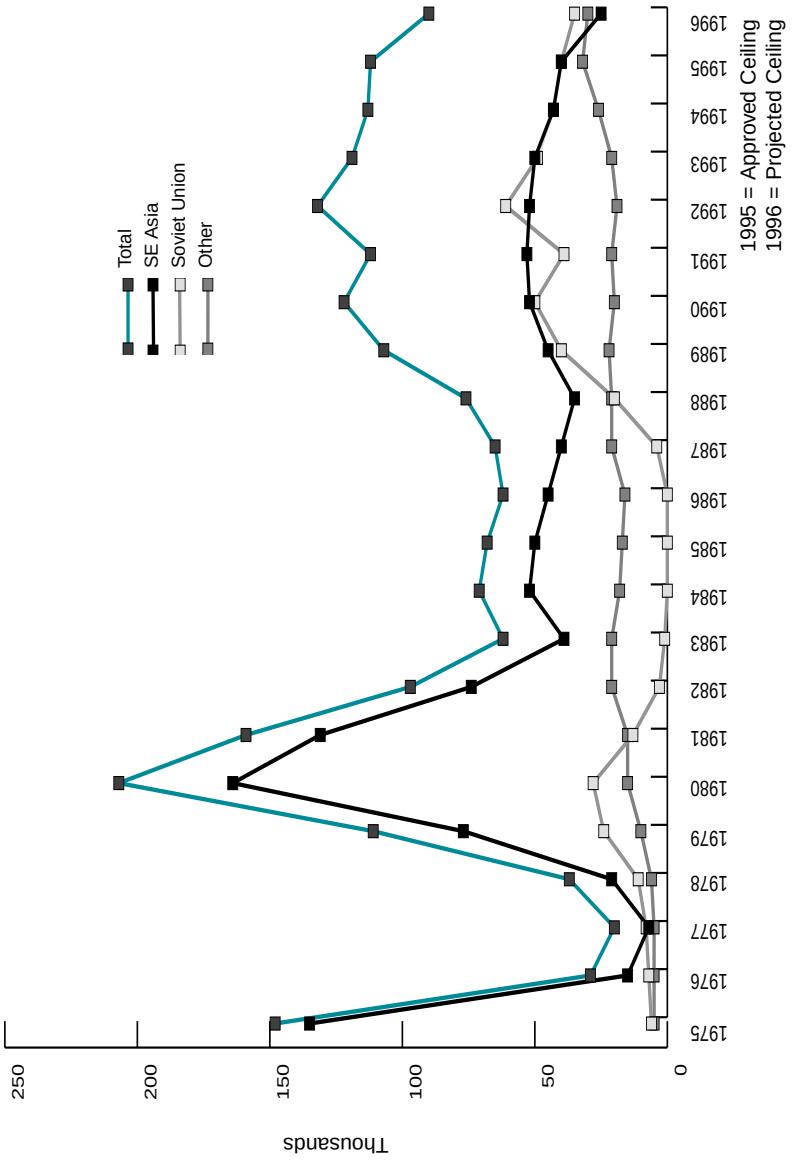
be required to pay a substantial fee, that is, make a substantial financial investment into a certified private sector initiative dedicated to increasing the competitiveness of U.S. workers, for example through education and training. Employers seeking to hire foreign workers already incur substantial financial costs and face lengthy processing delays. Under the Commission's proposal, the fee would go towards developing a well-trained U.S. workforce rather than supporting costly bureaucratic processes. To ensure that the employer, and not the foreign worker, pays the fee, penalties should be imposed upon violators.

Employers should demonstrate that they have engaged in appropriate attempts to find a qualified U.S. worker using normal company recruitment procedures that meet industry-wide standards and offering wages that are at least 5 percent above the prevailing wage.

The resulting permanent resident status so obtained should be conditional for a two-year period. Conditional status would be removed at the end of that period if the foreign worker is still employed by the same employer at the same or higher level and if the employer demonstrates that the attested wage has been paid. The law should specify conditions under which the foreign worker could obtain a waiver of the two-year requirement. For example, it could be waived in situations where unanticipated circumstances, such as layoffs or business failure, occur or where an employer's unfair labor practices would render the foreign worker subject to abuse. To prevent both fraud and abuse against workers, penalties should be authorized.

To provide greater flexibility and allow for market adjustments, the Commission recommends that skill-based visas not used in a fiscal year be carried over to the next year's skill-based numbers.

Refugee Admissions: 1975-1996



Source: U.S. Department of State, Bureau for Population, Refugees and Migration

Refugee Resettlement

The Commission strongly affirms that the United States should continue its commitment to resettle refugees as one of several elements of humanitarian protection for the persecuted. Refugee admissions fulfill a humanitarian commitment to provide protection and assistance to those who otherwise would be persecuted or endangered. The Commission recommends that, on an interim basis:

The U.S. should allocate 50,000 admission numbers each year to the entry of refugees from overseas (not including asylum adjustments);

Other than in emergency situations, refugee admissions could exceed the 50,000 admissions level only with more direct and affirmative participation by Congress than occurs in the current consultation process;

In the case of an emergency, the President may authorize the admission of additional refugees upon certification of the emergency circumstances necessitating such action. The Congress may override the emergency admissions only with a two-house veto of the Presidential action.

Refugee resettlement and other humanitarian admissions fulfill a commitment to provide protection and assistance to those who otherwise would be persecuted or endangered.

Allocating a set number of refugee admissions, with provisions to exceed this number in case of an emergency or other changed circumstances, ensures a continued U.S. commitment to resettlement, particularly following the expected closure of the current refugee programs in Southeast Asia and, possibly, the former Soviet Union. These two programs account for almost 80 percent of current resettlement (about 87,000 out of 112,000 admissions in FY 1994).

Reform of the current consultation process is needed to ensure Congressional oversight of decisions made to exceed the 50,000 limit.

The U.S. should take leadership in generating international responses to refugee crises, with particular focus on international burdensharing and regional solutions.

Current consultations are often *pro forma* and occur very late in the planning process. As discussed below, the Commission will provide recommendations on mechanisms for decisionmaking on numbers in a forthcoming report.

The U.S. should take leadership in generating international responses to refugee crises, with particular focus on international burdensharing and regional solutions. Future policies also must take into account the relative weight to be given resettlement versus the other avenues open to the United States to help protect and assist refugees worldwide, including support for repatriation of refugees to their homelands when conditions permit.

The Commission recommends a thorough assessment of the criteria used to admit refugees for resettlement and the procedures for their admission. The contexts for making future policy regarding refugee resettlement are in flux. The refugee resettlement program must be revamped to meet the needs of a post-Cold War world. Today extreme nationalism and ethnic conflicts produce massive population displacements while resolution of other conflicts is permitting large-scale voluntary repatriation. Resettlement criteria should take into account the protection of refugees who otherwise would be endangered in a country of origin or asylum and who would have no other alternatives.

The Commission is reviewing a variety of issues related to refugee resettlement, including: the priority system; in-country refugee processing; country-specific legislation; procedural issues; congressional and Executive Branch roles, including the consultation process; the role of international organizations; parole authority; and domestic assistance, including the role of the state and local organizations (e.g., nongovernmental organizations and voluntary agencies).

Specific recommendations on refugee resettlement—which may include modification of the above interim recommendations—will be included in a future Commission report. This report also will include recommendations related to immigration emergencies.

Nonimmigrant Admissions

The Commission believes that both permanent and temporary (nonimmigrant) admissions must be considered as part of an integrated immigration system. Although we are deferring specific recommendations on most nonimmigrant issues until we have completed a comprehensive review, we do note two areas of particular interest.

Temporary Workers and Foreign Students. The Commission intends to examine in depth the nonimmigrant temporary worker and foreign student systems and their relationships to permanent immigration. In particular, we will be looking at ways to simplify and achieve greater coordination in these systems and to make recommendations as a result of this study. A high percentage of applicants for permanent skill-based admission are already in this country on temporary work or student visas. Businesses that intend to petition for permanent visas for new hires frequently obtain temporary visas first because of long delays in processing. In addition, a significant number of individuals admitted for temporary study or work seek permanent jobs during their stay. As noted above, these categories of temporary admission must be seen as integral parts of a coherent legal immigration policy. The Commission will address these specific issues in a later report.

The categories of temporary admission must be seen as integral parts of a coherent legal immigration policy, and the Commission will address these specific issues in a later report.

The Commission is highly skeptical of the need for an agricultural guestworker program.

Agriculture Guestworker Program. ***The Commission believes that an agriculture guestworker program, sometimes referred to as a revisiting of the "bracero agreement," is not in the national interest and unanimously and strongly agrees that such a program would be a grievous mistake.***

First, the Commission is highly skeptical of the need for an agricultural guestworker program at this time or in the near future. Proponents of such a program have failed to demonstrate that a labor shortage is about to occur or that there are no means other than a guestworker program available to agricultural producers to obtain sufficient employees in their industry.

Guestworker programs effectively expand rural poverty. Moreover, guestworker programs are predicated on limitations on the freedom of those who are invited to enter and work. Experience has shown that such limitations are incompatible with the values of democratic societies. For that very reason, "temporary" guestworkers tend to become permanent residents, *de facto* or even *de jure*. The inconsistency between the stated intent of guestworker programs and their actual consequences cannot be ignored by policymakers who seek credibility in a reformed system.

Americanization

The Commission supports effective Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy, and equal opportunity. The United States is one of the most successful multiethnic nations in history. It has united immigrants and their descendants from all over the world around a commitment to democratic ideals and constitutional prin-

ciples. Those ideals and principles have been embraced by persons from an extraordinary variety of religious and ethnic backgrounds, partly because they permit and protect religious and cultural diversity within a framework of national political unity.

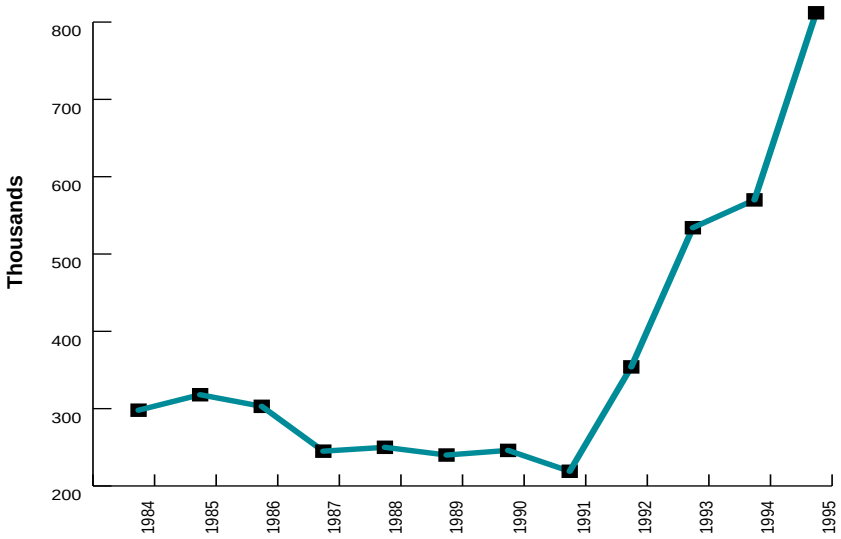
Religious and cultural diversity does not pose a threat to the national interest as long as public policies ensure civic unity. Such policies should help newcomers learn to speak, read, and write English effectively. They should strengthen civic understanding in the teaching of American history for all Americans. They should lead to the vigorous enforcement of laws against hate crimes and of laws to deter and to punish discrimination. Of course, such policies should encourage the naturalization of immigrants as the path to full civic participation.

At the same time, immigration to the United States should be understood as a privilege, not a right. Immigration carries with it obligations to embrace the common core of the American civic culture, to become able to communicate—to the extent possible—in English with other citizens and residents, and to adapt to fundamental constitutional principles and democratic institutions.

In its further deliberations, the Commission will consider other public policies that are believed by some to encourage ethnocentrism in the name of multiculturalism or to promote political separatism in the name of civil rights. For example: Do bilingual education and affirmative action as applied to immigrants and their children promote or diminish civic unity? Now that immigrants come from more than 160 nations and many more ethnic groups, it is extremely important that public policies facilitate, not inhibit, the Americanization of newcomers.

American democratic ideals and constitutional principles have been embraced by persons from an extraordinary variety of religious and ethnic backgrounds, partly because they permit and protect religious and cultural diversity within a framework of national political unity.

Naturalization Applications Filed Nationwide



Source: Immigration and Naturalization Service
Statistical Yearbook of the INS 1993

Naturalization is the most visible manifestation of civic incorporation. At present, there is greater interest in naturalization than there is a capacity to act upon this interest. Large backlogs must be overcome so that the nation can benefit from the growing commitment of immigrants to become American citizens.

The Commission strongly recommends that INS adopt and implement as a strategic goal the reduction of processing time and backlogs for naturalization while maintaining rigorous standards in processing applications. The Commission also urges Congress to appropriate sufficient resources to support the implementation of this strategic goal. Applicants for naturalization pay a fee designed to cover the costs of the application process. The fees go into an account dedicated to use for examinations. The Commission believes that naturalization applicants have the right to receive the timely

service that their fee represents. Naturalization fees should not subsidize other activities. Nor should an efficient naturalization procedure require a reallocation of resources from other priority functions. If the current fee is not adequate to cover the full costs of timely naturalization, it should be increased appropriately. Further, the Commission urges INS to:

Set a standard reasonable time frame for processing naturalization applications. The time frame should permit timely review of applications without lowering the standards for civics and English language knowledge or compromising the required background checks. The INS also should improve processes and policies, as well as allocation of resources, to establish a level of efficiency that can withstand fluctuations in volume.

Continue to recruit national and community-based organizations, both public and private, as well as employers, to assist in facilitating smooth operation of the processing of naturalization applications. These organizations have proved very helpful in prior partnerships with INS in: overseeing proper completion of applications; taking security check fingerprints; serving as testing sites for the required English and civics examinations; briefing applicants on procedures; providing less intimidating final interview sites; and reviewing files before interviews to make certain that examiners need spend time only on substantive interview issues.

Ensure that there are adequate numbers of personnel to complete naturalization processing efficiently. To reduce waiting periods in districts with backlogs, INS should reassign personnel and, where appropriate, designate examiners who will do naturalization interviews exclusively. In instances where an interview can be waived, INS should permit naturalization appli-

cations to be filed, reviewed, and approved at one of its four Regional Service Centers.

Carefully scrutinize the naturalization applications of all Special Agricultural Workers [SAW] to assure that their original SAW status was properly granted. Reports of widespread fraud in this program require such special attention to applications for U.S. citizenship by SAW legalization beneficiaries.

The Commission urges both the public and private sectors to assist legal immigrants in their preparation for naturalization.

The Commission urges private industry, churches, community groups and individual volunteers to redouble their efforts to provide English language instruction and civics education to immigrants. The current increased interest in naturalization presents an opportunity to use instruction in English, U.S. history, and civics to help immigrants participate more fully in the life of the community. Private sector initiatives would fill current gaps in such services. These programs also would benefit the providers, particularly businesses, who would gain from a workforce better able to communicate in English.

The Commission supports targeted outreach programs aimed at informing eligible immigrants about the requirements for naturalization. Outreach programs are critical to civic incorporation. They encourage immigrants to want to become citizens and help ensure awareness of opportunity and equitable access to information about naturalization.

CONCLUSION

These interim conclusions and recommendations on legal immigration to the United States are a first step in the Commission's examination of the implementation and impact of our legal immigration system. Together with our earlier recommendations on illegal immigration, they seek to restore credibility to our immigration policies.

This report defines the national interest in immigration. It outlines mechanisms that permit the expeditious entry of those who are of highest priority for admission while mitigating potential harmful effects on U.S. communities and vulnerable populations.

The Commission continues our longer-term investigation of the impact of legal immigration on the United States. Based on the results of these studies, the Commission expects to make further recommendations on legal immigration in our final report to Congress in 1997.

This report outlines mechanisms that permit the expeditious entry of those who are of highest priority for admission while mitigating potential harmful effects on U.S. communities and vulnerable populations.

U.S. Refugee Policy: Taking Leadership

A Report to Congress

JUNE 1997

U.S. COMMISSION ON IMMIGRATION REFORM

June 5, 1997

The Honorable Newt Gingrich, Speaker of the House of Representatives
The Honorable Richard A. Gephart, Minority Leader of the House of Representatives
The Honorable Trent Lott, Majority Leader of the Senate
The Honorable Thomas A. Daschle, Minority Leader of the Senate

On behalf of the U.S. Commission on Immigration Reform, it is my pleasure to submit our interim report on U.S. refugee policy.

This Commission was mandated by the Immigration Act of 1990 [Public Law 101-649] to examine and make recommendations regarding the implementation and impact of U.S. immigration policy. Refugee admissions, mass migration emergencies, and asylum constitute important components of U.S. immigration policy that must be considered in the context of both their domestic and international ramifications.

To learn about the domestic effects of U.S. refugee policy, the Commission held public hearings and consultations in such diverse sites as Seattle, Washington; Orange County and Fresno, California; St. Louis, Missouri; Lowell, Massachusetts; and Miami, Florida. To better understand the international aspects of our policies, the Commission undertook site visits to Bosnia, Croatia, Germany, Haiti, Cuba, and Kenya, in addition to holding discussions with representatives of the U.N. High Commissioner for Refugees [UNHCR] and the International Organization for Migration [IOM] in Geneva and in field offices.

The U.S. is entering an era that requires changes in our refugee policy. The end of the Cold War has ushered in new challenges along with new opportunities to promote policies that address the causes and consequences of refugee movements. The recommendations in this report promote a comprehensive and coherent U.S. refugee policy that will permit the U.S. to assert international leadership and implement responsible

domestic programs. The U.S. government must have the capacity to detect the causes of the movements early on to better prevent them through political, diplomatic, and economic initiatives; to assist in caring for and protecting the refugees overseas who are forced to leave their countries; to resettle effectively the few for whom U.S. resettlement is the only or best option; to adopt a viable plan to respond to mass migration emergencies that immediately affect our own nation; and to operate an effective asylum system that protects the *bona fide* refugee while deterring those who are not. Because domestic and international policies affect and are affected by each other, this report emphasizes the need for White House leadership in coordinating and overseeing decisionmaking on refugee policy throughout the federal government.

The Commission could not have produced this report without the cooperation of the Executive Branch and both Houses of Congress. We look forward to working with the Senate and House subcommittees responsible for immigration and refugee policy, as well as the federal agencies responsible for administering our refugee programs. The Commission also thanks the many representatives of state and local government and private agencies who shared their experiences and perspectives regarding refugee policy and its implementation.

Our special thanks go to the UNHCR and IOM for making our overseas site visits so productive. The field staff of these international agencies, along with the nongovernmental agencies with whom they work in providing assistance to refugees, displaced persons, and returnees, truly exemplify professionalism and competence, often under the most trying circumstances. We hope these recommendations will help them in their important work.

Sincerely,

Shirley Mount Hufstedler

U.S. COMMISSION ON IMMIGRATION REFORM

INTRODUCTION

Since its very beginnings, America has been a refuge for the persecuted—a "city on the hill" beckoning the victims of political, religious, ethnic, and other forms of repression. That tradition continues to this day. Through both our admissions policies and, equally importantly, through our support for international protection and assistance, the United States leads the world in responding to refugee and related humanitarian crises.

Since its very beginnings, America has been a refuge for the persecuted—"a city on the hill" beckoning the victims of political, religious, ethnic, and other forms of repression.

On its overseas site visits, the Commission witnessed the desperate plight of those forced to flee their homes. Existence in refugee camps is often tenuous. The Somali women of Dadaab, Kenya refugee camp, for example, face frequent rapes and assaults; many Sudanese adolescent males are dying from malnutrition-caused anemia; youngsters are forcibly recruited for military service; children born and raised in refugee camps have little hope for the future.

We also observed the daunting challenges faced by refugees able to return to their home countries. Though the Dayton Accords signaled the formal end to conflict in the former Yugoslavia, many refugees' homes, local schools, and medical facilities were destroyed; others are no longer welcome or safe in their old neighborhoods because a different ethnic group has taken them over. Haitian refugees have returned to greater political freedom, but their problems are far from over as their government tries to address the damage done by years of exploitation and neglect.

As new emergencies arise, and as new possibilities to avert or resolve refugee crises emerge, U.S. leadership faces new challenges and new opportunities. With the end of the Cold War, millions of refugees have been able to return to their countries of origin. Many more have been forced to leave their homes. In the 1990s, complex factors precipitated the population displacements in and from such

What is International Protection?

Most people can look to their own government to guaran-tee and protect their basic human rights and physical security. But in the case of refugees, the country of origin has proved itself unable or unwilling to protect those rights. UNHCR is mandated to ensure that refugees are protected by their country of asylum, and assists that government as far as possible in that task.

. . . [S]tates may not refoule, or forcibly return, refugees to a territory where they face danger. They may not dis-criminate between groups of refugees. They should ensure that refugees benefit from economic and social rights, at least to the same degree as other foreign residents of the country of asylum. Finally, states have an obligation to cooperate with UNHCR. And, for humanitarian reasons, states should permit the admission of at least the spouse and dependent children of any person to whom temporary refuge or asylum has been granted.

varied places as Bosnia, Rwanda, Liberia, Afghanistan, Chechnya, and Albania. These complex movements require equally complex responses both to resolve the existing crises and to avert future emergencies. Repatriation, reconstruction, and democracy-building efforts in Central America, Cambodia, Haiti, Bosnia and elsewhere point to the significant investment in time, money, and personnel required to bring stability to these troubled areas and, thereby, avert future crises.

The vast majority of the refugees and displaced persons from these and other countries remain within their own region. Increasingly, they are internally displaced within their own countries. The U.S. Committee for Refugees [USCR] estimates that at present there are 14.5 million refugees and asylum seekers worldwide, with almost 19 million additional persons who are internally displaced [IDPs]. By contrast, in the early 1980s, USCR counted fewer than 10 million refugees worldwide and did not even estimate the number of IDPs. While most refugees fall under the United Nations High Commissioner for Refugees [UNHCR] mandate, only a small minority of the internally displaced persons receive international assistance and protection. They become of concern to the UNHCR as a result of a request from the Secretary General or competent organs of the United Nations or because of their proximity to assisted refugee and returnee populations. The UNHCR reports 26 million "persons of concern"—including more than 13.2 million refugees, 4.6 million internally displaced persons, 3.3 million returnees still in need of assistance and protection, and 4.9 million other persons of concern.

Resident of Gasinci refugee camp in Bosnia [Photo: CIR staff]

By contrast, even the largest U.S. resettlement program of the past two decades—that of Southeast Asian refugees—brought no more than 168,000 refugees to this country in any one year. During the same period, the U.S. generally saw fewer than 100,000 asylum seek-

Chart 5.
Major Destinations of Refugees and Asylum Seekers: 1996

Source: U.S. Committee for Refugees. *World Refugee Survey, 1997.* [*Number reported from sources varies widely.]

ers per year come directly to our shores. This is not to say that these arrivals do not have profound consequences both positive and negative for the U.S. communities in which they reside. The Mariel boatlift in the early 1980s saw more than 125,000 Cubans arrive within weeks. Similarly, the more sustained movements of refugees from southeast Asia and the former Soviet Union continue to pose challenges and provide opportunities to this country. Nonetheless, the comparison between the number of international refugees and the numbers of those resettled in the U.S. underscores that nearly all refugees will remain outside of this country—a reality that U.S. refugee policy must reflect.

A majority of the world's refugees are in Africa and the Middle East. By USCR's count, Africa has more than 3.6 million refugees (down from 5.2 million in 1995 largely because of the recent return of Rwandans from Zaire [now Congo]) and the Middle East almost six million. Major source countries in Africa include Rwanda, Burundi, Liberia, Somalia, Sierra Leone, Sudan, and Eritrea. Each of these countries also has large numbers of internally displaced persons and returnees. Afghans, Iraqis, and Palestinians represent the major refugee groups in the Middle East. Europe follows with more than two million refugees, largely from the former Yugoslavia. South and Central Asian countries host another one million plus refugees, primarily from Afghanistan. Perhaps because of growing support for democracy, there has been a marked downturn in refugee movements in East Asia, Latin America, and the Caribbean, with exceptions such as the flight of Burmese to Thailand.

Despite the small percentage of the world's refugees who can be resettled in the United States, U.S. resettlement policies nevertheless can greatly influence the international response to refugees. U.S. pledges of resettlement and support for the protection mandate of UNHCR encourage other nations to provide first asylum to new arrivals and serve as an example to other resettlement nations.

Who Is a Refugee?

[A refugee is] any person who is outside any country of such person's nationality, or in the case of a person having no nationality, is outside any country in which such person last habitually resided, and who is unable or unwilling to return to, and is unable or unwilling to avail himself or herself of the protection of, that country because of persecution or a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion, or . . . any person who is within the country of such person's nationality . . . and who is persecuted or who has a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion. The term "refugee" does not include any person who ordered, incited, assisted, or otherwise participated in the persecution of any person on account of race, religion, nationality, member-ship in a particular social group, or political opinion.

Immigration and Nationality Act Section 101a(42)

Conversely, other countries point to U.S. decisions to interdict and return individuals without screening their claims about persecution as justification for their own refusal to accept asylum seekers.

U.S. adherence to international norms for the protection of refugees is essential to a well-functioning international system. The Commission believes U.S. policies should recognize that persons in life-threatening situations or subject to serious bodily harm who do not qualify under the refugee definition may also need protection and assistance from the United States.

The recommendations in this report support a comprehensive and coherent U.S. refugee policy that will permit the U.S. to assert international leadership and implement responsible domestic programs. The U.S. government must have the capacity to detect the causes of the movements to better prevent them through political, diplomatic, and economic initiatives; to assist in caring for and protecting the refugees overseas who are forced to leave their countries; to resettle the few for whom U.S. resettlement is the only or best option and provide sensible transitional assistance to them; to operate an effective system for protecting *bona fide* asylum seekers in the U.S. while deterring those who are not; and to adopt a humane and effective plan to respond to mass migration emergencies that immediately impact our own nation. Because domestic and international policies affect, and are affected by, each other, this report also emphasizes the need for White House leadership in coordinating and overseeing decisionmaking on refugee policy throughout the federal government.

RECOMMENDATIONS

A FOCAL POINT FOR U.S. LEADERSHIP

Demonstrating leadership in a new era requires that the U.S. government develop a coordinated, comprehensive approach to refugee policy and its implementation. This leadership will exert maximum effect if it comes from the White House.

The Commission recommends the designation of an office within the National Security Council to serve as the White House focal point for overseeing and coordinating all aspects of U.S. policies regarding domestic and international refugee and related humanitarian issues. The responsibility for refugee and related humanitarian issues now is divided among agencies scattered among several Cabinet-level departments. For example, the Department of State has lead responsibility for setting and implementing policies related to international refugee and humanitarian assistance and protection. The Department of Justice sets and implements asylum policy and the Department of Health and Human Services oversees the domestic assistance program for resettled refugees. Each department faces separate issues, but their overlapping areas of interest necessitate a high level of coordination to accomplish smooth, effective operations.

The National Security Council, in consultation with the Domestic Policy Council, is particularly well-suited to make sure that appropriate weight is given to national security, foreign policy, domestic interests, and humanitarian concerns.

When refugee crises emerge, more than coordination is needed. Generally, only the President can make the final decision to put U.S. diplomatic, financial, and even military resources behind efforts to address major crises such as those that have occurred in the Great Lakes region of Rwanda, Zaire [Congo], and Burundi, and in Bosnia, Somalia, and northern Iraq.

Designation of a focal point within the National Security Council [NSC] will help ensure that the President receives the best intelligence needed to make informed decisions during international cri-

ses and mass migration emergencies involving U.S. borders and ports. The NSC, in consultation with the Domestic Policy Council, is particularly well-suited to make sure that appropriate weight is given to national security, foreign policy, domestic interests, and humanitarian concerns. The NSC focal point would have an opportunity to assess and comment on the implications of various policy decisions for possible humanitarian crises, as well as alert the President and Cabinet members to looming crises that require early attention. The NSC has the confidence of the President in policy judgments and it can bring the key Executive Branch decisionmakers to the table in critical situations.

Bosniac children at Gasinci refugee camp [Photo: CIR staff]

The Administration has taken steps in this direction with the designation of a Special Assistant to the President and Senior Director of the National Security Council for Democracy, Human Rights, and Humanitarian Affairs. Responsibility for refugee policy should be institutionalized at the NSC. And, the office should be provided the necessary resources and personnel to coordinate federal programs related to early warning of refugee and related humanitarian emergencies, preventive actions that address the causes of such crises, humanitarian assistance to refugees and internally displaced persons, U.S. resettlement of refugees, migration emergency planning, U.S. asylum and temporary protection policies, and domestic assistance for refugees and others of humanitarian concern. The aim of the NSC office should be to maximize consistency in policy formulation on domestic and international issues, enhance coordination among the lead agencies in developing and implementing policies that cross lines of authority,[1] clarify accountability through a

[1] For example, through the formulation of a national strategy paper addressing all refugee issues.

coordinated review of appropriation requests of agencies implementing refugee programs, and expedite the appropriate tasking of agencies when an emergency arises.

INTERNATIONAL REFUGEE POLICY AND PROGRAMS

With the vast majority of the world's refugees and displaced persons remaining overseas, the U.S. must focus first and foremost on international refugee policy and programs. Our leadership can take many forms, including policy direction and guidance in international *fora*, financial contributions to assistance and protection programs, and last but not least, the example set through our own domestic refugee resettlement and asylum policies.

The Commission urges the federal government to continue demonstrating leadership in generating international responses to refugee and related humanitarian crises. The vast majority of the world's refugees and displaced persons are outside of the United States. The Commission is charged with taking a broad view of U.S. refugee policy to include not only domestic but also international policies and programs. The leadership the U.S. provides in responding to international crises is a key component of our refugee policy. The number of refugees and displaced persons requiring international assistance and protection continues to grow. Thus, the need for a continued, effective U.S. response remains. U.S. refugee policy should:

The number of refugees and displaced persons requiring international assistance and protection continues to grow. Thus, the need for a continued, effective U.S. response remains.

- **Anticipate and take action, when possible, to prevent** refugee and related humanitarian emergencies from occurring;

- **Respond in a timely, humanitarian, and effective manner** when their prevention is not possible;

- **Facilitate protection of and assistance to refugees** regardless of their location—that is, in countries of first asylum as well as at the border and in the interior of the United States;

- **Endeavor to ensure, to the extent practicable, humanitarian aid and protection to those who are internally or externally displaced** by other situations that threaten life or liberty; and

- **Seek durable solutions** (repatriation, local integration, or third-country resettlement) for those who require international protection and assistance so as not to perpetuate long-term refugee displacements.

Somali women residents of Kakuma refugee camp in Kenya [Photo: CIR staff]

The United States should serve these goals through:

- **Preventive diplomacy and other actions** that address the causes of refugee and related humanitarian emergencies and, thereby, reduce the likelihood of their occurrence;

- **Policy leadership** in the international refugee system through which the vast majority of refugees receive assistance, protection, and durable solutions;

- **Timely and appropriate finan-cial contributions** designed to address the causes, conse-quences, and solutions to refugee and related humanitarian emergencies;

- **Support for programs that target assistance and protection to the most vulnerable populations**, with particular regard for the needs of women and children who comprise the vast majority of the world's refugee and displaced populations; and

- **Clear, comprehensive, and consistent domestic refugee policies** that adhere to recognized international norms for the protection of refugees and others facing life-threatening situations.

The Commission reinforces the need for creative approaches to address issues that are now impeding effective responses to international refugee and related humanitarian emergencies. The most pressing of these are:

- **Early Warning of Humanitarian Crises.** Most humanitarian emergencies that generate large-scale movements of refugees and other displaced persons are predictable to some degree. Many people know that a potential crisis is brewing long before the first persons take flight. The key is to transform such generalized knowledge into the specific information needed for action plans to prevent the crisis, if possible, or to respond more effectively and quickly if not.

- **Preventive Actions.** Even more problematic than the capacity to sound early warnings is the will and capacity among national and international agencies to respond to them. Preventive action can involve a wide array of strategies, ranging from diplomacy, to economic sanctions to, as last resort, military intervention. While the United States is not the only country with the capacity to take such actions, our unique role as the remaining superpower makes it imperative that we understand how to use these tools most effectively and when it is in our national interest to do so.

Food distribution at Dadaab refugee camp in Kenya [Photo: CIR staff]

- **Emergency Responses.** Unfortunately, the circumstances that cause humanitarian emergencies often cannot be prevented. Despite decades of experience, however, emergency responses typically are "too little, too late." Prompt and effective responses can decrease illness and death resulting from starvation, overcrowding, disease, and lack of shelter. Early responses can limit the security risks to neighboring countries that sometimes result from the large-scale movements of people during conflict. And, they can diminish the later cost of addressing the consequences of failed assistance and protection policies.

- **Internally Displaced Persons.** Few humanitarian issues generate greater controversy and require more leadership than the situation of internally displaced persons who seek refuge within the borders of their own country. More individuals are internally displaced because of repression and conflict than have sought or obtained refuge in other countries. In some cases, they remain in danger in their own countries because of an unwillingness on the part of

neighboring countries to permit them to enter and seek asylum. Above all, there is a need for a clearer picture of the rights of IDPs to protection and assistance and the responsibilities of states and the international community towards them. More effective strategies to reach and provide assistance and protection to IDPs should be developed. These strategies should include guidelines and rules of conduct to help determine when, under what circumstances, and by whom to provide aid to IDPs and to help ensure that aid does not become politicized or serve to fuel a conflict.

■ **Protection of Aid Workers.** In recent years, staff of the international organizations, government agencies, and nongovernmental organizations providing assistance to refugees and internally displaced persons have come under deadly attack. Agencies such as the International Committee of the Red Cross [ICRC] that have had long histories of operating safely on both sides of conflicts are now increasingly the targets of armed reprisals from military and paramilitary forces. Sometimes the attacks have led to the death of humanitarian aid providers and forced others to depart, leaving refugees and IDPs without outside help. Violent attacks upon humanitarian workers are wholly unacceptable; the protection of aid workers must be given high priority if effective assistance and protection is to occur.

Rwandan refugees return from Tanzania. [A/P/Wide World Photos]

■ **Durable Solutions for Refugees and Internally Displaced Persons.** The decade of the 1990s has seen the end to many refugee

and related humanitarian crises. Yet far too many inidividuals remain externally or internally displaced because of continuing conflict or repression in their home countries. Expanding repatriation opportunities while promoting local integration and third-country resettlement for those who cannot return home will help ensure that millions of refugees are not left without permanent solutions to their plight.

- **Institutional Roles and Relationships.** A number of these issues fall between the cracks of the U.S. government and international systems, producing conflicts or leaving gaps in institutional responsibility. Sometimes, too many agencies vie for participation; at other times no one steps forward to assume responsibility. Too often, the few agencies willing and able to assist and protect the victims of humanitarian crises become overextended. U.S. leadership in setting out a more effective humanitarian response system would help correct these problems.

- **International Responsibility.** A broader sharing of responsibility and commitment towards refugees will increase the effectiveness of responses to refugee and related crises. No one country, the United States included, has either the resources or the capacity to undertake all of the tasks necessary to prevent or respond effectively to refugee crises. The United States should lead efforts to develop more effective mechanisms for sharing of responsibility among nations able to do so.

As a matter of urgency, the Commission calls on the President to establish a senior-level taskforce, under the leadership of the NSC, to set criteria and guidelines for the involvement of U.S. military forces in humanitarian operations related to refugees and IDPs. In the past, the U.S. military occasionally has been involved in providing humanitarian assistance

to victims of conflicts or natural disasters. Since the end of the Cold War, however, as crises continue but superpower conflicts no longer impede international action, the U.S. military has been involved in numerous complex contingency operations. These have involved humanitarian as well as the more typical political and security aspects (e.g., Iraq, Somalia, Haiti, former Yugoslavia, etc.). The U.S. military also has continued to provide critical logistical support to the increasing numbers of humanitarian operations. Military resources and facilities have even been used to interdict and, in the case of Guantanamo Naval Base, to process and protect migrants.

U.S. military loads flour for Sarajevo [Department of Defense photo]

The military is likely to continue to be involved in humanitarian operations, at least in the near future. Although the U.S. government has developed criteria for the participation of military forces in peacemaking and peacekeeping operations, similar guidelines have not yet been promulgated for the broader array of humanitarian operations to provide assistance and protection in situations related to refugees or IDPs.

These situations pose specific challenges that go beyond those encountered in providing logistical support. For instance, a humanitarian response to flood victims may only require airlifting supplies or feeding people. Though such efforts can require demanding logistical planning and difficult operations, they tend to be far less complex than negotiating access with warlords, preventing the hijacking of supply convoys, or defending the lives of relief workers—all of which occur in protection situations. The crisis in Zaire [Congo] highlights the many complex issues. Rwandan refugees have been threatened not only by the domestic Zairian [Congo] conflict but also by Rwandan military and militia forces operating in Zaire

[Congo]. The plan for a multinational humanitarian force, including U.S. military, was put on hold in December 1996 when the majority of Rwandan refugees repatriated spontaneously, but as of the spring of 1997, the situation remained fluid with several hundred thousand refugees remaining in Zaire [Congo], largely out of reach of humanitarian refugee assistance.

The proposed taskforce would cover such issues as: recommending criteria for determining if and when military intervention is in the U.S. national interest; developing criteria for initial engagement and later disengagement; formulating a code of conduct during deployment to include, at a minimum, an absolute right of self-defense; analyzing the effects of the humanitarian assistance on the situation on the ground; evaluating the interaction between the humanitarian operations and political and diplomatic efforts; devising necessary training; delineating agency responsi-bilities and a chain of command; and clarifying funding issues. Among others, the taskforce should include the Secretary of State, the Secretary of Defense, the Chairman of the Joint Chiefs of Staff, and the Director of Central Intelligence, as well as key leaders of Congress, inter-national and nongovernmental organiza-tions and religious institutions.

MASS MIGRATION EMERGENCIES

The Commission reiterates its view (expressed in its 1994 report) that a credible immigration policy requires the ability to respond effectively and humanely to migration emergencies in which large numbers of people seek entry into the United States. Failure to act appropriately and

in a timely manner can have profound humanitarian consequences. Further, an uncontrolled emergency can overwhelm resources and create serious problems that far outlast the emergency. The Commission believes that the recommendations below will facilitate the ability to respond effectively and humanely.

Failure to act appropriately and in a timely manner during mass emergencies can have profound humanitarian consequences, overwhelm resources, and create serious problems that far outlast the emergency.

The Commission recommends establishment of a regional temporary protection system. The creation of a regional protection system is by far the best option to provide temporary protection outside of the U.S. to individuals fleeing armed conflict and/or upheavals that pose serious threats to life or liberty. The U.S. government learned valuable lessons during the Haitian and Cuban migrations in 1994. First, we can and should protect those fleeing oppressive regimes or life-threatening danger. Second, we can and must do so without precipitating the migration or admission of large numbers of those who only seek a better economic life in the U.S. Third, we can engage regional neighbors in providing protection. The Commission believes that the U.S. should build on this experience now so that, in accordance with both our commitment to humanitarian principles and our role as an international leader on refugee policies, we can make all feasible efforts to protect, at least on a temporary basis, individuals who fear return to their home countries because of armed conflict and other serious civil disruptions.

The U.S. should be working hard now—when we are not immediately affected by a mass migration crisis—on ways to address the political, fiscal, and technical problems that may impede efforts to establish a regional system to deal with likely future crises. Establishing such a system will take time, high level political involvement, and the potential commitment and leverage of U.S. financial and other resources. A regional protection system would require the countries of the Americas and the Caribbean to negotiate and agree upon several key elements:

- **Sites**. Various locations would be needed depending on

the size of the emergency movements, their proximity to the source country, and geopolitical sensitivities regarding a particular emergency. In addition, regional partners are likely to expect each other to do more than provide funding or logistical assistance to the system. Sites in two or three countries near the source country would likely be the primary protection locations. Negotiations on establishing a regional protection system should address minimum requirements for such sites in terms of overall conditions, access to medical and other services, presence of nongovernmental organizations, specific policies related to unaccompanied minors and women-at-risk, and other similar issues.

The U.S. should be working hard now—when we are not immediately affected by a mass migration crisis—to establish a regional system to deal with likely future crises.

The U.S. may have to be prepared to provide a location for use by the regional system. Until the U.S. develops the capacity and legal framework that would allow it to provide truly temporary protec-tion to large numbers within our territory, Guantanamo Naval Base should continue to be used in responding to mass migration emergen-cies. The base is the only offshore site that the U.S. currently can offer if called on by our regional neighbors to contribute territory it controls to a regional protection system. Further, Guantanamo appears to be the only U.S.-controlled offshore protection site in the region available for situations where the U.S. acts unilaterally to handle emergency movements.

Processing at Guantanamo
[Photo: Ramon Garcia]

Safe havens in the country of origin also should be used to provide protection,

but only as a last resort when all else has proven ineffective in responding to the humanitarian emergency. The risks to life for both protected and protectors have so often outweighed the potential benefits of such in-country protection that only in the most extraordinary circumstances should this option be considered.

- **Plans for Processing of Those Who Reach Borders Beyond the Primary Protection Sites.** Those seeking protection who reach nations further away from the source country could be provided refuge either at one of the primary regional protection sites or within the country that they reach. Those nations, including the United States, concerned that too many individuals might try to reach their country, should be able to find a principled and humanitarian way to determine who among those needing protection should receive it at the primary locations and who within their own borders.

  Temporary protection within a regional protection system is one potential way for the United States to do this. Under this framework, the U.S. would not interdict and directly return asylum seekers in order to prevent their entry in the U.S. Instead, those who arrive at U.S. borders requesting protection would undergo a constitutionally-sound, expedited procedure to determine if they qualify for either asylum or temporary protection. They would have an opportunity to make claims before an Asylum Officer and, if not approved, an Immigration Judge. Those who fail to prove eligibility for either asylum or temporary protection would be returned to their home country. Those who are determined ineligible for asylum, but who qualify for temporary protection, would receive a grant for the latter and be provided protection at one of the primary sites outside the U.S. Those whose claims for asylum require adjudication beyond what can be accomplished within the expedited procedure

would be admitted into the U.S. for regular asylum processing. If they ultimately fail in their asylum claim but are granted temporary protection, they could be allowed to remain in the U.S. as long as the U.S. determined that such protection was warranted.

If, however, experience shows that the availability of such temporary protection in the U.S. creates a magnet effect, protection could be provided at the primary regional sites. In this way, the U.S. could share the regional responsibility of providing temporary protection to some individuals within its own territory without serious concerns that such admissions would lead to a magnet effect.

Migrant interdiction off the Florida coast [U.S. Coast Guard photo]

- **Measures to Avert and Resolve Crises**. It is both humane and pragmatic for the U.S. and its regional partners to be similarly committed to resolving the conditions causing flight. This would require prompt and intensive assessments of the extent to which coordinated diplomatic action can serve to avert mass migration emergencies within the region. Coordinated action may also be helpful in finding solutions to crises that cannot be prevented so that people can return in safety to their home countries.

- **Durable Solutions**. For most protected populations, timely repatriation is the best solution. In accordance with the humanitarian nature of temporary protection, safe return should be accomplished through voluntary means with a combination of financial and development aid incentives. Such aid should be targeted to the communities from which those protected come. The model UNHCR often uses, Quick

Impact Projects [QIPs], provides resources to communities where there was substantial displacement resulting from warfare. QIPs support rehabilitation of local roads, water systems, community health centers, schools, housing, and other infrastructure affected by warfare. QIPs employ both the resident population and the returnees, thereby making the local community more receptive to the return of its residents while providing needed transitional income to both residents and returnees. Compulsory repatriation may be necessary for some individuals, but should be used only when an individual has chosen not to return after being provided with a fair opportunity and appropriate incentives to do so in a safe and voluntary manner.

In some situations, timely return will prove impossible because the conditions causing flight persist despite efforts to resolve the crisis. Coordinated action to find other durable solutions will then be needed. Local integration and third-country resettlement should be considered for individuals whose continued presence in protection sites no longer can be sustained.

- **Financing Plan.** The temporary protection system, in addition to costs incurred by the various government agencies involved, will entail numerous other costs, including "mothball" maintenance of the protection site and their utilization and operation if and when a migration emergency occurs. For example, if the United States were to use Guantanamo, the military would face costs greater than normal maintenance of the base. However, certain costs would be incurred regardless of the presence of aliens seeking protection. Reimbursement formulas need to be developed that take into account the *marginal* additional costs incurred. As part of their advance planning, the countries involved would

have to project what the total costs could be and clarify who would pay which costs and from which budget items.

The Commission recommends that the federal contingency planning for migration emergencies that has been under development during the past decade be finalized, with appropriate provisions to review and revise as needed. Mass migrations are likely to continue within this hemisphere. The presence of a contingency plan that identifies various scenarios, policy responses, and appropriate plans for handling them can help avoid dangerous and costly *ad hoc* decisionmaking and planning, as well as the disruption of normal operations. A great deal of time and effort already have been put into the contingency plan, Operation Distant Shore. Significant improvements in the plan have been made although further changes are needed to make it more useful. These include modifying policy assumptions to reflect changes in U.S. asylum law and regulations and to incorporate the lessons of the most recent responses to movements out of Cuba and Haiti, including the viability of off-shore safe havens and the need for a formalized structure for making policy decisions. Contingency planning also may involve consideration of how to address or ameliorate the causes of the migration so that people do not feel they have no choice but to migrate. The development of a more realistic funding plan [as discussed below] is also needed as part of any contingency plan.

Housing at Guantanamo
[Photo: Kenneth Leutbecker]

The Commission recommends that the NSC focal point for refugee issues assume leadership quickly to ensure a smooth response to an unfolding mass migration emergency. The early establishment of a chain of command is crucial to an effective emergency response. Past experiences demonstrate that the majority of the decisions needed in responding to an emergency are linked to domestic politics and end up at the White House. During the 1994 Cuban and Haitian

migration crises the NSC took an active role in determining and organizing the U.S. government's policy response. To facilitate coordination and to use the emergency powers, authorities, and funds available to the President, the focal point must have access to the highest levels of the Executive Branch and have sufficient authority and government experience to be able to carry out the responsibility effectively. Institutionalizing this responsibility within the Executive Office of the President would help ensure that the designated individual is involved in the identification of potential crises and formulation of a coordinated U.S. response. By exercising leadership in the planning process prior to the emergency, the NSC will help ensure continuity between planning and implementation after an emergency has begun.

The Commission urges increased coordination among federal agencies involved in emergency responses as well as with state and local agencies and regional and international organizations. Increased coordination within the federal government would help ensure that the appropriate participants are identified and involved in the discussions and that as many decisions and responsibilities as possible are agreed upon prior to emergency situations. Such prior agreements between the federal government and state and local agencies could eliminate many of the sources of tension and confusion that currently exist about roles and responsibilities. This would reduce the reluctance of state and local government to be involved, increase trust between the parties, and thus facilitate responses to mass migration emergencies. Moreover, some state and local governments have knowledge and experience that would enhance the quality of the planning process. Fortunately, progress is being made. The Immigration and Naturalization Service [INS] and the Federal Emergency Management Agency [FEMA] are negotiating a Memorandum of Understanding clarifying how FEMA would support INS in an immigration emergency. Recent field exercises have increased the active participation of state and local officials. Increased coordination with our regional partners and international agencies prior to a migration

emergency (as suggested above) would help focus attention on addressing the causes of such mass migrations, clarifying responsibilities, and creating infrastructures, mechanisms, and guidelines to deal with any crisis that does occur. This would facilitate timely implementation of an appropriate response, lower the costs borne by the U.S. and its regional partners alike, and prevent the burden from being placed solely on the U.S.

The Commission recommends development of a realistic financing strategy and mechanisms to trigger allocation of funds. Even with planning and leadership, an effective emergency response can fail if the operational agencies have insufficient resources and authorities to carry out their responsibilities. The Immigration and Nationality Act established an emergency fund that can be tapped in these situations. The development and inclusion of a realistic financing plan and trigger mechanisms for the disbursement of those funds are crucial to increasing the viability of any mass immigration response plan. Otherwise, the uncertainty regarding funding availability, division of costs, and reimbursements will continue to impede effective emergency responses. Such a process would facilitate agency participation in an emergency response and in advance planning and will likely facilitate and enhance the response effort itself.

The Commission also recommends that those particular agencies mandated to take operational responsibility for responding to a mass migration emergency are granted the necessary statutory authority to allow them to respond effectively. For instance, while INS currently has on-the-ground operational responsibility when migrants enter the U.S. under emergency circumstances, it lacks the authority to assign tasks to other agencies as needed. State and local governments are often confused about their authority to respond during a migration emergency. During a natural disaster, the Federal Emergency Management Agency does have statutory authority to "task" other federal agencies for additional support in its efforts to respond to the emergency and also has immediate access to funding to reimburse their

implementing partners. To further coordination and effectiveness, officials involved in the migration emergency planning process have begun to gather additional information from the relevant agencies about how they would respond to certain situations and what resources and authorities they would need to be able to do so.

ASYLUM

As a matter of legal obligation, humanitarian principles, and good public policy, the United States should not expel or return refugees to countries in which they have a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion. The United States fulfills this commitment through two statutory vehicles: Section 208 of the INA discretionary grants of asylum to individuals who have been persecuted in the past or who have a well-founded fear of persecution; and Section 241(b)(3) mandatory withholding of removal of those demonstrating that their life or freedom would be threatened if removed to a particular country (or Section 243(h) withholding of deportation for applications filed before April 1, 1997). Asylees may become permanent residents in the United States, but those granted withholding of removal cannot adjust status and may be deported to another country.

As a matter of legal obligation, humanitarian principles, and good public policy, the United States should not expel or return refugees to countries in which they have a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion.

Although the United States is not legally obliged to admit asylees for permanent settlement, we should and do provide such refuge on the basis of humanitarian principles and good public policy. We are legally obliged to have in place procedures for determining refugee status before taking any steps that may result in a person's return to a country in which he or she may face a threat to life or liberty. This obligation extends to refugees within the United States and at our frontiers. Asylum and withholding of removal procedures should ensure protection to *bona fide* refugees but also deter fraud and abuse of those procedures from unmeritorious claimants.

The Commission commends the regulatory changes in the asylum system that have professionalized and streamlined decisionmaking while reducing abusive claims to refugee status. The Department of Justice promulgated regulations in 1990 and 1995 that have greatly improved the process for adjudicating claims to asylum in the United States. The establishment in 1990 of a trained corps of asylum officers has raised the quality of decisions on asylum. The various administrative changes adopted in 1995, including the delinking of asylum claims and work authorization and the more efficient and consistent decisionmaking at the INS and Immigration Courts through procedural changes accompanied by the addition of more staff, appear to have reduced significantly the number of frivolous asylum applications without jeopardizing the integrity of the system.

Asylum interview
[Photo: INS Houston asylum office]

The Commission recommends enhanced attention to the timely removal of rejected asylum seekers. The absence of an effective and coordinated strategy to ensure the timely removal of rejected asylum seekers may undermine efforts to demonstrate that the U.S. is serious in its commitment to a credible asylum system. The Commission believes that priority regarding removal of asylum seekers should be given to those whose applications have been rejected under the new asylum system. The 1995 reforms sought to deter abuse by concentrating adjudicatory resources on new cases in order to send a message that asylum was no longer a route to indefinite stays in the United States. Only after INS and the Immigration Courts were able to make a decision on all new cases within six months did their attention turn to the large backlog of prereform asylum cases. This

strategy has, at least initially, reduced new asylum applications by half. The same logic holds for setting removal priorities. The U.S. should start now to remove the more recent applicants who fail to qualify for refugee status and who are ineligible for any other form of relief from removal. Once we carry out such removals on a regular basis, attention can then turn to deportation of individuals now in the asylum backlog who are ineligible for any relief.

The Commission expresses reservations about the asylum-related legislation enacted in 1996 and urges immediate correction of certain provisions that can harm bona fide asylum seekers and undermine the efficiency of the asylum system. In particular, the Commission is concerned about the following provisions:

- **"Credible Fear" Determinations in Expedited Removal Proceedings.** The 1996 legislation mandates expedited removal of individuals who are inadmissible because of certain forms of fraud, misrepresentation or faulty documentation.[2] Under the expedited removal procedures, individuals who request asylum must demonstrate that they have a credible fear of persecution in order to continue with their asylum application. The law anticipates that the "credible fear" determination will be made swiftly and requires that the Immigration Judge review of that determination be completed in no more than one week.

  The "credible fear" provisions were introduced in response to what appeared to be abuse of the asylum system at airports of entry by individuals who used fraudulent documents or destroyed the documents they had used to board flights to the United States. During 1995 and 1996, however, significant steps, such as sustained detention of such

[2] In its final report, the Commission will examine the application of expedited procedures to circumstances beyond those related to asylum or mass migration.

asylum seekers, were taken to control this abuse of the asylum process. In FY 1996, about 3,600 individuals requested asylum at ports of entry. This number of applications can be handled through the normal removal proceedings that provide greater protection to asylum-seekers. A separate port of entry process for hearing the preliminary credible fear applications is not merited for such cases.

The Commission believes that constitutionally-sound expedited procedures may be needed in exceptional circumstances. If the number of asylum applications increases significantly within a short period, the Attorney General could be given standby authority to institute "credible fear" determinations to sort legitimate asylum applications from those that are manifestly unfounded. During mass migration emergencies, a "credible fear" process certainly is preferable to the policy of direct return of all asylum seekers that has characterized past U.S. actions.

- **Detention of Asylum Seekers.** The new legislation specifies that even those applicants who meet the "credible fear" standard shall be detained until their full asylum hearing before an Immigration Judge. Detaining asylum seekers who have met an initial threshold demonstrating their likelihood of obtaining asylum is not a good use of scarce detention resources. As expressed above, the Commission does not believe "credible fear" is—except under exceptional circumstances—an appropriate standard for determining who will gain access to an asylum hearing. It is an appropriate standard for determining who will be released from detention. "Credible fear" already is used in the Asylum Pre-Screening Officer [APSO] Program.

  Asylum seekers whose claims meet the "credible fear" of persecution standard are not likely to abscond during their

removal proceeding as, were they to abscond, they would forfeit their reasonable chance to win asylum. Thus, they are releasable, subject to public safety, reasonable assurance of reappearance, and reasonable supervision during the interim. If the applicant's claim for asylum is rejected later at the full hearing on the merits, the applicant can be detained for deportation at that time.

Detainees at Krome Detention Center in Miami [AP/Wide World Photos]

By contrast, those do not meet the "credible fear" standard are subject to confinement pending their full hearing and cannot be released unless they obtain asylum. This immediate detention may deter future abuse of the asylum system and will facilitate the deportation of rejected asylum seekers.

The Commission recognizes that asylum seekers may create impacts for certain local communities. However, we believe release based on a "credible fear" determination serves the national interest. It permits the government to use its scarce detention resources on only those aliens who are likely to abscond or be a danger to the community.

- **Bars to Asylum and Withholding of Removal on Basis of Criminal Activity.** Aliens can be barred from applying or receiving asylum and withholding because they have committed particularly serious crimes. Prior to the Immigration Act of 1990 [IMMACT], determinations of whether a crime was "particularly serious" were based on a case-by-case analysis of relevant facts. Under IMMACT, Congress effectively made aliens convicted of an aggravated felony ineligible for asylum and withholding of removal. The Antiterrorism and Effective Death Penalty Act [AEDPA] created a

waiver of that bar with respect to withholding applications. IIRAIRA eliminated that waiver and significantly expanded the crimes that constitute an "aggravated felony." Thus aliens are now effectively barred from asylum if they have been convicted of any aggravated felony and from withholding of removal if sentenced to five years of imprisonment for such a conviction.

The Commission is concerned that the current categorical approach denying eligibility in a prescriptive manner may result in the return of refugees who are not dangers to the community and have not committed crimes that most Americans would consider to be particularly serious ones. In some cases, there would be broad agreement as to the seriousness of a crime that is currently included in the "aggravated felony" category (e.g., rape, murder, armed robbery, drug trafficking, etc.) Under IIRAIRA, however, an aggravated felony includes offenses for which a term of imprisonment of one year or more is imposed, regardless if that sentence were suspended or the actual time served by the alien was less. Such convictions may stem from participation in a minor brawl, shoplifting, or writing a bad check. Moreover, for those convicted abroad, the legislation does not make a distinction between those who truly committed serious crimes and those jailed by a repressive regime on trumped-up charges to silence their opposition. Further, the law does not take into account the different criminal standards used in different countries.

The process of determining whether an asylum claimant convicted of a crime should be denied asylum or returned should be both individualized and expeditious. In each case, and in a timely manner, the severity of the persecution feared should be balanced against the nature of the particu-

lar crime committed and the danger the individual may pose to the community. In short, the Commission believes that, given the consequences to the refugee and the U.S. community, there should be flexibility in weighing some of the crimes currently defined as "particularly serious."

- **Numerical Limitations on Asylum Grants.** The new legislation, for the first time, limits the number of grants of asylum that can be made in a given year to a particular category of refugees. Such artificial numerical limits on grants of asylum to recognized refugees are inadvisable. It is a violation of our laws and obligations to return recognized refugees to conditions that we have defined as persecutory merely because asylum numbers are unavailable. The alternatives—to place otherwise eligible asylees into the limbo state of withholding of removal or establish a backlog for approved cases who are awaiting an asylum number—undermine the credibility and efficiency of our asylum system.

Artificial numerical limits on grants of asylum to recognized refugees are inadvisable.

*The Commission recommends that asylees be admitted as Legal Permanent Residents [LPRs] upon the grant of asylum.** Currently, a grant of asylum is for an initial period of one year, after which, unless country conditions have changed or an asylee has availed himself or herself of the protection of another country, the asylee can adjust status to that of legal permanent resident. Part of the criteria for adjustment under Section 209(b) of the INA is that an applicant for such adjustment must still be a refugee and, therefore, requires a personal interview and nominal readjudication of asylum status. With respect to eligibility for naturalization, an asylee's record of admission begins one year before the date of the approval of the adjustment application.

* Commissioner Ezell believes that asylees should be granted a two-year conditional LPR status.

Elimination of the delay in adjustment would greatly reduce continued uncertainty and instability in the lives of asylees even after their initial approval and would enable asylees and their families to integrate into the U.S. in a timely fashion. These asylees already have passed through an extensive process for determining their refugee *bona fides*. It would also reduce the administrative burden placed on the INS, which already is overwhelmed with too many responsibilities.

The INA, as amended by the Immigration Act of 1990, also specifies that no more than 10,000 asylees may adjust to permanent legal resident status each year. In FY 1996, 10,000 asylees adjusted to permanent resident status, up from 7,800 in FY 1995 and 6,000 in FY 1994. More than 18,000 cases were granted asylum in FY 1996 (combined INS and EOIR figure), each case representing one or more individuals, in addition to the 6,500 Kurdish refugees resettled through the asylum process in that fiscal year. The Commission is seriously concerned that under the current system these developments will result in an unnecessary backlog of adjustment applications. We strongly reiterate our belief, stressed in our 1995 report on legal immigration, that the federal government should not manage immigration policy by backlogs and waiting lists. Given the recent reforms in the asylum system and the rigorous standard applied in granting asylum, numerical ceilings on adjustment are neither required nor good public policy.

However, we recognize that there are legitimate concerns as to the total number of refugees admitted, including asylees. The number of asylees who are expected to obtain permanent resident status, barring unforeseen changes in the pattern of asylum applications, should be considered during the annual consultation on refugee admissions. The Refugee Act of 1980 already requires the President to report on the number of asylees who adjust each year. This

requirement permits the President and Congress to assess the total commitment the United States is making, via the combination of our asylum and overseas resettlement program, towards protecting and assisting refugees.

U.S. REFUGEE ADMISSIONS FROM OVERSEAS

The United States has long been the principal country of resettlement for refugees from overseas. In just the past two decades, the United States has resettled almost two million refugees from such diverse countries as Vietnam, Laos, Cambodia, the former Soviet Union, Bosnia, Iran, Iraq, Afghanistan, Liberia, Ethiopia, Somalia, and Cuba. While resettlement is but one element of a comprehensive approach, and only a small proportion of refugees can be considered for admission to the United States, resettlement remains a powerful instrument through which the United States exercises leadership to find solutions to refugee crises. It is also a manifestation of one of our strongest traditions: to be a refuge to the world's persecuted.

Resettlement remains a powerful instrument through which the United States exercises leadership to find solutions to refugee crises. It is also a manifestation of one of our strongest traditions: America as a refuge to the world's persecuted.

The Commission strongly recommends that the U.S. continue its commitment to resettle refugees as one of several elements of humanitarian protection for the persecuted. Continuing a refugee admission program of significant numbers is essential: to sustain our humanitarian commitment to provide refuge to the persecuted; to pursue U.S. foreign policy interests in promoting human rights; and to encourage international efforts to resettle persons requiring rescue or durable solutions. A well-run refugee resettlement program that brings Americans into contact with refugees also can build support domestically for refugee protection and for the international efforts and agencies engaged in assistance and protection to refugees worldwide.

The Commission recommends that U.S. resettlement policy should rest on the following principles and frameworks:

- **Protection as a Core Priority**. The U.S. should give priority to those who are in imminent danger within their own countries or countries of first asylum**.**

- **Obligations to Per- sons Persecuted Be-cause of Close Association with the U.S. Government.** The U.S. has a moral obligation to accept for resettlement per-sons who are persecuted or who have a well-founded fear of persecution specifically because of their former employment by or significant assistance to the U.S. government or by agencies acting on behalf of the U.S. government, unless these individuals pose a security threat to this country or were themselves guilty of persecuting others.

- **Promotion of Human Rights and Democratization**. Selective resettlement of political dissidents and other victims of serious human rights violations can be an important component of U.S. foreign policy, highlighting the human rights abuses practiced by other countries and, thereby, supporting efforts to encourage other countries to respect fundamental human rights and democratic principles.

Rescue of Vietnamese Boat People
*[*UNHCR Photo: P. Deloche*]*

- **U.S. Leadership in Promoting Durable Solutions.** Resettlement in the U.S. should be undertaken in the context of interna-

tional efforts to find durable solutions for refugees. Many of the world's refugees cannot return to their country of origin and cannot remain permanently in their country of asylum. U.S. pledges of resettlement can help encourage other nations to do their fair share.

- **Consideration of the Effects of Resettlement Decisions on the Protection and Assistance of Refugees Worldwide.** Admission to the U.S. should be undertaken in close collaboration with UNHCR and other receiving countries.

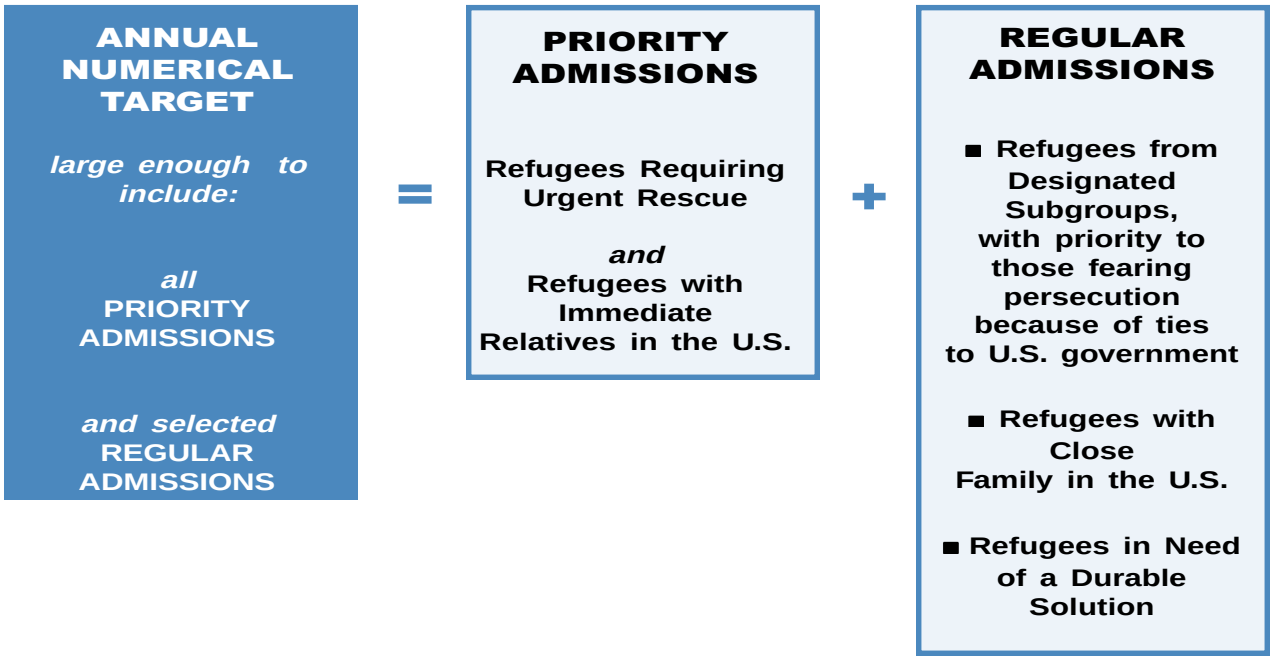
- **Proportionality of Support for Resettlement.** The U.S. should review carefully the proportionality of resources expended on resettlement relative to those required to assist, protect, and find solutions for refugees worldwide and to resolve refugee-producing situations.

- **Flexibility in Policy and in Program Implementation**. Refugee crises are difficult to predict with any degree of precision, making it imperative that the U.S. refugee program maximize its flexibility and minimize its response time.

- **Coordination and Consultation with Affected Agencies**. Refugee admission decisions have domestic and foreign policy ramifications, necessitating consultation and coordination with a wide range of private agencies, state and local governments, other nations, and international organizations.

The Commission recommends that the Bureau for Population, Refugees and Migration, which is charged with determining which refugees are of special concern to the U.S. for resettlement purposes, establish categories based firmly on human rights and humanitarian considerations and allocate admissions numbers according to these categories. Fiscal Year 1997 processing guidelines specify five "priorities" for considering refugees to be of special concern to the United States. The first priority

Chart 9.
Proposed Refugee Admissions Categories



category encompasses refugees who need resettlement for protection purposes, followed by designated groups of special concern to the U.S. and by family members of individuals with permanent legal status in the U.S. In practice, however, admission numbers are not now allocated by these so-called priorities. Instead, numerical limits are set by geographic region, with suballocations for specific nationalities within these regions. The Commission believes a prioritization and an allocation of numbers based on human rights and humanitarian considerations would reflect more accurately the reasons certain refugees are of special concern to the United States. Such a categorization can be accomplished administratively with no statutory changes.

An allocation and prioritization of refugee admissions based on human rights and humanitarian considerations would reflect more accurately the reasons certain refugees are of special concern to the United States.

The Commission suggests dividing categories for refugee admission into two broad priorities, each with subgroups, and with numbers allocated accordingly [**Chart 9**].

The first priority encompasses refugees whose immediate entry is justified. It has two subgroups: refugees who are in urgent need of rescue and refugees who are the immediate relatives of persons already living legally in the United States. The Commission believes sufficient admission numbers should be allocated each year to guarantee entry to all such *bona fide* applicants within this grouping.

The second priority includes refugees whose admission is of special humanitarian interest to the United States but who are not in imminent danger where they currently reside: refugees who are members of designated groups who have a well-founded fear of persecution because of their past association with the U.S. government or whose admission will support U.S. foreign policy interests in promoting human rights; refugees with family ties to permanent residents of the U.S., but who are not immediate relatives; and refugees in need of durable solutions who can neither repatriate nor remain indefinitely in their country of asylum. This second group should be allocated numbers on a spill-down basis [that is, the annual target

for refugee admissions minus the numbers needed for Group One], with the recognition that these refugees may remain in relative safety where they are until an admission number is available. Numbers should be allocated separately to the three categories within the second grouping, with a mechanism to move unused numbers between the categories. More specifically, the categorization would work as follows:

Priority One:

- **Refugees Who Are in Immediate Need of Rescue.** Protection of refugees is at the heart of the refugee regime. The Commission believes the United States should continue to give highest priority to the admission of refugees who face individual endangerment, cannot find protection where they are located or in another country, and for whom third-country resettlement in the U.S. is both a practical and realistic solution. Within this category are refugees who are in need of legal protection from *refoulement (or forced return)*, certain refugee women at risk of rape or other violence who cannot be protected where they are, victims of torture, and selected refugees who are in urgent need of continuing medical or other treatment not available in their country of first asylum. Also included in this category are refugees still within their country of origin who require immediate rescue from life- or liberty-threatening circumstances.

- **Refugees Who Are Immediate Relatives (spouses, minor children, and parents).** Imme-diate family members of U.S. citizens, legal permanent residents, previously admitted refugees, asylees and certain parolees admitted for long-term residence should have high priority for admission, regardless of nationality. The current system for admission of refugees with family ties in the U.S. is fraught with inconsistencies and discriminatory practices. Refugees from some

nationalities (Liberians, Sudanese, Burundians, Iraqis, and Iranians) have access to reunification with spouses, unmarried sons and daughters, and parents. Others (Bosnian Muslims who applied through March 1997) have access to reunification with more distant relatives, such as aunts and uncles, who are not dependent on the principal applicant. Other nationalities have no recourse to family reunification other than through regular immigration channels or in the limited circumstances where a spouse or minor is "following-to-join" a previously-admitted refugee or asylee. A worldwide standard for admission of immediate relatives would be more equitable.

A Vietnamese family reunited in America
*[*ORR Photo: Mark Halevi*]*

Priority Two (each to be assigned a target admission number):

- **Refugee Members from Designated Subgroups.** This category includes refugees who have a well-founded fear of persecution because of their past association with the U.S. government and refugees whose admission will support U.S. foreign policy interests in promoting human rights. For example, the United States has long given priority to the admission of Vietnamese who spent years in reeducation camps because they had worked for the U.S. government. In designating Burmese political dissidents as a group eligible for resettlement, the U.S. reinforces our opposition to the repression practiced in Burma [Myanmar]. Similarly, the United States has designated religious minorities experiencing past or present persecution in the former Soviet Union and Iran for admission. Designated groups from

Bosnia now include: refugees detained on account of their ethnicity, political opinion, or religion; victims of torture or systemic and significant acts of violence against members of targeted ethnic groups; and persons in mixed marriages. Should the persons eligible under this category exceed our targeted admissions level, family or other close ties to the United States could be considered in giving priority for admission.

- **Refugees with Close Family Ties in the United States**. This category permits the resettlement of a specified number of refugees who have close family ties in the United States but do not fit one of the other categories. The United States should take responsibility for resettling "our own," and we should expect other nations to do likewise. The difference in circumstances between refugees and immigrants justifies a separate category for family-based refugee admissions. Unlike would-be immigrants, refugees with family ties in the United States may be in precarious, even if not life-threatening, situations and be unable to wait where they are for approval of an immigrant petition. Further, many refugees have suffered significant loss of family members during the very situations that made them refugees; more extended family members may be the only surviving relatives of refugees already living in the U.S. These family members can provide essential practical and psychological support. Admission numbers would be allocated on a worldwide basis using a careful assessment of affidavits of relationship filed by U.S. family members on behalf of refugees overseas.

- **Refugees in Need of Durable Solutions in Accordance with Principles of International Responsibility Sharing.** A pressing aim of the international refugee system is to find durable solutions to refugee crises. It is in neither our national

interest nor that of other countries to see refugees remaining in camps permanently. For most refugees, repatriation is the best and most likely solution, but there are refugees who are unlikely to be able to repatriate and whose status in the place of asylum does not present realistic prospects for a satisfactory long-term solution. This category encourages the United States to work with other nations and UNHCR to provide admission to that minority of refugees for whom refugee resettlement presents the best likelihood for a durable solution. A specified number of admission slots would be allocated to this category each year in accordance with projections of resettlement needs and negotiations with other countries about responsibility-sharing for this resettlement. Should the need for durable solutions exceed our targeted admissions level, family or other ties to the United States could be considered in giving priority for admission under this category.

The Commission recommends that admissions under each category include family members and close household occupants who are dependent on the principal applicant for financial or physical security. Refugee admissions should provide the opportunity for family and other close household members who are dependent on the principal applicant for their financial support and/or physical security to enter with or quickly follow-to-join the principal applicant. Examples of individuals who might not qualify under a narrow interpretation of family include foster children, grandparents, grandchildren, and unmarried adult sisters and aunts. If not permitted to resettle with the rest of the household, the dependent person may be left in a particularly vulnerable situation, alone in what may be a hostile environment. It makes no sense for our own resettlement program to *create* refugees in urgent need of protection. However, in implementing this provision, adequate safeguards must be in place to prevent fraud or abuse by individuals who are not, in fact, dependent on the principal applicant.

The Commission reaffirms its recommendation that the United States set numerical targets—but not a statutory limit—for future refugee admissions. The Commission is opposed to establishing a statutory level of admissions that can be exceeded only by special legislation. Such a provision could impede U.S. flexibility to respond to humanitarian emergencies requiring higher admissions. The Commission remains concerned, however, that resettlement could drop to unacceptably low levels as the need for the two principal resettlement efforts of the 1980s and early 1990s—for refugees from Southeast Asia and the former Soviet Union—declines. Hence, we believe that to preclude a steady erosion of admissions, it is necessary to establish a minimum target or goal for post-Cold War refugee admissions.[3]

The Commission recommends that the consultation process be strengthened to ensure more effective Congressional participation in the setting of admission priorities and levels. As the Commission noted in its 1995 report to Congress, the annual consultations are at present often *pro forma* and occur far too late in the planning process to be effective. The following reforms would permit more timely and knowledgeable assessment of the need for resettlement and the resources required to admit and assist those admitted. They also would permit a more meaningful participation by Congress in the decisionmaking on refugee admissions.

- **Annual consultations on refugee admissions should consider not only admission levels and priorities for the coming year but also discuss projected need for resettlement**

[3] The Commission's 1995 report, *Legal Immigration: Setting Priorities*, contains additional discussion of numerical targets.

and appropriations for the following two years. The annual consultations should provide the opportunity not only for substantive discussions on admission targets but also on the level of appropriation required to pay the costs of the projected resettlement. These consultations should involve both the Judiciary and Appropriations committees. Consultations that address refugee resettlement projections in the out-years would foster the development of realistic targets for future refugee admissions. Such out-year projections are already used in developing the President's budget request for the Bureau for Population, Refugees and Migration and the Office of Refugee Resettlement. The recommended consultation process will permit greater consistency between admissions numbers and appropriation of resources by ensuring that admission and funding proposals are thoroughly vetted.

- **The consultation process should provide an opportunity for public hearings that involve a wide range of expert views on refugee admissions**. The Consultation process has two steps. The Administration first develops its proposal and Congress then assesses its adequacy. Both phases require more consultation with experts on refugee resettlement needs and capacities and with state and local officials. By law, Cabinet-level representatives must participate in the formal consultations between the Executive Branch and Congress, a requirement that often makes it difficult to schedule hearings but does not necessarily invite a thorough examination of the implications and impact of the resettlement decisions. While the Administration often consults with the private resettlement agencies and state governments assisting refugees, the consultations with Congress seldom involve these other players. Nor is input solicited by either the Administration or Congress from the wider range of human rights and humanitarian organizations that have first-

hand knowledge of the conditions precipitating the need for resettlement. Involving other experts and affected government agencies in the assessment of refugee admission priorities and numbers would provide a deeper under-standing of the domestic and international ramifications of the President's proposal.

The Commission recommends that the United States use an active, inclusive process for identifying and making decisions regarding the admissibility of applicants for resettlement. At present, resettlement on the basis of compelling security concerns and durable solutions requires that refugees be referred by the UNHCR or identified by a U.S. embassy. The Commission believes the U.S. government should confer with a broader set of agencies in identifying possible candidates for resettlement, including international and local human rights organizations, relief agencies providing assistance to refugees, and host governments. Department of State Refugee Coordinators now have broad authority to decide whether to accept a referral from UNHCR and would continue to exercise this authority in relationship to referrals from other sources. The Refugee Coordinators would also continue to consult with headquarters in Washington where appropriate.

The Commission cautions against excessive reliance on in-country processing of refugees for admission to the United States. In recent years, in-country processing has become the norm in U.S. refugee admissions from overseas. Indeed, about 80 percent of all resettlement to this country comes through in-country processing programs. Processing applications for admission while refugees are still within their own countries of origin can be a useful tool through which the U.S. can rescue individuals facing persecution without requiring them to make what may be a dangerous journey to a country of asylum. In-country processing is also an appropriate vehicle for resettling victims of past persecution whom the U.S. wishes to bring to this

country rather than leave where once they experienced torture, imprisonment, or other human rights violations.

However, in-country processing also presents a number of concerns that argue for judicious use of such programs. The availability of in-country processing has been used as a reason to deny asylum seekers access to first asylum protection within the United States. In-country programs can place refugee applicants in danger because processing generally takes place in public locations known to the persecuting authorities. When backlogs and waiting lists develop, even already-approved applicants may remain in danger until they are granted permission to travel to the United States. Alternately, as a recent report from the Department of State Inspector General points out, in-country processing gives countries that produce refugees (Vietnam, for example) substantial control over the U.S. resettlement program because these governments determine whether specific applicants will be given permission to present themselves for processing.

The Commission affirms the need for flexible and streamlined determinations of eligibility for the U.S. admissions program. Current procedures are too cumbersome to permit a timely response to precisely the type of refugee emergency that most requires resettlement. The most recent example is the 1996 decision to parole U.S.-employed Kurds into Guam. Had they been accorded refugee status as a group prior to evacuation, they would have been eligible for resettlement as refugees.

- **Streamlining of administrative processes** would allow quicker adjudication when short notice precludes current procedures or when there is need to evacuate a refugee who is in imminent danger. The Executive Branch should review the roles and responsibilities of the Department of State Refugee Coordinators, the Joint Voluntary Agency, the INS,

and the physicians conducting medical screening to identify areas where, in urgent cases, the process might properly be simplified or conducted within the United States after entry.

- **Training and career development paths for U.S. officials involved in the refugee admission program,** including Department of State Refugee Coordinators and INS examinations staff, should be reviewed and revised to reflect the nature of their responsibilities. Refugee Coordinators often arrive at their base with only minimal training to prepare them to respond to the demands of the refugee situations they monitor. Serving in this capacity is not seen as a valuable career path for these Foreign Service Officers who rotate through the assignment. The more active nature of the position contemplated by the Commission requires career development reforms within the Department of State to attract more experienced candidates.

  INS officers making refugee determinations overseas have not necessarily received the type of extensive training now available to INS staff making these same determinations for asylum applicants within the United States. All INS officers assigned to interview candidates for admission as refugees should receive the training provided to asylum officers and, to the extent possible, be drawn from experienced members of the asylum corps.

Current procedures are too cumbersome to permit a timely response to just the type of refugee emergency that most requires resettlement.

- **Narrowly-defined group profiles** for adjudicating certain refugee applications of humani-tarian concern to the U.S. would facilitate processing when the government has made a predetermination that it is because of their membership in the specified group that the refugees have a well-founded fear of persecution. Unlike asylum, where the applicant is self-selected, resettlement applies only to persons that the U.S. has decided to process. Using narrowly-designated groups makes particular sense when the U.S. is offering a

durable solution to refugees whom we determine are members of a group that cannot return to or remain within their home countries. An example would be the several thousand Kurds who worked for the U.S. government and U.S.-supported agencies in northern Iraq. The current interview that seeks to determine why each principal applicant left home is unnecessary when a group is defined in such highly specific terms and objective criteria indicate that members of that group would have a well-founded fear of persecution if required to remain in or return to their home country. Instead, the INS interview should be limited to determining if the applicant is indeed a member of the designated group.

Resettlement processing of Benadir in Kenya [Photo: CIR staff]

The Commission recommends that refugees be admitted as Legal Permanent Residents [LPRs] unless the Attorney General determines that there has been inadequate opportunity prior to admission for the INS officer to thoroughly review the case(s). Refugees are admitted now as conditional entrants and are required to appear before INS one year after entry for adjustment of status to permanent resident. The provision is an unnecessary burden on both INS and the refugee when applied to individuals who undergo a thorough screening prior to entry. In some instances, however, such as where refugees are hastily evacuated, the Attorney General could require adjustment of status up to one year later. This option protects against fraudulent entries when proper prescreening is not possible, while eliminating unnecessary bureaucratic procedures for the government and the individuals.

Chart 10.

TRANSITIONAL REFUGEE ASSISTANCE AND SERVICES

A cornerstone of refugee policy is the exemption of refugees from the provisions of immigration law that otherwise bar admission of individuals who are likely to become public charges. Failing to exempt refugees from exclusion on public charge grounds can have extremely serious consequences—as the U.S. learned when German Jewish refugees who were refused admission to the U.S. on these grounds perished in the Holocaust. As discussed in greater detail below, the Commission supports a domestic assistance program that helps refugees, admitted despite the possibility that they may become public charges, to achieve economic self-sufficiency after entry while providing full federal financial support for refugees who because of age or disability are unable to support themselves.

The Commission endorses a domestic refugee resettlement program of assistance and services whose aim is the social and civic integration into local communities of all refugees, as well as economic self-sufficiency of those refugees who are employable. Most refugees arrive without the financial resources, language skills, knowledge of the U.S. workplace, or occupational skills that would permit a smooth and quick adjustment to a productive new life. Moreover, refugees may have experienced torture, prolonged malnutrition, and other barriers to their immediate adaptation to life in the United States without some period of special assistance. Consequently, the Refugee Act authorized a special refugee assistance program for which funding is appropriated annually. This program is administered by the Bureau for Population, Migration and Refugees [PRM] in the Department of State and the Office of Refugee Resettlement [ORR] in the Department of Health and Human Services.

The following elements are both significant to the historical successes of the domestic resettlement program and important to preserve to the maximum extent possible:

A domestic assistance program should help refugees achieve economic self-sufficiency after entry as well as provide full federal financial support for refugees who because of age or disability are unable to support themselves.

- **A flexible national capacity** that can respond quickly to changing needs and circumstances, with structural capacity to expand and contract in response to the international refugee-producing events that inevitably will create significant increases and decreases;

- **Local flexibility and diversity** in resettlement programs that can accommodate differences in state and local resources, local labor market conditions, local agency capacity, and available complementary community services;

- **Specialized services** to orient and assist refugees in adjusting to their new country, preparing for employment, finding jobs, and maintaining employment;

- **Public/private-sector partnerships** that draw on the strengths of both;

- **A structure that promotes private giving and enlists community volunteers**;

- **Participation** of the many local, state, and national agencies that have a history of contributing in the resettlement of refugees;

- **A placement policy** that seeks to ameliorate local impact and facilitate effective resettlement;

- **Local accountability** for economic, social, and civic integration outcomes; and

- **Federal responsibility** for the costs of the domestic resettlement program.

[c]Estimates by David North.
[d]Does not reflect educational costs.

The Commission supports the current array of assistance and services for newly arriving refugees and recommends increased attention to services that prepare refugees for naturalization. The Commission believes the following array of assistance and services should characterize the refugee resettlement program:

- **Reception and placement into local communities** with a focus on initial basic maintenance assistance (food, clothing, shelter), orientation, and referral to services;

- **Health screening** to identify and follow up on certain communicable diseases;

- **Transitional cash assistance** for needy newly arriving refugees who do not qualify for the Supplemental Security Income [SSI] or Temporary Assistance for Needy Families [TANF] public assistance programs;

- **Transitional medical bene-fits** for needy newly arriving refugees who do not qualify for Medicaid;

- **Refugee-specific social services and educational services** (i.e., services specifically designed to serve refugees), such as employment, English as a Second Language [ESL], orientation, case manage-ment, and mental health counseling.

- **Naturalization preparation,** including outreach, civics education, and assistance in applying for citizenship.

The Commission supports the continuation of a public/private partnership to help refugees quickly and effectively achieve economic self-sufficiency, but recommends a more explicit division of responsibility than currently exists. Simultaneously, the Commission urges the federal, state and local agencies to develop a national plan for streamlining the program. The Commission heard extensive discussion of the problems inherent in

the current partnerships among federal, state, and local public and private agencies. Chief among these concerns were the complexity of the funding process and reporting requirements, the overlap of programs and responsibilities, the inappropriateness of welfare programs as the vehicle for providing assistance, and the lack of clear accountability for the outcomes of the program.

In an ideal world the Commission would urge that all refugees, except those eligible for SSI, be assisted through a separate, specially designed refugee cash assistance program linked to a system of services targeted to their circumstances. In practice, however, the obstacles to this are considerable. Such a program would require the combined resources of the existing ORR program plus those spent under TANF for refugees. However, the TANF budget is a fixed block grant to states, and hence its resources could not easily be diverted to a separate refugee program. Given the zero-sum federal budget process, it is unlikely that sufficient new funds would be allocated to ORR to cover the costs of a program for all refugees.

English language instruction and orientation [Photo: Mark Halevi]

Moreover, the advantages of maintaining the involvement of both the private and public sectors in resettlement may outweigh the disadvantages of some fragmentation in program delivery. Where resettlement has been effective, all partners have contributed positively and their participation has sustained broad public support for the admission of refugees. At the same time, however, the Commission urges the existing partner agencies to develop a plan to streamline funding and reporting.

The Commission also urges increased planning and coordination in the local resettlement of refugees and the decisions regarding the placement of refugees in local communities. Too often, localities reported to the Commission that they are given insufficient advance notice to prepare for the arrival of refugees. In particular, the Commission was disturbed by reports from local schools of inadequate—or no—information on anticipated arrivals of refugee children with special needs. The Commission recommends that PRM and the voluntary agencies develop improved procedures of notification to local schools about the forthcoming arrival of refugee children and to all relevant state and local agencies about the arrival of families. This will be particularly important under the Commission's recommendation of shared public and private sector responsibility.

The Commission further recommends a three-year trial period during which roles and responsibilities would be defined and divided as follows:

- **Reception and Placement [R&P] grants from the Department of State to the private voluntary agencies would continue to cover all arriving refugees**. At present, R&P grants cover a period of up to 120 days of diminishing responsibilities. The Commission proposes that R&P activities be limited to prearrival and reception and maintenance during the first thirty days only, to reduce currently overlapping responsibilities between R&P and the ORR-funded programs.

- **Health screening grants, administered by public health agencies, would continue to cover all arriving refugees**. The health screening could be funded through a *per capita* grant to states.

- **The private sector subsequently would be funded by ORR to assume principal responsibility for refugees who are**

not eligible for TANF or SSI. Under the Commission's proposal, the voluntary agencies would provide cash and medical assistance and services to those refugees who were ineligible for TANF or SSI. Cash and medical assistance would be provided for up to a specified time period [a maximum of eight months assistance is permitted under current policy]. Consideration should be given to providing medical assistance through private health care programs, rather than through Medicaid. The voluntary agencies would be charged with implementing an integrated program of assistance and services and would receive a proportionate share of appropri-ations for social services, cash and medical assistance, and administration.

- **The public sector would have principal responsibility for refugees who qualify for TANF, SSI, and Medicaid.** Cash and medical assistance would be provided to them through these programs and would be funded by the federal and state funds that support these programs. In addition, states would receive an allocation of funds appropriated for refugee social services proportional to the number of refugees enrolled in the TANF and SSI programs. States also would receive the funds appropriated for targeted assistance to provide longer-term and supplemental services to refugees or to offset state costs. States would have the option to subcontract or grant any or all of these functions and funds to private resettlement agencies.

The Commission believes that the recommended public/private partnership should continue for a three-year trial period during which its effectiveness would be evaluated to assess whether it should be continued or modified. This trial period will provide time to determine if the new TANF welfare program, which is designed to help its clients rapidly achieve economic self-sufficiency, is responsive to

the needs of refugees. It also will test whether the private agencies have the capacity to administer effectively a comprehensive program of services and cash and medical assistance in many different sites across the country.

Medical care

The Commission recommends strengthening the mechanisms by which the refugee program is funded. The current financing system does not provide sufficient clarity about the resources available for resettlement. The recommended statutory changes are intended to facilitate management of appropriations for the program and responses to emergency situations. The Refugee Act should be changed to:

- **Specify a minimum time period of special refugee cash and medical assistance provided to refugees not eligible for TANF or SSI.** Under current law, refugees may receive cash and medical assistance for up to thirty-six months. In practice, the actual period of eligibility—now eight months—is determined by budget rather than need for such assistance. A legislated minimum period of eligibility would preclude such budget-driven program policy.

- **Permit the appropriation of "no year" money for the cash and medical assistance portion of the ORR budget,** thus allowing automatic rollover of funds for these costs and providing the flexibility in budgeting and administration needed for such an unpredictable program.

- **Change the consultation process to ensure greater consistency between admission decisions and appropriation of funds to support refugee assistance and services.** As discussed under refugee admissions, the Commission favors an inclusive consultation on the administration's proposal for the upcoming fiscal year, as well as on two additional out-year projections of admissions.

- **Establish a domestic emergency fund** to pay for unanticipated costs associated with admission of refugees under the emergency consultation process or, if needed, to cover the minimum cash or medical assistance costs when they exceed the amount available for these purposes in a specific fiscal year**.**

The Commission recommends that under the leadership of the National Security Council, existing federal agencies develop an operating plan for improved national coordination. Better coordination is needed among the federal agencies and between the federal agencies and other public and private agencies to: (1) ensure consistency between admission decisions and transitional assistance requirements; (2) monitor and assess the adequacy of statutory and regulatory authorities to resettle refugees and develop a legislative agenda to make needed corrections; (3) improve local notification and preparation for arrivals, and (4) manage responses when emergency consultations are needed. The Commission believes that the National Security Council is the appropriate venue for this function.

The Commission recommends that Congress make urgently needed corrections in the Personal Responsibility and Work Opportunity Reconciliation Act of 1996. In its 1994 and 1995 reports to Congress, the Commission recommended against categorical denial of eligibility for public benefits to lawfully-resident immigrants and refugees. We continue to believe that such bars to eligibility are inconsistent with U.S. national interests and that the safety net provided by needs-tested

programs should continue to be available to those whom we have affirmatively accepted as legal permanent residents. With regard to refugees, two of the Act's provisions pose particular problems:

- **Inappropriate Time Limits on Eligibility of Elderly and Disabled Refugees for SSI and Other Federal Needs-based Programs.** Congress permitted refugees to retain eligibility for public benefit programs during their first five years in the country. Thereafter, refugees cannot obtain public assistance unless they naturalize. Thus, a refugee eligible for SSI and food stamps on arrival at age seventy will lose them at age seventy-five. Because it can take up to a year to naturalize, such aged and disabled refugees will suffer a disruptive break in coverage. Also, many elderly and some disabled persons will have great difficulty passing the naturalization requirements. Refugees are not subject to public charge grounds for exclusion and many do not have family sponsors to provide support. Providing continuing coverage under SSI, food stamps, and other means-tested federal benefit programs to elderly and disabled refugees would strengthen the U.S. capacity to offer resettlement to some of the world's most vulnerable refugees—the aged and disabled.

Elderly Bosnian refugee
[UNHCR Photo: A. Hollmann]

- **Inappropriate Eligibility Provisions for TANF-eligible Refugees.** At present, refugees are eligible for TANF only during their first five years in the United States and lose subsequent eligibility unless they naturalize. We believe that a small modification that would treat refugees as the law treats citizens—giving them a lifetime eligibility of five years—would make more sense. Pro-

gram experience shows that refugees are most likely to become self-sufficient if they enter the labor force within their first year in the United States. The existing provision may have the unintended effect of encouraging refugees to delay entry into the labor force, which would be detrimental to their likelihood of success. The proposed change is equitable and corrects a potential disincentive to employment.

CONCLUSION

Leadership is the theme of this report. Through the example of our own policies as well as leadership in international *fora*, the United States should work towards adoption of more effective policies to avert, respond to, and resolve refugee and related humanitarian crises. The Commission hopes these recommendations will serve as a blue-print for this renewed U.S. leadership.

Through the example of our own policies as well as leadership in international fora, the United States should work towards adoption of more effective policies to avert, respond to, and resolve refugee and related humanitarian crises.

REPORT TO
CONGRESS

Becoming an American:
Immigration & Immigrant Policy

SEPTEMBER 1997

U.S. COMMISSION ON IMMIGRATION REFORM

The Commissioners and staff
dedicate this final report
of the bipartisan
Commission on Immigration Reform
to the memory of

Barbara Jordan

Chair, U.S. Commission on Immigration Reform
December 14, 1993—January 17, 1996

"We are a nation of immigrants, dedicated to the rule of law. That is our history—and it is our challenge to ourselves. . . .It is literally a matter of who we are as a nation and who we become as a people. E Pluribus Unum. Out of many, one. One people. The American people."

(Barbara Jordan, August 1995)

September 30, 1997

The Honorable Newt Gingrich, Speaker of the House of Representatives
The Honorable Richard Gephardt, Minority Leader of the House of Representatives
The Honorable Trent Lott, Majority Leader of the Senate
The Honorable Tom Daschle, Minority Leader of the Senate

On behalf of the U.S. Commission on Immigration Reform, it is my pleasure to submit our Final Report, *Becoming an American: Immigration and Immigrant Policy*.

As mandated by the Immigration Act of 1990 [Public Law 101-649], this bipartisan Commission has examined and made recommendations regarding the implementation and impact of U.S. immigration policy. In fulfilling our mission, the Commission has held more than forty public hearings, consultations, site visits and expert discussions throughout the United States and in certain key foreign countries.

This report underscores the need for credible, coherent immigrant and immigration policy. Admission to this nation is only the first step of a process by which an immigrant becomes an American. Through the process of Americanization, immigrants become part of our communities and our communities learn from and adapt to their presence. We set out recommendations for immigrant policies that enhance this process through orientation services for immigrants and their new communities, English and civics education, and a credible, efficient naturalization process.

We also recommend immigration reforms. Since the Commission issued its 1994 report on illegal migration, significant progress has been made in improving border management, increasing criminal alien removals, reforming the asylum process, responding to mass migration emergencies, and pilot testing new worksite verification procedures. Illegal migration remains a problem, however, necessitating continued deterrence and removal efforts. In addition, we reiterate our call for legal immigration reform and make new recommendations regarding limited duration admissions.

In addition, we urge Congress to reconsider the welfare reform legislation adopted in 1996 that makes legal immigrants ineligible for basic safety net programs. Requiring immigrants to become citizens in order to receive the protections afforded by these programs debases citizenship. Further, making citizenship rather than legal status the determinant of eligibility blurs the distinction between legal immigrants, whom we welcome, and illegal aliens.

Restoring the credibility of our immigration system cannot happen unless the federal government is structured and managed effectively. While the Executive Branch has taken significant steps to address many of the weaknesses in current operations, the organization of the immigration system undermines reform efforts. Hence, in this report, we recommend a fundamental restructuring and streamlining of responsibilities for immigration.

Our work benefitted greatly from the effective cooperation we received from the Executive Branch and both Houses of Congress. We also thank the dozens of researchers who have contributed the results of their scholarship and the hundreds of community leaders, government officials, service providers and other experts who participated in our public hearings and consultations.

I particularly thank my fellow Commissioners. We have struggled with many tough issues, and we have reached consensus on nearly all of our recommendations. Without the dedication, hard work, and good humor of the members of this Commission, we could not have achieved this agreement. The work of the Commission could not have been accomplished without the support of an extraordinary staff led by Susan Martin, Executive Director and Andrew Schoenholtz, Deputy Director, assisted by the members of the Policy Research, the Public Affairs, Editorial, and Administrative Staffs. Each staff member has worked tirelessly to provide the Commission with volumes of valuable information, policy memoranda, and logistical support. The Commission is also indebted to the Executive Branch for lending outstanding career persons to serve on the Commission's staff.

Sincerely,

Shirley M. Hufstedler

U.S. COMMISSION ON IMMIGRATION REFORM

INTRODUCTION

Immigration and immigrant policy is about immigrants, their families and the rest of us. It is about the meaning of American nationality and the foundation of national unity. It is about uniting persons from all over the world in a common civic culture.

The process of becoming an American is most simply called "Americanization," which must always be a two-way street. All Americans, not just immigrants, should understand the importance of our shared civic culture to our national community. This final report of the U.S. Commission on Immigration Reform makes recommendations to further the goals of Americanization by setting out *immigrant* policies to help orient immigrants and their new communities, to improve educational programs that help immigrants and their children learn English and civics, and to reinforce the integrity of the naturalization process through which immigrants become U.S. citizens.

This report also makes recommendations regarding *immigration* policy. It reiterates and updates the conclusions we reached in three interim reports—on unlawful migration, legal immigration, and refugee and asylum policy—and makes additional recommendations for reforming immigration policies. Further, in this report, the Commission recommends ways to improve the structure and management of the federal agencies responsible for achieving the goals of immigration policy. It is our hope that this final report *Becoming An American: Immigration and Immigrant Policy,* along with our three interim reports, constitutes a full response to the work assigned the Commission by Congress: to assess the national interest in immigration and report how it can best be achieved.

MANDATE AND METHODS

Public Law 101-649, the Immigration Act of 1990 [IMMACT], established this Commission to review and evaluate the impact of immigration policy. More specifically, the Commission must report on immigration's impact on: the need for labor and skills; employment and other aspects of the economy; social, demographic, and environmental conditions; and the foreign policy and national security interests of the United States. The Commission engaged in a wide variety of fact-finding activities to fulfill this mandate. Site visits were conducted throughout the United States. Commission members visited immigrant and refugee communities in California, Texas, Florida, New York, Massachusetts, Illinois, Arizona, Washington, Kansas, Virginia, Washington, DC, Puerto Rico and the Commonwealth of the Northern Mariana Islands. Some Commission and staff members also visited such major source countries as Mexico, the Dominican Republic, Cuba, Haiti, and the Philippines. To increase our understanding of international refugee policy issues, members and staff of the Commission visited Bosnia, Croatia, Germany, and Kenya, and consulted with Geneva-based officials from the U.N. High Commission for Refugees and the International Organization for Migration. We held more than forty public hearings, consultations with government and private sector officials, and expert roundtable discussions.

TODAY'S IMMIGRANTS

The effects of immigration are numerous, complex, and varied. Immigrants contribute in many ways to the United States: to its vibrant and diverse communities; to its lively and participatory democracy; to its vital intellectual and cultural life; to its renowned job-creating entrepreneurship and marketplaces; and to its family values and hard-work ethic. However, there are costs as well as benefits from today's immigration. Those workers most at risk in

our restructuring economy—low-skilled workers in production and service jobs—are those who directly compete with today's low-skilled immigrants. Further, immigration presents special challenges to certain states and local communities that disproportionately bear the fiscal and other costs of incorporating newcomers.

Characteristics of Immigrants

In FY 1996 (the last year for which data are available), more than 900,000 immigrants came to the United States from 206 nations, for a variety of reasons and with a diverse set of personal characteristics. Not surprisingly, the characteristics of immigrants from different sending countries vary, as do their effects on the U.S. There are also differences between immigrants admitted under different classes of admission. These differences generally reflect the statutory provisions that guide admissions. [See Appendix for description of IMMACT's more specific provisions and its effects.]

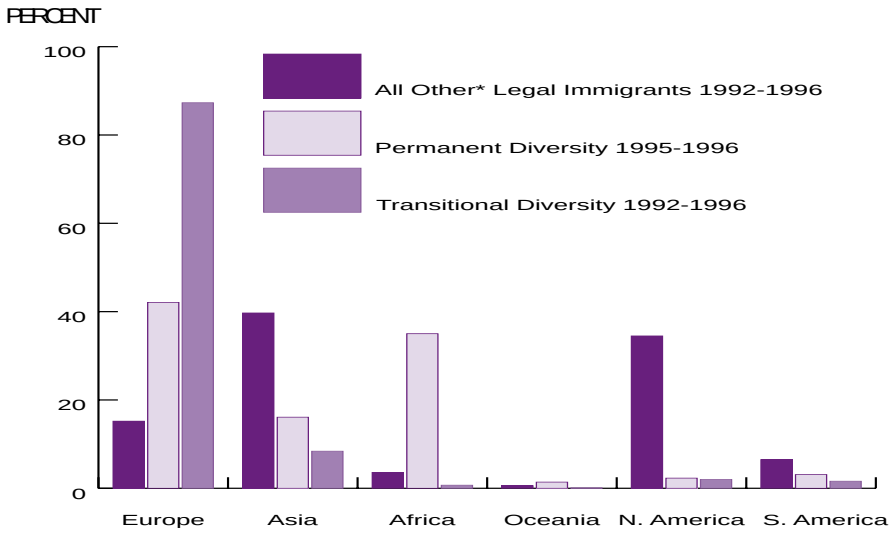
Places of Origin. Asia and North America (i.e., Mexico, Canada, the Caribbean, and Central America) remain the sending regions with the largest share of immigrants. Mexico remains the largest sending country and its share of total legal immigrants to the U.S. increased from an average of 12 percent in the 1980s to more than 13 percent in FY 1994 and up to 18 percent in FY 1996. The effects of the Immigration Reform and Control Act of 1986 [IRCA], which resulted in the legalization of about two million formerly illegal Mexican residents, explains this trend. Even though the special admission category for the spouses of legalized aliens' dependents has been discontinued, Mexico benefits from the IMMACT's removal of per- country limits on the numerically limited spouse and children class of admission (FB-2A).

IMMACT established a transitional and a permanent "diversity" category for countries whose admission numbers were adversely

affected by the Immigration Act of 1965. The transitional program was in effect from FY 1992 to 1994, but unused visas were carried over through FY 1996. The permanent program went into effect in FY 1995. European countries benefitted the most from the transitional program, which mandated that as many as 40 percent of the visas could go to nationals of Ireland. Actual Irish admissions reached only 35 percent, with Polish immigrants accounting for an even larger share (38 percent). Under the permanent diversity program, 42 percent of the immigrants came from European countries and 35 percent came from Africa. The effect on African admissions is particularly noteworthy as Africans account for less than 1 percent of immigrants in other admission categories.

Origins of Diversity Immigrants versus All Other* Immigrants



*Other includes immigrants in family, employment, and humanitarian-based categories of admission.

Intended U.S. Destinations. Immigrants in FY 1996 continue to select just a few states as their destinations. About two-thirds intend to reside in California, New York, Texas, Florida, and New Jersey. One-quarter of admissions are to California alone with another one-seventh to New York. New York City retains its place as the pre-eminent immigrant city with 15 percent of immigrants intending to go there. About 7 percent of immigrants intend to go to Los Angeles, and Miami and Chicago are in third place with about 4.5 percent each of the total. There has been little change in these leading destinations since IMMACT. However, some new destinations have emerged in recent years. For example, during the past decade, such midwestern and southern states as Mississippi, Nebraska, Kansas, Georgia and North Carolina saw more than a doubling of the number of immigrants intending to reside there. Although the numbers are significantly smaller than the more traditional destinations, absorbing more new immigrants can be a challenge for these newer destinations that often do not have the immigration-related infrastructure of the traditional receiving communities.

Age. Immigrants in FY 1996 remain young, with the largest proportion being in their later teens or twenties. A little more than one-fifth are children 15 years of age or younger, and another one-fifth are 45 years or older. More than one-half of family-based immigrants are younger than 30 years of age, reflecting the predominance of spouses and children. Because of beneficiaries, employment-based immigrants have just as many minor dependents age 15 years and younger as other groups, but more than two-fifths of these employment-based immigrants themselves are 30-44 years, the experienced and highly productive working ages. Diversity immigrants have a similar, yet somewhat younger, age distribution than other classes of admission. In contrast, and in large part due to those admitted as refugees from the former Soviet Union, humanitarian admissions tend to be somewhat older than other immigrants.

Age Groups of 1996 Legal Immigrants (Principals and Derivative Beneficiaries)

GROUP	ALL	FAMILY	EMPLOYMENT	DIVERSITY	HUMANITARIAN
15 yrs. & younger	22%	23%	20%	22%	20%
16 through 29 yrs.	31%	34%	23%	33%	27%
30 through 44 yrs.	27%	23%	44%	34%	24%
45 through 60 yrs.	15%	14%	12%	10%	21%
65 years & older	5%	5%	0%	1%	8%

Source: INS FY 1996 Public Use Admissions Data.

Gender. Females were 54 percent of admissions in FY 1996. There had been an essentially even balance of men and women during the decade of the 1980s. The increased share of females in the 1990s parallels the historical tendency toward more female immigrants throughout much of the post-World War II period. It also reflects the admission of the spouses of legalized aliens who were predominantly male. In FY 1996, family-based admissions were predominantly female (57 percent) and employment-based admissions (including beneficiaries) were evenly balanced by gender. Diversity (45 percent female) and humanitarian (48 percent female) admissions, in contrast, had more male immigrants. That a slight majority of FY 1996 humanitarian admissions were male is somewhat surprising given that worldwide refugee populations are disproportionately female.

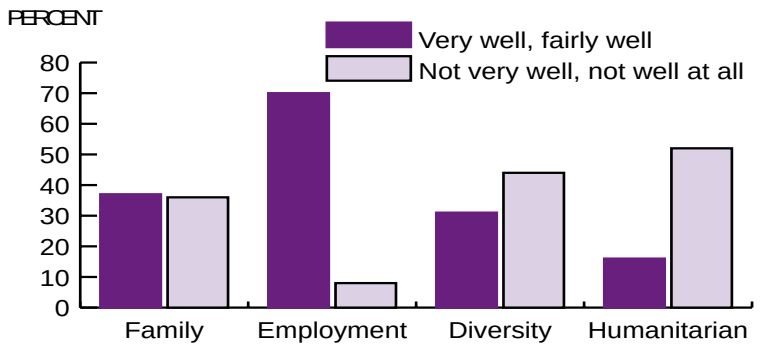
English ability. The Immigration and Naturalization Service [INS] admissions data do not include information on English language ability (or education, as discussed below). The following analysis draws instead on preliminary data from the New Immigrant Survey [NIS],[1] which studied a sample of immigrants admitted in FY 1996. The NIS is a pilot study designed to test the feasibility of a longi-

[1] Jasso, G.; Massey, D.S.; Rosenzweig, M.R.; Smith, J.P. 1997. The New Immigrant Survey [NIS] Pilot Study: Preliminary Results. Paper presented at the Joint Meeting of the Public Health Conference on Records and Statistics and the Data Users Conference, Washington, DC. (July.)

tudinal immigrant survey. Although the data are not yet published, analysis indicates that it offers promise of providing certain information about immigrants that has not previously been available.

The NIS, using the same measure as the U.S. Census, reports on the English language proficiency of adult legal immigrants who are 18 years and older. The initial results show that employment-based immigrants report the greatest English ability—70 percent of employment-based admissions report speaking at least fairly well and less than 10 percent speak very little or no English (the remainder report an "average" speaking ability). About 37 percent of family-based admissions report speaking English at least fairly well and an almost equal proportion report speaking little or no English. The diversity immigrants tend to report even less English ability, despite the requirement that they have at least a high school education. The humanitarian admissions trail the furthest behind in reported English language ability. Only 16 percent report speaking English at least fairly well, while more than 50 percent report speaking little or no English.

English Language Proficiency among New Adult Immigrants (18 years and older): 1996

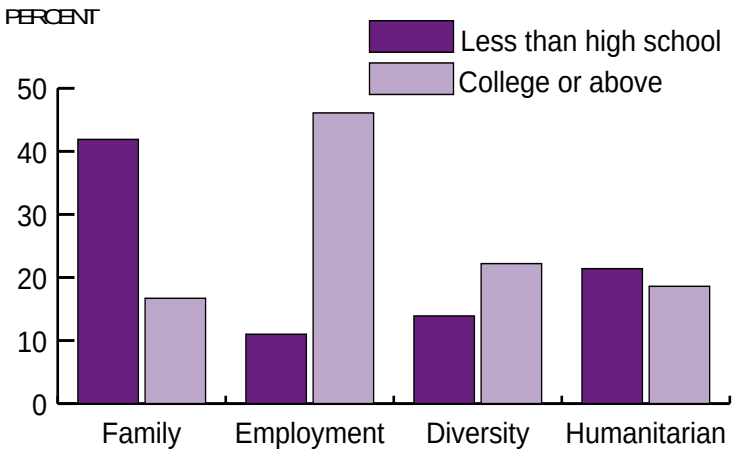


Source: Jasso, G.; et al. 1997. New Immigrant Survey Pilot Study.

Education. The years of schooling completed by immigrants is perhaps one of the most critical measures of skill level. The NIS provides our first indicators of years of education of adult legal immigrants at the time of their admission. As found in studies of foreign-born residents, the immigrants surveyed by the NIS tend to cluster at the higher or lower ends of the educational spectrum and differ significantly in their educational attainment by class of admission. Fully 46 percent of employment-based admissions have completed four years of college or a graduate degree. This figure includes principals and beneficiaries, making it likely that well-educated employment-based immigrants tend to have well-educated spouses. In contrast, just 17 percent of family-based immigrants 25 years and older have completed a college-level education while 42 percent have less than a high school education.

Diversity immigrants are required to have a high school education or two years of skilled work experience. The NIS data show that diversity immigrants tend to be better educated than family-based,

Educational Attainment of Legal Immigrants (25 years and older): 1996



Source: Jasso, G.; et al. 1997. New Immigrant Survey Pilot Study.

but not as well educated as employment-based immigrants. About 14 percent have not completed high school. They may be either principals who meet the work but not the education requirement or the spouses of the principals. Twenty-two percent of diversity immigrants have completed college or done graduate-level education, about the same proportion as among U.S. natives.[2]

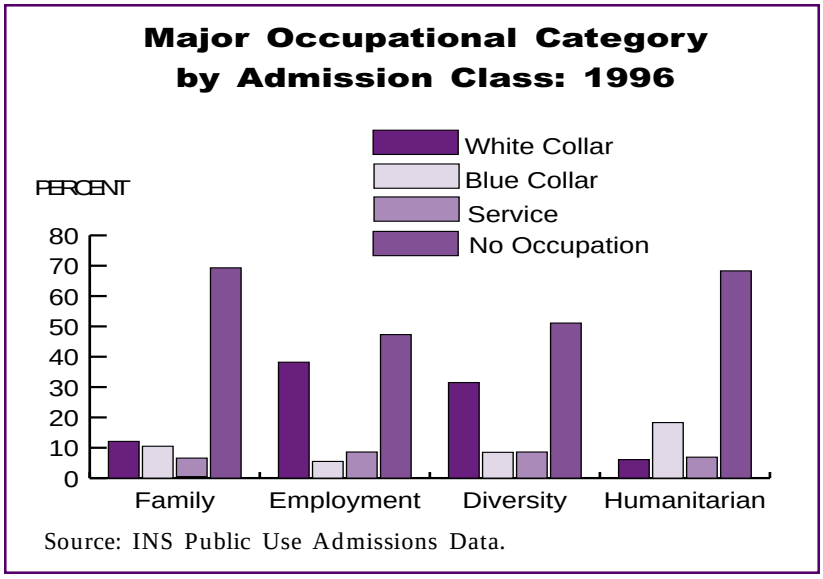
The humanitarian classes of admission are less well educated than the employment-based, but are better educated than family admissions. The large number of relatively well-educated persons admitted as refugees from the Soviet Union may partly explain this finding. About 21 percent have less than a high school education, while about 19 percent have college or higher degrees.

Occupation. Ultimately, the English and educational skills that immigrants have are reflected in their occupations. The INS admissions data, which we use here, have only crude occupational classifications. It imperfectly captures the difference between immigrants who adjust into legal permanent resident [LPR] status after working in a U.S. job for several years and those who report an occupation upon admission that tells us more about what the immigrant did at home than what they will do here.

Sixty-five percent of all immigrants in FY 1996 reported no occupation or being a "homemaker," reflecting the fact that children, parents, and spouses are a large share of all admissions and most do not work at the time of entry.

---

[2] The U.S. Current Population Survey [CPS] permits us to compare directly to the native-born, but the foreign-born data do not distinguish by admission status. The CPS data also include illegal aliens who have extremely low levels of education in the foreign-born category. See: Fix, M.; Passel, J.S. 1994. *Immigration and Immigrants: Setting the Record Straight*. Washington, DC: The Urban Institute. These figures for the diversity class of admission correspond to data on education collected by the U.S. Department of State for diversity immigrants only.



Source: INS Public Use Admissions Data.

Nevertheless, occupational status faithfully reflects the legal requirements of the admission class—the proportion of all immigrants not reporting an occupation is greater among family and humanitarian admissions, about 70 percent of all immigrants in each category. By way of comparison, only about one-half of all employment and diversity admissions have no reported occupation.[3] The skills which immigrants bring to the United States are reflected in their type of occupations. Family and humanitarian immigrants are primarily blue-collar workers. In contrast, employment-based and permanent diversity immigrants are predominantly white-collar workers. These broad differences between the major classes of admission have changed only slightly over the past three decades.

IMMACT has had an effect on occupational distribution within these broad categories. To gauge its effects, a research paper prepared for

[3] The initial results from the NIS pilot show that about 40 percent of adult nonexempt family immigrants are not employed. Alternatively, more than 95 percent of employment-based principals are employed. The INS admission figures for "no occupation" include children and persons who are unemployed, retired, or for whom no information is given.

FY 1996 Regular Admissions by Occupation: Predicted and Actual

OCCUPATION	PREDICTED (WITHOUT IMMACT)	ACTUAL (WITH IMMACT)	EXCESS OF ACTUAL OVER PREDICTED
WHITE-COLLAR WORKERS			
Professional, Technical, and Kindred			
Health Professionals	10,244	18.986	85%
Other Professionals	9,231	19,477	111%
Technical & Specialty	22,115	33,117	50%
Executives	20,283	30,702	51%
Sales	12,943	13,002	0%
Administrative Support	19,437	19,807	2%
BLUE-COLLAR WORKERS			
Precision Production	21,028	20,116	-4%
Operators, Fabricators, & Laborers	37,702	53,936	43%
FARMING, FORESTRY, AND FISHING	12,251	12,588	3%
SERVICE	48,180	51,797	8%
TOTAL WITH OCCUPATION	165,234	221,731	34%
TOTAL WITHOUT OCCUPATION	261,694	498,583	91%
GRAND TOTAL	426,928	730,314	69%

Note: Predicted numbers in FY 1996 are based on linear projections (from the years between 1972 and 1991), and are kept within numerical limits on nonexempt categories. Humanitarian admissions are not included.

Source: Greenwood, M.; Ziel, F.A. 1997. *The Impact of the Immigration Act of 1990 on U.S. Immigration*. Washington, DC: U.S. Commission on Immigration Reform.

the Commission calculated simple linear projections for all of the admission categories now subject to the worldwide ceiling on admissions. Data from FY 1972-1991 were analyzed and the trends identified, then projected forward to FY 1996. This analysis, therefore, paints a "what-if" picture of what today's immigration might have looked like if past trends had continued unaffected by IMMACT [see table above].

The actual total number of admissions under the worldwide ceiling in FY 1996 was 720,314 which—compared to the projected figure of

426,929—was 69 percent greater than would have been expected without IMMACT. Admissions were greater than the projected figure because IMMACT increased numerically-limited family, employment, and diversity admissions. The numerically-exempt admissions for the immediate relatives of U.S. citizens would have grown between 1992 and 1996 even without IMMACT. This analysis does not include humanitarian admissions.

Of immigrants who reported an occupation, the actual admissions in FY 1996 were 221,731 which—compared to the projected figure of 165,234—was 34 percent greater than would have been expected if IMMACT had not gone into effect. By contrast, nonworking immigrants experienced a 91 percent increase of actual over projected. This finding is not surprising as FY 1996 family admissions were significantly higher than would have been permissible under previous law. In part this was because IMMACT permitted unused FY 1995 employment-based numbers to be transferred to the FY 1996 family categories. In combination with a growth in immediate relatives (including those who would normally have been admitted in FY 1995 but were caught in processing delays), the additional visas meant more spouses and minor children entered. These immigrants are the least likely to be employed.

As might be anticipated, IMMACT's new emphasis on admitting highly-educated and skilled persons led to growth in professional occupations among those who reported an occupation. As stated above, there was an overall 34 percent increase in persons reporting an occupation. This increase was not evenly distributed, however. The number of health professionals, for example, was projected to be 10,244, but at 18,985 was 85 percent greater. The number of executives also shows a higher than expected increase. Interestingly, projections not shown here indicate that within the employment-based category, family members (beneficiaries) of the principals show the greatest growth in professional occupations. This suggests that when principals with more skills are admitted, they

bring with them spouses who are, likewise, more skilled than in the past. Further, projections not shown here indicate that the skill requirement for permanent diversity immigrants makes for more highly-skilled admissions from eligible countries. In short, IMMACT increased both the numbers of more skilled admissions and their share of immigrants admitted.

Most nonprofessional white-collar and blue-collar occupations show very little or no growth over what might have occurred without IMMACT. The one notable exception is a greater-than-expected increase in the number of "Operators, Fabricators, and Laborers." There were 53,936 admissions in these occupations compared to the 37,702 that were projected. As the employment-based access for persons with these occupations is highly limited, it appears that much of this increase is attributable to family-based admissions. It is unclear from the data, however, why this pattern has emerged.

Earnings. According to the NIS survey, the median earnings of all male immigrants admitted in 1996 was $15,600 and for women was $11,960, lower than the median earnings for natives. Compared to the earnings in their last country of residence, male immigrants experienced a 59 percent increase and women a 45 increase in earnings upon admission to the United States. Differences in earnings are, as should be expected, substantial by admission class. Many employment-based immigrants earn a median income of $36,400 on the date of their admission to LPR status, while the sibling or spouse of an LPR earns $11,750 and the spouse of a citizen earns $18,200.

Effects on the Economy

An independent evaluation of immigration by a panel of eminent social scientists at the National Research Council [NRC], sponsored by the Commission,[4] found that immigration has a positive economic impact on the national level. However, the NRC panel's findings confirm the by now commonplace conclusion that there are tangible costs to certain sectors of the labor market and certain communities. This reinforces the Commission's conclusions on the need for a well-regulated system of immigrant admissions, as well as the need for attention to means of improving integration and reducing friction between newcomers and established residents.

The NRC panel estimates that immigrants may add $1-10 billion directly to the national economy each year, a small but positive amount in a $7.6 trillion economy. Many consumers, business owners, and investors benefit from the immigrant labor force. Recent newcomers may be willing to work for lower wages than other U.S. workers, although, with the exception of many immigrants with less than a high school education, most immigrants tend to earn as much as natives after a decade. Many others in the economy benefit, particularly those who do work that is complementary to that performed by immigrants. Immigrants provide the labor that has kept viable entire segments of certain labor-intensive industries, such as garment and shoemaking. Many immigrant entrepreneurs expand trade with foreign countries from which they come, and the language and cultural expertise of many immigrant employees are valuable to U.S. companies doing business abroad.

Immigrants also contribute to the economic revitalization of the communities in which they live. As middle-class natives have left the

inner cities, immigrant newcomers have settled, established businesses, bought homes, and otherwise invested in these areas. Gateway cities, such as New York and Los Angeles, have benefitted particularly from this urban renewal. At the same time, these cities face new challenges related to immigration. Growing immigrant communities require local school systems (some of which may have otherwise faced declining enrollments) to provide sufficient classroom space and teachers. They must also develop programs to teach children who are without English skills or prior education. Overcrowded housing, drug trafficking, gang violence, sweatshops, and public health problems also may be found in many of these inner-city communities.[5]

Immigration particularly affects certain U.S. workers. The NRC panel finds that workers with less than twelve years of education are the most adversely affected by low-skilled immigrant workers. Immigrants may have reduced substantially the wages of high school dropouts, who are about one-tenth of the workforce, by 5 percent nationwide. This is a sizable impact on a group that was already poorly paid before the loss in real earnings it experienced over the past two decades. Most often it is the foreign-born worker, particularly in labor markets with large numbers of immigrants who experience the greatest competition.[6] While the education and skill level of most U.S. workers differs significantly from those of most immigrants (and therefore they are not competing for the same jobs), the new arrivals are often direct substitutes for immigrants who arrived a short time before them.[7]

The evidence on the impact of immigration on native-born minorities nationwide is less clear. The NRC concluded that in the aggregate, the economic opportunities of African Americans are not reduced by immigration because African Americans and immigrants tend to be in different labor markets and reside in different cities. Other research finds small, adverse effects on African Americans.[8] These effects are found most strongly when low-skilled minority workers compete with low-skilled immigrant workers in the same industries and the same geographic areas.

The fiscal effects of immigration also are complicated. Generally, the impacts on the federal government are favorable compared to those on state and local governments. Most studies show that at the federal level, the foreign-born pay more in taxes than they receive in services. When spread across all taxpayers, this characteristic represents a very small, but positive, benefit. At the local level, however, immigrants often represent a net fiscal cost, in some cases a substantial one. Research on the resident illegal alien population finds the clearest examples of fiscal costs to states and localities.[9] In general, much of the negative effect is related to school costs that are considerable because of the larger size of many immigrant families. Although funds spent on education may be considered an investment, not just a fiscal burden, the payoff is not realized for many years.

Clark, R.; Passel, J.S.; Zimmermann, W.N.; Fix, M.E. 1994. *Fiscal Impacts of Undocumented Aliens: Selected Estimates for Seven States.* Washington, DC: The Urban Institute Press.

Education affects fiscal impacts in a second way. Ultimately, the economic success and fiscal contributions of immigrants are determined by their educational level. The NRC panel found that immigrants who complete high school and beyond generally represent a more favorable balance of fiscal costs and contributions than do those with little or no education. Even over their lifetimes, immigrants without education are unlikely to contribute sufficient tax revenues to offset their use of services. Both groups of immigrants tend to use public services in a similar fashion, particularly as related to the schooling of their children, but the more educated immigrants tend to earn more and pay higher taxes.

Educational differences also explain why certain states and localities are more adversely affected by immigration than are others. California immigrants represent a sizeable tax burden (estimated at almost $1,200 per native-headed family per year) while New Jersey immigrants represent a more modest tax burden (estimated to be $232 per native-headed family per year). The difference can be explained largely by the differences in the average educational level of the immigrants residing in these states.[10]

English language ability also affects the economic success and fiscal impacts of immigrants. In the 1990 Census, 47 percent of the foreign-born more than 5 years of age reported not speaking English "very well." Individuals with poor English language skills tend to be confined to the lowest levels of the U.S. job market. By contrast, ability in spoken English markedly improves immigrants' earnings, especially for Hispanic and Asian adult immigrants.[11] English read-

ing comprehension also has been found to improve the earnings of young immigrant adults.[12]

Population Growth and Natural Resources

In recent years there have been about 800,000 legal admissions and an additional estimated 200,000 to 300,000 unauthorized entries, but the net annual increase of the foreign-born population is about 700,000 each year due to return migration and mortality.[13] In 1996, the foreign-born population was 24.6 million, 9.3 percent of the U.S. population. Recent arrivals make up a large share of the resident foreign-born population; about 28 percent arrived after 1990, and an additional 35 percent during the 1980s.

It is estimated that international migration makes up somewhere between one-quarter and one-third of net annual population increase. Given current demographic trends and noting that much can happen to alter long-range forecasts, the U.S. Census Bureau projects the population to increase by 50 percent between 1995 and 2050. Immigration is likely to become a larger proportion of the net increase.[14]

The NRC report also presented estimates of population growth. It found that *without* immigration since 1950, the U.S. population would have been 14 percent smaller than its 1995 size of 263 million. The NRC projected the population to the year 2050 after making certain assumptions about mortality, fertility, and rates of group inter-mar-

riage. According to the projection based on these assumptions, the U.S. population would increase by 124 million persons to 387 million, with immigration responsible for two-thirds (82 million) of the increase. Of this 82 million, 45 million are immigrants and an additional 37 million increase is due to their higher assumed fertility.

Immigration affects the age structure as well as the overall population. The NRC panel projected that under current immigration policy, kindergarten through grade eight school enrollment in 2050 would be 17 percent higher than it was in 1995. High school enrollment would rise from 14.0 million in 1995 to 20.3 million in 2050. Immigration also has small effects on the proportion of the population that is elderly. No matter which immigration policies are adopted, according to the NRC, the number of persons aged 65 years and older will double between 1995 and 2050. However, the proportion of older people in the total population will be somewhat smaller with immigration.

The NRC panel's projection of the ethnic distribution of the U.S. population in 2050 shows the Hispanic population increasing from 10 to 25 percent and the Asian population from 3 to 8 percent of the population. These projections are dependent on today's rates of group intermarriage and how persons report their ethnicity. It may be that, like children of immigrants who arrived in the last century, descendents of today's immigrants will choose to report their ethnicity as being different from that of their parents, and that today's ethnic categories will not accurately describe tomorrow's populations.

What broader implications do these growth figures have? Some analysts argue that high immigration levels mean an abundant supply of youthful workers who will be a substantial spur to the economy. From this perspective, population growth is an engine for technological progress and the means to solve environmental problems, effectively spawning change out of necessity. Proponents of

this view argue that human resourcefulness has dealt with population growth in the past and the solutions often have left us better off. Adding more people may "cause us more problems, but at the same time there will be more people to solve these problems."[15]

Others are concerned about the negative consequences of population growth, particularly on the environment, infrastructure, and services.[16] They see population growth as imposing pressures on our natural resources and quality of life, raising special concerns in the arid regions of the southwest or sites of industries relocating to the south central states.[17] Those concerned argue that our future well-being depends upon both conservation, and stabilizing population growth.[18]

This debate primarily concerns total U.S. population growth, which is strongly influenced by immigration. Still, there is little or no information about whether immigrants have *differential* impacts distinct from the population increase they produce on the U.S. environment.[19]

The Commission did find that rapid inflows of immigrants can pose difficulties for those who must plan for community growth. Schools sometimes receive large numbers of new immigrant students that had not been planned for. Housing and infrastructure development

may not be adequate in affected urban and rural communities.[20] New immigrant destinations, sometimes to areas that have not had new immigrants for a century or more, can put particular stress on communities that have experienced rapid growth in the past decade.

Foreign Policy and National Security Interests

Immigration matters frequently are intertwined with foreign policy and national security. Today, migration and refugee issues are matters of high international politics engaging the heads of state involved in defense, internal security, and external relations.[21] International migration intersects with foreign policy in two principal ways. The U.N. Security Council has acknowledged that migration can pose threats to international peace and security through economic or social instability or humanitarian disasters. Migration can also build positive relations with other countries and thereby promote national security. As a consequence, migration itself requires bilateral and international attention to help address the causes and consequences of movements of people.

During the Cold War, a foreign policy priority was the destabilizing of Communist regimes. Refugee policy was often a tool to achieve that strategic goal, for instance, by encouraging the flow of migrants from Eastern Europe or Cuba. Elsewhere, political, economic, and military involvement in Southeast Asia and the Dominican Republic had significant migration consequences, as large numbers of Southeast Asians and Dominicans ended up as refugees and immigrants

to the U.S. These foreign policy priorities generally have had significant immigration consequences years later.

Alternatively, immigration concerns sometimes have played a significant role in U.S. foreign policy, especially when mass movements to the U.S. are feared. A stated rationale for U.S. Central-American policy in the 1980s was to prevent a mass movement that would occur if anti-American Marxist dictatorships were established in Central America. One of the explicit reasons for the military intervention in Haiti in 1994 was to restrain the flow of migrants onto U.S. shores. And, although the U.S. does not officially maintain relations with Cuba, migration concerns gained priority over diplomatic ones leading to negotiations on the Cuban Migration Agreement and to a reversal of policy regarding the interdiction of Cuban migrants.

Some observers believe that environmental causes now rival economic and political instability as a major source of forced migration throughout the world. There are estimates that as many as one-hundred million people may be displaced, in part, because of degradation of land and natural resources. "That will increase the pressure to migrate to places like the United States."[22] The pervasive deterioration of Mexico's rural drylands may contribute to between 700,000 and 900,000 people a year leaving rural areas.[23] Environmental degradation in Mexico, Haiti, and Central America also are believed to have migration consequences for the U.S. Often environmental problems intersect with other causes. One researcher argues that migrants from Haiti may be considered "environmental refugees" because the root causes of their migrations are land deg-

radation and the Haitian government's unwillingness to act in the interest of the general population."[24]

Stabilizing economic growth and democracy may be an effective means of reducing migration pressures. The Commission for the Study of International Migration and Cooperative Economic Development[25] concluded that, over the long run of a generation or more, trade and investment are likely to reduce migration pressures. Supporters of the North American Free Trade Agreement [NAFTA] argued that NAFTA-related development eventually will reduce unauthorized Mexican migration. The U.S. has provided the reinstalled democratically-elected government of Haiti with a great deal of rehabilitation assistance that should aid the stability of that country.

CONCLUSION

Properly-regulated immigration and immigrant policy serves the national interest by ensuring the entry of those who will contribute most to our society and helping lawful newcomers adjust to life in the United States. It must give due consideration to shifting economic realities. A well-regulated system sets priorities for admission; facilitates nuclear family reunification; gives employers access to a global labor market while protecting U.S. workers; helps to generate jobs and economic growth; and fulfills our commitment to resettle refugees as one of several elements of humanitarian protection of the persecuted.

AMERICANIZATION AND INTEGRATION OF IMMIGRANTS

A DECLARATION OF PRINCIPLES AND VALUES

Immigration to the United States has created one of the world's most successful multiethnic nations. We believe these truths constitute the distinctive characteristics of American nationality:

- American unity depends upon a widely-held belief in the principles and values embodied in the American Constitution and their fulfillment in practice: equal protection and justice under the law; freedom of speech and religion; and representative government;

- Lawfully-admitted newcomers of any ancestral nationality—without regard to race, ethnicity, or religion—truly become Americans when they give allegiance to these principles and values;

- Ethnic and religious diversity based on personal freedom is compatible with national unity; and

- The nation is strengthened when those who live in it communicate effectively with each other in English, even as many persons retain or acquire the ability to communicate in other languages.

As long as we live by these principles and help newcomers to learn and practice them, we will continue to be a nation that benefits from substantial but well-regulated immigration. We must pay attention

to our core values, as we have tried to do in our recommendations throughout this report. Then, we will continue to realize the lofty goal of *E Pluribus Unum*.[1]

AMERICANIZATION

The Commission reiterates its call for the Americanization of new immigrants.

The Commission reiterates its call for the Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy and equal opportunity. The U.S. has fought for the principles of individual rights and equal protection under the law, notions that now apply to all our residents. We have long recognized that immigrants are entitled to the full protection of our Constitution and laws. The U.S. also has the sovereign right to impose appropriate obligations on immigrants.

In our 1995 report to Congress, the Commission called for a new commitment to Americanization. In a public speech that same year, Barbara Jordan, our late chair, noted: "That word earned a bad reputation when it was stolen by racists and xenophobes in the 1920s. But it is our word, and we are taking it back." Americanization is the process of integration by which immigrants become part of our communities and by which our communities and the nation learn from and adapt to their presence.

This process enhances our unity by focusing on what is important, through acknowledging that the many real differences among us as individuals do not alter our essential character as a nation.

---

[1] Our national motto, *E Pluribus Unum*, "from many, one," was originally conceived to denote the union of the thirteen states into one nation. Throughout our history, *E Pluribus Unum* also has come to mean the vital unity of our national community founded on individual freedom and the diversity that flows from it.

This Americanization process depends on a set of expectations that the United States, which chooses to invite legal immigrants, legitimately has of newcomers. It applies equally to the expectations immigrants legitimately have of their new home.

The Commission proposes that the principles of Americanization be made more explicit through the covenant between immigrant and citizens. These principles are not mere abstractions. They can form a covenant between ourselves and immigrant newcomers. As President Johnson eloquently stated in 1965:

> They came here—the exile and the stranger. . . . They made a covenant with this land. Conceived in justice, written in liberty, bound in union, it was meant one day to inspire the hopes of all mankind; and it binds us still. If we keep its terms, we shall flourish.

We have not always abided by its terms, but the ideal of a covenant between immigrant and nation still captures the essence of Americanization. Immigrants become part of us, and we grow and become the stronger for having embraced them. In this spirit, the Commission sees the covenant between immigrants and ourselves as:

> ***Voluntary***. Immigration to the United States—a benefit to both citizens and immigrants—is not an entitlement and Americanization cannot be forced. We as a nation choose to admit immigrants because we find lawful immigration serves our interests in many ways. Likewise, no one requires immigrants to come here or to become citizens; they choose to come and, if they naturalize, they choose to become a part of our polity.

Mutual and reciprocal. Immigration presents mutual obligations. Immigrants must accept the obligations we impose—to obey our laws, to pay taxes, to respect other cultures and ethnic groups. At the same time, citizens incur obligations to provide an environment in which newcomers can become fully participating members of our society. We must not exclude them from our community nor bar them from the polity after admission. This obligation to immigrants by no means excuses us from our obligations to our own disadvantaged populations. To the extent that immigration poses undue burdens on our communities, our citizenry, or immigrants themselves, we have an obligation to recognize and address them.

Thus the United States assumes an obligation to those it admits, as immigrants assume an obligation to this country they chose. Having affirmatively admitted the newcomer, the federal government necessarily extends civic and societal rights. Unfortunately recent legislative changes effectively have excluded immigrants from the public safety net until such time as they become naturalized citizens. This Commission previously recommended against such action. We believe it is likely that these changes will lead to greater problems both for immigrants and for the communities in which they live. Legislation that leads immigrants to seek citizenship to protect eligibility for social benefits, rather than out of commitment to our polity, provides the wrong incentive. The effect is not to exalt citizenship, but to diminish it.

Individual, not collective. The United States is a nation founded on the proposition that each individual is born with certain rights and that the purpose of government is to secure these rights. The United States admits immigrants as individuals (or individual members of families). As long as the United States continues to emphasize the rights of

individuals over those of groups, we need not fear that the diversity brought by immigration will lead to ethnic division or disunity. Of course, the right to assemble and join with others is a fundamental right of all Americans, immigrants included. However, unlike other countries, including those from which many immigrants come, rights in the United States are not defined by ethnicity, religion, or membership in any group; nor can immigrants be denied rights because they are members of a particular ethnic, religious, or political group.

The Commission believes that the federal government should take the lead and invite states and local governments and the private sector to join in promoting Americanization**.** For example, "I Am an American Day" was once widely celebrated in public schools and local communities. Recent immigration legislation mandates naturalization ceremonies on the 4th of July. While the federal government cannot and should not be the sole instrument of Americanization, it can provide important leadership in supporting the implementation of programs designed to promote full integration of newcomers.

To help achieve full integration of newcomers, the Commission calls upon federal, state, and local governments to provide renewed leadership and resources to a program to promote Americanization that requires:

- Developing capacities to orient both newcomers and receiving communities;

- Educating newcomers in English language skills and our core civic values; and

- Revisiting the meaning and conferral of citizenship to ensure the integrity of the naturalization process.

The Commission recommends that the federal government take an active role in helping newcomers become self-reliant: orienting immigrants and receiving communities about their mutual rights and responsibilities, providing information they need for successful integration, and encouraging the development of local capacities to mediate when divisions occur between groups.

ORIENTATION

The Commission recommends that the federal, state, and local governments take an active role in helping newcomers become self-reliant: orienting immigrants and receiving communities as to their mutual rights and responsibilities, providing information they need for successful integration, and encouraging the development of local capacities to mediate when divisions occur between groups. Information and orientation must be provided both to immigrants and to their receiving communities. The experience of "newcomer schools" is that providing coordinated information and advice on life in the United States accelerates the integration of newcomers, which, in turn, decreases the negative impacts on communities. Information on expected impacts and successful programs can help localities foster immigrant integration and mediate differences to avoid community conflicts.

More specifically, to integrate into American society, immigrants need information on their legal rights and obligations, on American core civic beliefs, on how to access services, and on immigration-related requirements. Communities require information on the numbers and characteristics of immigrants arriving in their midst, the eligibility of newcomers for various services, the legal responsibilities of state and local government agencies, and similar matters. The Commission believes the federal government should help immigrants and local communities by:

- **Giving orientation materials to legal immigrants upon admission** that include, but are not limited to: a welcoming greeting; a brief discussion of U.S. history, law, and principles of U.S. democracy; tools to help the immigrant locate and use services for which they are eligible; and other immigration-related information and documents. All immigrants would receive the same materials. The packets would

be available in English and the main immigrant languages. It is not the Commission's intent to prescribe all parts of an orientation packet but, rather, to suggest the most important information and key resources that should be included.

Welcoming statement. The Welcoming Statement would congratulate immigrants on their decision to become permanent residents of the United States. It also would summarize the basic principles that all Americans embrace.

Example of a Welcoming Statement

Congratulations on your decision to immigrate to the United States of America. Best wishes for a successful settlement in your new home. This is a proud country of individual freedom, opportunity, and diversity with a long tradition of immigration. Finding success and opportunity in the United States can be difficult. We realize that immigrants face many challenges as they become self-reliant, such as learning a new language and adjusting to new circumstances. The U.S. has learned from its tradition of immigration that patience, tolerance, and adaptability are required from each and every one of us.

Basic American principles that you are asked to embrace include: a commitment to serve the best interests of the United States and the community in which you live; knowledge of and respect for our laws and democratic institutions; respect for freedom of speech and religion; and a commitment not to discriminate against others on the basis of nationality, race, sex, or religion. The excerpts from the U.S. history and law section of your orientation packet should serve to illustrate the meaning of these important principles.

We the people of the United States welcome you.

Example of Documents on the Founding Principles

On July 4, 1776, the Continental Congress adopted a Declaration drafted by Thomas Jefferson that defined the commitment of a new nation to the principles of liberty and justice for all:

> *We hold these Truths to be self-evident, that all Men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are Life, Liberty, and the Pursuit of Happiness—That to secure these rights, Governments are instituted among Men, deriving their just Powers from the Consent of the Governed. . . .*

The greatest contradiction in the new nation's founding was the institution of human slavery, which ended only after a bloody civil war (1860-1864). After the decisive battle at Gettysburg, in 1863, Abraham Lincoln dedicated the cemetery, ending with these words:

> *[W]e here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.*

After the Civil War, the effort to live up to the promises of the founding principles intensified. In 1872, Susan B. Anthony was arrested for attempting to vote in a Presidential election. Her speech on the rights of women was an important step toward gaining women the vote:

> *The preamble of the federal Constitution says . . . It was we, the people; not we, the white male citizens; nor yet we, the male citizens; but we, the whole people, who formed the Union. And we formed it, not to give the blessings of liberty, but to secure them; not the half of ourselves and our posterity; but to the whole people —women as well as men.*

Way into the twentieth century, the founding principles continue to challenge Americans. In 1963, the Reverend Dr. Martin Luther King, Jr. led a peaceful March on Washington, and spoke on the steps of the Lincoln Memorial in the cause of civil rights.

> *When the architects of our republic wrote the magnificent words of the Constitution and the Declaration of Independence, they were signing a promissory note to which every American was to fall heir. This note was a promise that all men would be guaranteed the unalienable rights of life, liberty, and the pursuit of happiness . . .*
>
> *I have a dream that one day this nation will rise up and live out the true meaning of its creed: "We hold these truths to be self-evident; that all men are created equal. . . . I have a dream that my four little children will one day live in a nation where they will not be judged by the color of their skin but by the content of their character . . . And if America is to be a great nation this must become true.*

U.S. history, law, and principles of democracy. This would include a brief history of the United States and of the principles listed in the welcoming statement, followed by excerpts from relevant historical documents. It would stress that American civic culture is based on a trust in ordinary people's ability to govern themselves through their elected representatives who are then accountable to the people, on the right of all members of the polity to participate in public life as equals, and on the freedom of individual members of the community to differ from each other in religion and other private matters.

Tools for settlement. This section would emphasize the development of self-reliance. It would include general information and checklists to aid immigrants in finding and using services in their community that may help them in developing economic independence.

Example of Tools for Settlement

What to expect upon immigration: information to orient newcomers on federal policies and services, such as a pre-/ post-arrival checklist on admissions, information for those adjusting status on new rights and responsibilities as permanent residents, reminder to register for military service if necessary, the role of government agencies and service providers; consumer protection and tax policies;

How to secure basic needs: information on housing, employment, education and language training, health, transportation, police and fire protection, managing finances, and cultural adjustment;

Finding assistance and advice: telephone numbers for the local information clearinghouses, government agencies; documents listing weight and measurement conversions, U.S. holidays, instructions in using the telephone and postal systems; a U.S. map;

Getting involved in the community: listings of community organizations (e.g., civic, sports, arts) and volunteer opportunities.

Immigration information and documents. This section would provide necessary immigration forms, information on naturalization, and a card for non-English-speaking immigrants to indicate their need for an interpreter.

- **Encouraging state governments to establish information clearinghouses in major immigrant receiving communities.** The Commission recommends that the federal government provide modest incentive grants to states to encourage them to establish and maintain local resources that would provide information to immigrants and local communities. For example, local information clearinghouses could provide information to immigrants on rights and responsibilities, naturalization, education and training, and the world of work. They could have materials available on tenant law and renter/landlord rights and responsibilities. They could spell out how U.S. family law (regarding marriage and prohibiting spouse and child abuse, polygamy, and female genital mutilation, etc.) may differ from other cultures. They could provide information on public life (driving, insurance, hunting/fishing licences, law enforcement, consumer protection, etc.). They could also provide information to local public and private organizations about immigrants, e.g., documentation, culture/background, eligibility status for programs, work authorization verification.

  The resource centers could develop, translate and disseminate materials; foster partnerships among immigrant interest groups, ethnic churches, and service providers (advisory boards, taskforces, planning boards, coalitions); and develop volunteer networks in immigrant communities to help newly-arriving immigrants. These efforts could help reduce community tensions arising from immigration by providing accurate information and helping communities find ways to mediate these tensions. The resource centers could also

provide information on model programs implemented by businesses, service agencies, and others.

The Office of Refugee Resettlement in the Department of Health and Human Services, which already provides funding for refugee services, could administer this grant program. Each state receiving funds would designate the local structure through which the funding would be administered as part of its application for funds. Some states are likely to designate the state refugee coordinator's office, but others may designate the state education department. States had similar flexibility when they received funds under the State Legalization Impact Assistance Grant [SLIAG] program.

These already-existing structures could easily integrate the proposed services with only modest financial increments. Based on its consultations, the Commission believes that an annual appropriation of $30-35 million would cover development of orientation materials and underwrite services in forty to fifty targeted communities. The monies should be administered flexibly, not as a formula to each state. Targeted areas should include those with historically significant numbers of immigrants as well as communities experiencing a sudden growth in immigrant arrivals. (In Garden City, Kansas, for example, the Commission observed how the arrival of new meatpacking plants changed the population from one with few foreign-born residents a decade ago to one with a sizeable immigrant component today.)

- **Promoting public/private partnerships to orient and assist immigrants in adapting to life in the United States.** The Commission previously has called for a renewed public/private partnership in the Americanization of immigrants. While the federal government makes the decisions about how many and which immigrants will be admitted to the

United States, the actual process of integration takes place in local communities. Local government, schools, businesses, religious institutions, ethnic associations, and other groups play important roles in the Americanization process.

Project Vida in El Paso provides medical services to the Latino border community. Funded by the Presbyterian Church and public/private grants and contracts, Vida developed "one-stop shopping" for primary health care, education, housing, and other social services. It built 20 affordable rental units; and helped to generate an increase in local elementary school reading scores.

The Commission urges the federal government to assemble leaders from the public and private sectors at the federal, state, and local levels to discuss ways to invigorate a public/private partnership to promote Americanization. The participants should include representatives of state and local educational systems, businesses, labor, local governments, and community organizations. The meeting would address ways to enhance resources for instruction in English language acquisition, civic understanding, and workplace skills. The federal grant program described above also could help promote more coordinated efforts at the local level by establishing advisory structures representing the various public and private institutions with interest in immigration matters.

The Fannie Mae Foundation built a model public/private initiative with community-based organizations, public officials, and lenders to facilitate home ownership and naturalization for immigrants.

EDUCATION

Education is the principal tool of Americanization. Local educational institutions have the primary responsibility for educating immigrants. However, there is a federal role in promoting and funding English language acquisition and other academic programs for both immigrant children and adults.

The Commission urges a renewed commitment to the education of immigrant children. The number of school-aged children of immigrants is growing and expected to increase dramatically. These children, mostly young, speak more than 150 different languages; many have difficulty communicating in English. They are enrolled in public schools as well as in secular and religious private schools through the country.

In addition to the problems other students have, immigrant children face particular problems in gaining an education—often because of language difficulties. The 1990 Census shows that 87 percent of immigrant children attended high school as compared to 93 percent of natives. More than one-fourth of Mexican immigrant youth between ages 15 and 17 were not in school in 1990. While some dropped out, others never "dropped in" to school in the first place.

The Commission urges a renewed commitment to the education of immigrant children.

Immigrant children often come from countries with customs, traditions, and social and governmental structures that differ from those they encounter in the U.S.; some have little or no formal education and no understanding of the American school system; some arrive with personal experiences of trauma and war; many older children come from countries where school ends at a younger age; many experience lengthy delays in being mainstreamed into regular English-speaking classes; and some do not receive appropriate-level instruction in other academic subjects while they are learning English.

Immigrant children also bring strengths to American society. For example, their native-language skills contribute to building the future multilingual workforce needed in a global economy; sharing of their cultural heritage will promote the sensitivity of that workforce as it interacts in a worldwide marketplace. Many immigrant children who enroll in school and then remain to graduate do well academically. These immigrant children are more likely than natives to prepare for, attend, and complete college.[2] The key, however, is helping them achieve sufficient English proficiency to be able to participate.

The Commission emphasizes that rapid acquisition of English should be the paramount goal of any immigrant language instruction pro-

---

[2] Venez, G.; Abrahamse, A. 1996. *How Immigrants Fare in U.S. Education.* Santa Monica: RAND. Rumbaut, R.G.; Cornelius, W.A. 1995. *California's Immigrant Children: Theory, Research, and Implications for Educational Policy.* San Diego: Center for U.S. Mexican Studies.

gram. English is the most critical of basic skills for successful integration. English can be taught to children in many ways. Effective programs share certain common characteristics. Based on a review of these programs, the Commission emphasizes the need to*:*

The Commission emphasizes that rapid acquisition of English should be the paramount goal of any immigrant language instruction program.

- **Conduct regular evaluations of students' English competence and their ability to apply it to academic subjects.** Such evaluations will ensure placement of immigrant children into regular English-speaking classes as soon as they are prepared. Regular evaluation also will highlight strengths and weaknesses in educational programs and provide insight on improvements that are needed to ensure timely English acquisition.

- **Collect and analyze data regularly on students, their linguistic and academic performance, and the method of instruction.** Presently, federal, state, and local governments fail to collect and analyze adequate, uniform, data on bilingual and other forms of English instruction. Such failure hinders overall evaluation and the responsible allocation of government funds. A 1997 National Research Council report[3] pointed out the need for new systems to support data collection and research in this area. The NRC recommended establishment of a new Department of Education Advisory Committee on Research on English-Language Learners, urged the National Center for Education Statistics to take the lead in collecting data on students and programs, and recommended that the Office of Bilingual Education and Minority Language Affairs take the lead in developing and evaluating programs to enhance teacher development.

---

[3] National Research Council (August, D; Hakuta, K. eds.). 1997. *Improving Schooling for Language-Minority Children: A Research Agenda.* Washington, DC: National Academy Press.

- **Include appropriate grade-level instruction in other academic disciplines.** Coordination with teachers, curricula, and instruction outside of English acquisition will promote students' mastery of regular subject matter while they learn English.

- **Involve parents of immigrant students in their schooling.** A characteristic of many of the most successful language acquisition programs is the active involvement of parents in the education of their children. Such "family literacy" models include programs that promote frequent parent-teacher conferences and that also encourage non-English-speaking parents to enroll in English as a Second Language [ESL] programs. Some of the adult programs are offered at the local school in the evenings.

Seattle's Sharples Center teaches refugee students with limited or no English proficiency in grades six through twelve. They are grouped by English language ability, not age. Because of high demand, they usually can stay for only six months or less. The program focuses on preventing subsequent low academic perfor-mance and also pre-venting the high dropout rates that occur when students with limited English proficiency are mainstreamed too soon.

The Commission encourages programs that are responsive to the needs of immigrant children and an orientation to United States school systems and the community, such as we have seen in "newcomer schools." Newcomer schools must not isolate immigrant newcomers. Instead, they must be transitional and actively promote the timely integration of students into mainstream schools. Successful programs recognize the special needs of immigrant children, particularly refugees. They share information among resettlement programs and school administrators and among English acquisition and regular classroom teachers. Along with English and other academic subjects, newcomer schools teach basic school survival and living skills (such as how the local transportation system works and how to shop for food) and develop intercultural communications. Some also provide access to a wide range of support services, such as health screenings and immunizations.

The Commission encourages programs that are responsive to immigrant children's needs and an orientation to United States school systems and the community.

The Commission recommends the revival and emphasis on instruction of all kindergarten through grade twelve students in the common civic culture that is essential to citizenship. An understanding

of the history of the United States and the principles and practices of our government are essential for all students, immigrants and natives alike. Americanization requires a renewed emphasis on the common core of civic culture that unites individuals from many ethnic and racial groups. Civics instruction teaches students both the responsibilities and the rights of United States citizenship. Civics education also can help immigrant students turning eighteen to prepare for naturalization. The Commission recommends that local school boards institute civics programs that:

San Francisco's Newcomer High School was the nation's first high school devoted entirely to immigrants. Students with less than six years of education and/or poor English skills may attend for up to a year of intensive instruction based on their English ability rather than on their age. Before they are mainstreamed, students are taken to see their new school and meet their new teachers.

- Teach that the U.S. is united by the constitutional principles of individual rights and equal justice under the law;

- Restore the emphasis on such traditional American leaders as Washington, Jefferson, and Lincoln, who defined the American promise of liberty and equality for all, and incorporate other heroes and heroines, such as Sojourner Truth, Susan B. Anthony, Martin Luther King, Jr., Franklin Roosevelt, and Barbara Jordan, who expanded their promise to all Americans;

- Stress the importance of civic holidays and of American symbols and rituals, for example, the flag and the Pledge of Allegiance.

The Commission recommends the revival and emphasis on instruction of all kindergarten through grade twelve students in the common civic culture that is essential to citizenship.

Civics instruction in public schools should be rooted in the Declaration of Independence, the Constitution—particularly the Preamble, the Bill of Rights, and the Fourteenth Amendment. Emphasizing the ideals in these documents is in no way a distortion of U.S. history. Instruction in the history of the United States, as a unique engine of human liberty notwithstanding its faults, is an indispensable foundation for solid civics training for all Americans.

The Commission emphasizes the urgent need to recruit, train, and provide support to teachers who work with immigrant students.

There is a disturbing shortage of qualified teachers for children with limited English proficiency, of teacher training programs for producing such teachers, and of other support for effective English acquisition instruction. More than 50 percent of teachers in current bilingual education programs have no formal education in teaching students with limited English skills. Teachers are often unprepared and untrained in understanding how the cultural background and experiences of immigrant children may affect their ability to learn. They need to understand that while many students quickly acquire skill in using and understanding English in social situations, acquiring academic proficiency in English takes longer.

All teachers of immigrant students—those who teach English and those who teach other academic subjects—need training to develop the most effective tools for imparting knowledge to students with limited English proficiency. Teachers also need help in understanding how best to involve immigrant parents who may themselves be limited in their command of English. Schools that have been effective in involving immigrant parents in their children's education tend to be more effective in retaining and educating students. To promote such involvement, teachers must be sensitive to differences in language and culture that may impede an immigrant parent's ability to participate in school activities.

The Commission emphasizes the urgent need to recruit, train, and provide support to teachers who work with immigrant students.

The Commission supports immigrant education funding that is based on a more accurate assessment of the impact of immigration on school systems and that is adequate to alleviate these impacts. Urban and rural schools often require federal assistance when confronted with large numbers of immigrant students. Current federal support comes through several unrelated funding streams: some is geared to particular instructional models; some is directed to address impacts of large numbers of new arrivals; however, most comes indirectly through monies targeted to schools with economically disadvantaged children who are performing poorly.

The Commission supports immigrant education funding that is based on a more accurate assessment of the impact of immigration on school systems and that is adequate to alleviate these impacts.

Washington, DC's public Bell Multicultural High School offers secondary and adult day/evening intensive English classes, vocational programs, career development, dropout prevention, technical preparation, and comprehensive math and science. Bell students have high attendance rates, high advanced placement exam scores, and high rates of continuing on to higher education. Last year counselors assisted more than 30 students to become citizens. Many staff are both immigrant and multilingual and, thus, can both empathize with students' transitions and support Bell's strong native language-maintenance program.

There are costs and responsibilities for language acquisition and immigrant education programs that are not now being met. We urge the federal government to do its fair share in meeting this challenge. The long-run costs of failure in terms of dropouts and poorly-educated adults will be far larger for the nation and local communities than the costs of such programs.

More specifically, we urge the federal government to:

- **Provide flexibility in federal funding for the teaching of English to immigrant students to achieve maximum local choice of instructional model.** The federal government should not mandate any one mode of instruction (e.g., bilingual education, English as a Second Language programs, immersion). Research indicates that no one pedagogical model for English instruction works more effectively than any other. What makes for success are: the commitment of the local school system to educate its English learners; well-trained teachers who are adept at English language instruction; involvement of parents; frequent evaluation of student language acquisition; and a plan for timely placements in mainstream programs.

- **Make funding contingent on performance outcomes—that is, English language acquisition and mastery of regular academic subject matter by students served in these programs.** School systems receiving funds because of large numbers of children with limited English proficiency and immigrant children should be held to rigorous performance standards. Incentives should promote—not impede—expeditious placement in regular, English-speaking, classes.

The Commission urges the federal, state, and local governments and private institutions to enhance educational opportunities for adult

immigrants. Education for basic skills and literacy in English is the major vehicle that integrates adult immigrants into American society and participation in its civic activities. Literate adults are more likely to participate in the workforce and twice as likely to participate in our democracy. Literate adults foster literacy in their children, and parents' educational levels positively affect their children's academic performance.

The Carlos Rosario Adult and Career Center in Washington DC. was for 25 years the only DC public school teaching English to adult foreigners, graduating classes as large as 650 students. Closed due to funding constraints, it reopened with private funding in a church in Chinatown. Courses are offered in computer use, nursing assistance, and GED.

According to the 1990 Census, a total of 5.8 million adults reported that they speak English "not well" or "not at all." This number continues to grow because of the entry of non-English-speaking immigrants. Researchers estimate that 600,000 adults with only limited or no English now enter the United States each year. Immigrants who are illiterate even in their native language or who have only a few years of schooling consequently are confined to employment in dead-end jobs.

The Commission urges the federal, state and local governments and private institutions to enhance educational opportunities for adult immigrants.

Adult education is severely underfunded. Available resources are inadequate to meet the demand for adult immigrant education, particularly for English proficiency and job skills. Enrollment in adult English as a Second Language classes increased 183 percent from 1980 to 1990; neither classes nor funding have kept pace with demand. In Massachusetts, a state widely recognized for its excellent adult education programs, an estimated 11,000 of the 16,000 on the waiting list for adult basic education are waiting for ESL services.

Three principal problems impede the capacity to expand opportunities for adult education. First, funding to subsidize courses is limited. Many adult immigrants are willing and able to pay some tuition for courses, expecting a positive return on this investment. However, given average income levels of uneducated, unskilled immigrants, they are unlikely to be able to cover the total costs of adult education courses.

The Resources Occupational Training Program in Brooklyn, New York, a nonprofit adult vocational training program, operates as an affiliate of the Catholic Migration Office of the Diocese of Brook-lyn. Launched in 1994 with seed money from an Italian businessman, it trains and places 98 percent of its immigrant students in well-paying jobs without government assistance.

Second, teacher training programs are limited, resulting in shortages in the number of qualified teachers. For example, in Massachusetts, there are only two training programs for teachers of ESL to adults and no Masters-level program for teachers of adult basic education. Many schools utilize volunteers to serve as tutors, but there is an insufficient number of trained teachers to provide guidance to these volunteer aides.

The third impediment relates to the general quality of adult education programs. The General Accounting Office [GAO] reported in 1995 that adult education and literacy programs funded by the U.S. Department of Education have no defined objectives, valid assessment instruments, or accurate program data.

In the early part of the twentieth century, state departments of education and local school boards played an active role in the Americanization of immigrants. They committed resources to adult education in evening and weekend classes because they recognized the importance of economic and civic incorporation into their communities. Similarly, many turn-of-the-century businesses participated in the Americanization movement, recognizing the benefits to their operations accruing from a literate, educated workforce.

Responding to requests from its limited English-speaking employees, the United Electric Control Corporation in Watertown, Massachusetts in 1992 launched an educational and vocational skills training program. Em-ployees are given time off from work to take courses in a program that is so successful that it led to the formation of a consortium of Boston area high-technology companies to provide the same services. In this case, the program was given a jump start by a federal workplace literacy program grant.

There has been a shift away from this once widely-held public perception of immigrant adult education as a local responsibility, with its local community- and school-based programs. The source of funding is federal and state (as compared to kindergarten through grade twelve education that is financed primarily through local taxes). While many local school districts continue to provide classrooms and other resources, others do not. In this setting of excess demand for adult education, volunteers and low-cost options do exist. Access to relatively inexpensive classroom space often is a major impediment to program implementation. But—even though publicly-owned classroom space is often available and unused during evening and weekend hours—such limitations persist.

In recognition of the benefits they receive from immigration, the Commission urges leaders from businesses and corporations to participate in skills training, English instruction, and civics education programs for immigrants. Religious schools and institutions, charities, foundations, community organizations, public and private schools, colleges and universities also can contribute resources, facilities, and expertise. All of these sectors benefit from having skilled, English-speaking workers and residents. For example, local school systems could open schools after hours to community groups providing English instruction on a volunteer basis, and businesses could provide employees the opportunity for such classes at the jobsite. Such public/private partnerships can contribute in many ways to a greater range of educational opportunities for immigrants.

The Boeing Company and the International Association of Machinists provide training and skills development to current and laid-off workers that includes English as a Second Language and professional English development. Boeing also provided in-kind production services for a community-based organization naturalization video series in eight languages.

NATURALIZATION

Naturalization is the most important act that a legal immigrant undertakes in the process of becoming an American. Taking this step confers upon the immigrant all the rights and responsibilities of civic and political participation that the United States has to offer (except becoming President). The Commission reiterates its belief that no action should be taken that detracts from the appeal of citizenship as an opportunity to become a member of the polity. The naturalization process must be credible, and it must be accorded the formality and ceremony appropriate to its importance.

Maid Bess, a contract apparel business in Salem, Virginia provides free on-site English instruction to its refugee employees with the help of a local refugee resettlement agency. Among its more than 400 employees, 17 national and ethnic groups are represented. On its annual "International Day," all employees are encour-aged to dress in the traditional costume of their native country or that of their ancestors.

The Commission believes that the current legal requirements for naturalization are appropriate, but improvements are needed in the means used to measure that an applicant meets these requirements.

To naturalize, legal immigrants must meet certain threshold requirements; these have remained remarkably consistent throughout our history. At present, to naturalize, a legal permanent residents must reside in the United States for five years (three years for spouses of

The Commission believes that the current legal requirements for naturalization are appropriate but improvements are needed in the means used to measure that ***an applicant meets these requirements.***

U.S. citizens and legal permanent residents who serve in the military); demonstrate the ability to read, write, speak, and understand English; pass a U.S. history and civics exam; be of good moral character; and take an oath of allegiance.

With regard to the specific legal requirements, the Commission supports:

- **Maintaining requirements that legal immigrants must reside in the United States for five years (three years for spouses of U.S. citizens and Lawful Permanent Residents who serve in the military) before naturalizing**. We believe five years is adequate for immigrants to embrace, understand, and demonstrate their knowledge of the principles of American democracy.

- **Improving the mechanisms used to demonstrate knowledge of U.S. history, civics, and English competence.** The Commission believes that the tests used in naturalization should seek to determine if applicants have a meaningful knowledge of U.S. history and civics and are able to communicate in English. The current tests do not adequately assess such understanding or abilities. The civics test, for example, relies on memorization of discrete facts rather than on substantive understanding of the basic concepts of civic participation.

  INS district offices vary significantly from each other in the methods by which they administer the test and in the threshold number of correct answers needed for passage. In some cases, examiners scale the tests to the perceived educational abilities of applicants. The lack of uniform standards governing whether an applicant has satisfactorily fulfilled the

The nonprofit Arlington Community Foundation in Virginia funds and organizes grassroots programs to assist immigrants in their transition to American society. It sponsors local community organizations, festivals, and focus groups to identify and address sources of tension be-tween longtime residents and newcomers. It also supports local initiatives to assist immigrant entre-preneurs and parents of school-age children to understand how American institutions work. In 1995, it founded the Washington Partnership for New Americans to encourage naturalization.

requirements is disturbing. Such inconsistencies pose undue confusion for qualified legal residents and undermine public confidence in the naturalization process.

The Commission believes the tests should be standardized and aim to evaluate a common core of information to be understood by all new citizens. The U.S. history and civics test should assess whether applicants understand the basic principles of U.S. government: for example, what it means to have freedom of speech or the freedom to assemble. The English test should accurately and fairly measure an immigrant's ability to speak, read, and write; the current practice of dictating English sentences for applicants to write is not an effective means of testing English proficiency.

INS is now undertaking a full review of its interview and testing criteria, including the content and format of the English and civics portions of the test. The Commission encourages officials responsible for naturalization to consult and enlist the assistance of professional educators, pedagogical experts, and standardized test providers in the development of new history/civics and English standards and tests. Consideration should be given to separating the English reading, writing, and comprehension components from the personal interview. Often, applicants are nervous about making a mistake during the interview and demonstrate less English proficiency than they may have. This separation also would work to the advantage of those responsible for adjudicating applications as interviews would be reserved for applicants who had fulfilled the English and civics requirements, sparing scheduling and interviewing of unqualified applicants.

The Arlington County, Virginia, Wilson Center provides education and training for immigrants using federal refugee program funds for language and employment services. It offers citizenship and English as a Second Language classes (focusing on child rearing and family violence). As the school registration center for foreign-born children, it can readily inform immi-grants of its services.

The American Telephone and Telegraph Company in India Hill, Illinois, learned the lengthy naturalization process was of major concern for its employees. It worked with the Chicago INS office to distribute naturalization applications and study guides to employees and provided space for officials to conduct interviews and naturalization ceremonies. A total of 400 employees and their family members became citizens.

These new standards will be meaningful only if applied equitably and there is a much greater capacity to monitor the agencies that give the tests. [See below.]

A more predictable and standardized testing process also must include consistent and rational exemptions for elderly legal permanent residents. At present English language exemptions are granted to legal permanent residents aged 50 years or older who have lived in the United States at least twenty years and to those 55 years of age who have resided in the U.S. for at least fifteen years. Special consideration on the civics component is given to naturalization applicants aged 65 or older who have resided in the U.S. for at least twenty years. The Commission supports these exemptions. However, it makes little sense to confer such exemptions on long-term legal residents, yet not on more recent elderly legal residents who have had less time to acquire English proficiency. The Commission calls for a thorough review of the current testing exemptions and urges the Congress to consider additional, narrowly-tailored exemptions to the English requirement for qualified elderly immigrants who have resided in the U.S. for fewer years than required by the current exemptions.

The Voter Education Registration and Action Program of the New England Literacy Resource Center in Boston, Massachusetts promotes adult literacy so that its students can take informed action on issues that concern them. The Center is supported by National Institute for Literacy grants under the 1991 National Literacy Act. In the November 1996 election, 467 out of 550 of the program's adult learners —85%— participated.

- **Expediting swearing-in ceremonies while maintaining their solemnity and dignity.** Approved applicants must take an oath of allegiance before U.S. citizenship is conferred upon them. Generally, the oath is administered in public ceremonies by federal judges. Most such ceremonies are solemn and dignified public affirmations of a mutual obligation that new Americans and their adopted country make to each other. However, in districts where the federal court has exercised sole jurisdiction to conduct the swearing-in cer-

emonies, long delays often result from crowded court calendars.

The Commission believes a more expeditious approach to the swearing-in ceremony should be adopted. Timely ceremonies need not sacrifice the ceremonial and traditional aspects of the ceremony that the Commission strongly believes are essential. The Commission believes the solemnity and pomp of the current judicial ceremonies should be maintained and could be enhanced by the inclusion of distinguished speakers. However, would-be citizens who have passed all requirements for naturalization should not be denied timely citizenship because of processing delays in scheduling swearing-in ceremonies.

Until 1990, the federal judiciary had sole jurisdiction to confer citizenship on an approved naturalization applicant. The Immigration Act of 1990, however, transferred authority to confer citizenship to the INS. Within one year, the Judicial Naturalization Amendments of 1991 reinstated the judiciary, albeit in a somewhat modified role. Consequently, judges who choose to exercise sole jurisdiction are granted forty-five days from notification of eligible applicants in which to perform swearing-in ceremonies. Despite the changes instituted by the 1991 Amendments, immigrants typically wait considerably longer to be sworn in as new citizens.

Such delays can have significant consequences for legal residents; they are unable to apply for particular jobs, travel abroad, vote, or receive certain benefits such as Food Stamps and Supplementary Security Income [SSI]. The Commission is concerned that as the number of newly-approved citizenship applicants increases, along with an increasing caseload

for the federal judiciary, the federal courts' capacity to perform timely ceremonies may be further hampered.

The Commission recommends that to reduce this waiting time Congress restore the Executive Branch's sole jurisdiction for naturalization. The Executive Branch should continue to work with federal judges as well as other qualified institutions and personnel, such as state courts or Immigration Judges, to ensure that swearing-in ceremonies are consistently conducted in a timely, efficient, and dignified manner. Eminent persons who would add dignity to the ceremony could be invited to participate as well. Standards of conduct should be developed for all such participants to assure, for example, that all remarks are free of partisan politics.

- **Revising the naturalization oath to make it comprehensible, solemn, and meaningful.** Taking the oath is a critical legal step in becoming a naturalized citizen. Its words convey the core meaning of becoming an American citizen. Thus, it is imperative that it be understandable by all who take it. We recommend that those naturalizing be given a written copy of the oath that they can read during the swearing-in and that they can keep as a meaningful memento. The current oath is not easy to comprehend. We believe it is not widely understood by new citizens. Its wording includes dated language, archaic form, and convoluted grammar. Although the 1952 statute does not prescribe any particular wording, it does require that the oath contain five elements: (1) support for the Constitution; (2) renunciation of prior allegiance; (3) defense of the Constitution against all

enemies, foreign and domestic; (4) true faith and allegiance; and (5) a commitment to bear arms or perform noncombatant service when required.

The Commission proposes the following revision of the oath as capturing the essence of naturalization.

> ***Solemnly, freely, and***
> ***without any mental reservation,***
> ***I,*** **[name]** ***hereby renounce under oath***
> ***[or upon affirmation]***
> ***all former political allegiances.***
> ***My sole political fidelity***
> ***and allegiance from this day forward***
> ***is to the United States of America.***
> ***I pledge to support and respect***
> ***its Constitution and laws.***
> ***Where and if lawfully required,***
> ***I further commit myself to defend them against all enemies, foreign and domestic, either by military or civilian service.***
> ***This I do solemnly swear [or affirm],***
> ***So help me God.***[4]

The Commission calls for urgently needed reforms to increase the efficiency and integrity of the naturalization process. The vast majority of applicants for naturalization are law-abiding immigrants who contribute to our society. The value of Americanization is eroded whenever unnecessary obstacles prevent eligible immigrants from becoming citizens. Its value also is undermined when the

The Commission calls for urgently needed reforms to increase the efficiency and integrity of the naturalization process.

[4] As is the case under current regulations, when applicants, by reason of religious training and belief or for other reasons of good conscience, cannot swear an oath, they may substitute "solemnly affirm" and delete "so help me God."

process permits the abuse of our laws by naturalizing applicants who are not entitled to citizenship. For the process of Americanization to succeed, it must provide fair and timely service to legal residents applying for citizenship. It must also earn the trust and confidence of the general public.

In August 1995, the INS launched an initiative to address many of the most serious impediments to naturalization, including a backlog in excess of 300,000 persons and processing times that in larger cities approached four years. Consequently, the Service hired more than 1,000 new personnel, opened several additional branch offices, and established direct mail centers.

While these new resources resulted in record numbers of naturalizations, improprieties in granting citizenship to criminal aliens and fraud in the testing process undermined the goals of the program. It is fair to conclude that the new program revealed many of the structural and managerial weaknesses of the overall naturalization process. Subsequent Congressional hearings and independent investigations demonstrate that many of the most serious problems preceded the new initiative and were exacerbated by the increasing number of applications.

The Department of Justice [DOJ] has launched a variety of new initiatives to reengineer naturalization. DOJ named a Director for Naturalization Operations charged with overseeing management and reform of the naturalization program, including quality assurance and field operations. DOJ also contracted with Coopers and Lybrand to conduct a two-year review of the implementation and administration of the INS naturalization program.

Recognizing steps already are underway to reengineer the naturalization process, the Commission supports the following approaches:

- **Instituting efficiencies without sacrificing quality controls.** In the Commission's 1995 report to Congress, we recommended that the Immigration and Naturalization Service and the Congress take steps to expedite the processing of naturalization applications while maintaining rigorous standards. Two years later, the naturalization process still takes too long, and previous efforts to expedite processing resulted in serious violation of the integrity of the system.

  Because of failures in processing that resulted in the naturalization of ineligible applicants, new procedures subsequently were adopted to reduce inadvertent naturalization of criminal aliens. These new procedures, while not foolproof in barring criminals from naturalizing, have led to processing delays. At the same time, adequate staffing remains a problem. Congress has authorized reprogramming of funds to hire additional staff, but the Committees permitted temporary hires for most of the new positions even though the number of applications remain large. An entirely temporary workforce with short contracts lends instability to a process that already has problems. Instituting a system that has sufficient continuity of personnel and that is both credible and efficient therefore remains a pressing need.

- **Improving the integrity and processing of fingerprints.** Before applicants for naturalization can receive citizenship, they must submit fingerprints for FBI review to determine if the applicants have any disqualifying criminal background. Problems that delay thousands of applications have been identified in the operation of private agencies taking the fingerprints of applicants for citizenship. These problems include smudged prints and failure of applicants to sign or properly complete forms. Further, no mechanism now ex-

ists to verify accurately that the individual submitting the prints is the person whose prints are on the application.

To improve this process, the INS placed restrictions on who may qualify to offer fingerprint services. INS now accepts only fingerprints provided by Designated Fingerprint Services [DFS] trained and authorized by INS. These include local law enforcement agencies, nonprofit agencies, and fingerprint convenience stores. These restrictions may improve the quality of the prints, but do nothing to ensure that fingerprint services consistently and competently verify the identity of individuals whose prints are submitted. While law enforcement agencies have a vested interest in preserving the quality of fingerprints, they have heavy workloads and do not always give high priority to naturalization requests. Nonprofit, community-based organizations appear to take clear fingerprints, but there are questions about their competence to assess the validity of identity documents.

The Commission believes than only service providers under direct control of the federal government should be authorized to take fingerprints. If the federal government does not take fingerprints itself but instead contracts with service providers, it must screen and monitor such providers rigorously for their capacity, capability, and integrity. Failure to meet standards would result in termination of the contract.

- **Contracting with a single English and civics testing service.** The Commission urges a fundamental restructuring of the policies and procedures with which private agencies test naturalization applicants for their knowledge of English and civics.

A 1991 regulation authorized the INS to recognize the results of private for-profit and nonprofit testing services. The rationale was that private testing of civics and English would help to adjudicate citizenship applicants more expeditiously. By 1994, six organizations had been authorized by the INS to administer the citizenship exam.

Congressional hearings during the fall of 1996 revealed disturbing weaknesses in the use of private testers that undermined the integrity of the citizenship test. In response to reports that private, for-profit testing services were engaging in price gouging, cheating, and fraud, INS investigated three sites. In April and May of 1996, INS made some changes to improve testing site oversight Local INS offices were directed to conduct unannounced inspections of citizenship-testing affiliate locations if the office did not already have an inspection plan in place. The congressional hearings revealed that private testers continued to be inadequately supervised or disciplined by either INS or their parent company.

The Commission recommends that the federal government contract with one national and respected testing service to develop and give the English and civics tests to naturalization applicants. Having one organization under contract should help the government substantially improve its oversight. Moreover, continuity with a highly-respected and nationally-recognized testing service will help ensure a high quality product.

- **Increasing professionalism**. While many naturalization staff are highly professional in carrying out their duties, reports

from district offices, congressional hearings, and complaints from naturalization applicants demonstrate continued dissatisfaction with the quality of naturalization services. The Commission believes that a culture of customer-oriented service must be developed.

Recent audits point to very high levels of noncompliance with established practices and excessive error rates even in such basic tasks as filling in the proper names and identifying numbers on forms. Mistakes pose two serious problems for the naturalization process. First, legitimate applicants for naturalization face unnecessary delays while clerical and other mistakes are corrected. Second, ineligible applicants, including felons, may be able to obtain citizenship through administrative error. While INS must pursue denaturalization of such improperly naturalized citizens vigorously within legal limits, it is difficult to reverse grants of citizenship once made. Recruitment and training of longer-term staff assigned to adjudicating applications and overseeing quality control would help overcome some of these problems.

- **Improving automation.** According to the INS, the number of naturalization applicants projected for fiscal year 1997 and each of the following few years will exceed 1.8 million. As more and more immigrants apply for naturalization and choose to become part of the American polity, there is a greater need for efficient and accurate recordkeeping. Current systems are inadequate to meet such a demand for service. Both the INS and FBI rely on paper rather than electronic files, which is inefficient and subject to permanent loss or misplacement of documents. The inability of INS to provide accurate data on the number of recently-naturalized citizens who had undergone full background investigations is a particularly glaring example of the present system's

vulnerabilities. The costs to applicants and to INS credibility are significant. The Commission is encouraged by plans to develop linkages among data sources related to naturalization. The Commission recommends continued funding for an up-to-date, advanced, electronic automation system for information entry and recordkeeping.

- **Establishing clear fee and other waiver guidelines and implementing them consistently.** Under current law, the Attorney General is authorized to grant fee waivers to naturalization applicants. The Commission has received accounts of legitimate requests being denied. The prospective increase in naturalization fees may precipitate more fee waiver requests or perhaps discourage applicants. Clear guidelines and consistent implementation are needed to ensure that *bona fide* requests are granted, while guarding against abuse.

  The 1994 Immigration and Nationality Technical Corrections Act provided exceptions to the English proficiency and civics requirements for naturalization for persons with physical or developmental disabilities or with mental impairments. After extensive consideration and opportunities for public comment, the INS published its final rule in March 1997.

  The new rule emphasizes medically determinable standards that promote integrity and fairness. Further, the new rule does not confer a blanket exemption. Hence, judging whether an applicant's disability would bestow a disability waiver is inherently complex.

  The Commission believes that rigorous and equitable interpretation of the new rule will require that adjudicators are properly trained. Further, implementation must be strictly monitored to ensure that exceptions allowed by law are made

available to otherwise qualified legal residents. Finally, to ensure that the qualifications and procedures are understood and adhered to, the Commission recommends a thorough public education effort.

A CREDIBLE FRAMEWORK FOR IMMIGRATION POLICY

In our previous reports, the Commission defined a credible immigration policy "by a simple yardstick: people who should get in do get in, people who should not get in are kept out; and people who are judged deportable are required to leave." By these measures, the U.S. has made substantial, but incomplete, progress. What follows are the Commission's recommendations for comprehensive reform to achieve more fully a credible framework for immigration policy.

LEGAL PERMANENT ADMISSIONS

The Commission reiterates its support for a properly-regulated ***system for admitting legal permanent residents.***[1] Research and analyses conducted since the issuance of the Commission's report on legal immigration support our view that a properly regulated system of legal permanent admissions serves the national interest. We reiterate that such a system enhances the national benefits while protecting against potential harms.

The Commission reiterates its support for a properly-regulated system for admitting legal permanent residents.

This position is supported by a recent report we commissioned from the National Research Council on the impacts of immigration.[2] The panel concluded that "immigration produces net economic gains for domestic residents" in the form of increased productivity and reduced consumer prices. The benefits go well beyond economic ones, however. The panel also identified social and cultural gains

---

[1] For a full explanation of the Commission's recommendations see *Legal Immigration: Setting Priorities,* 1995. See Appendix for summary of Commissioner Leiden's dissenting statement.

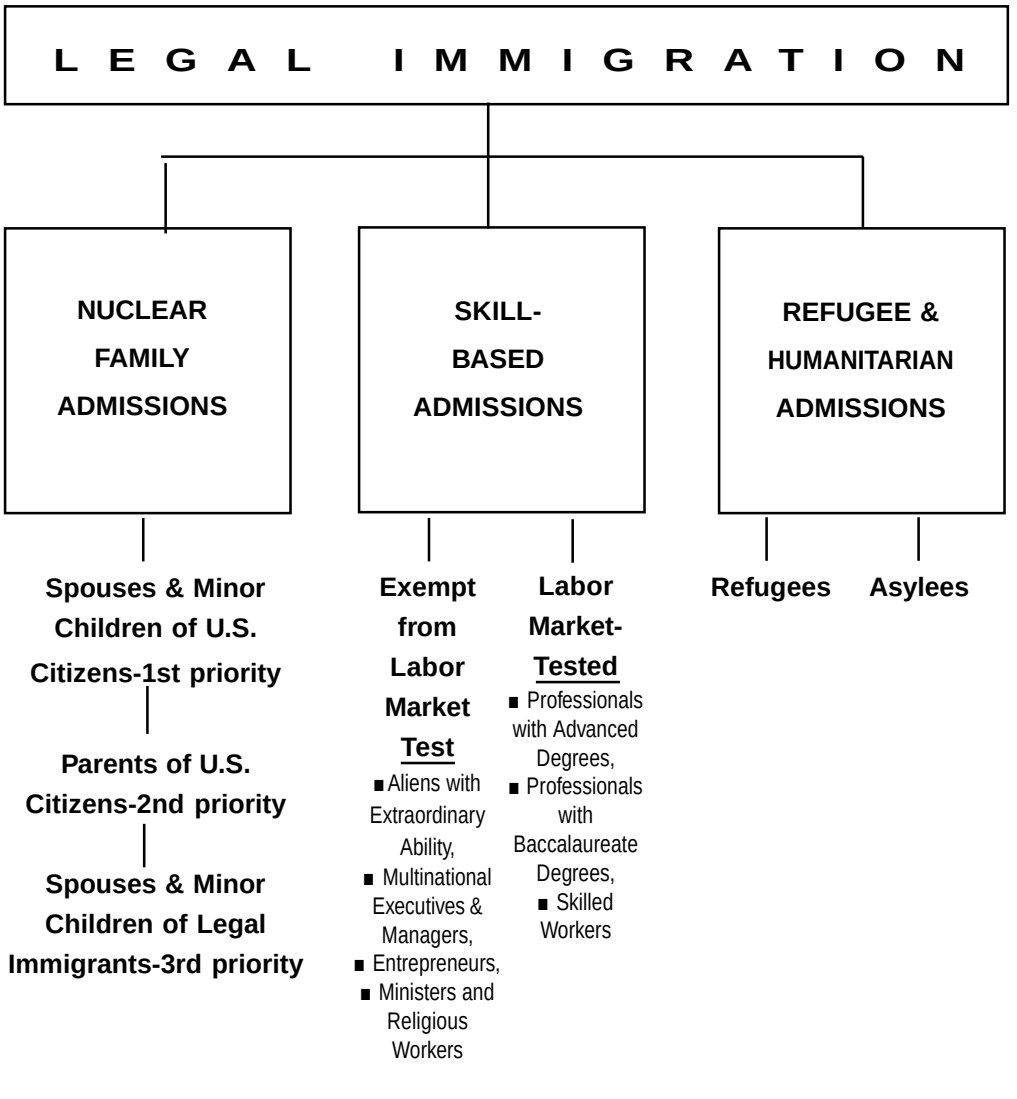
[2] National Research Council. (J.P. Smith, B. Edmonston, eds.). 1997. *The New Americans: Economic, Demographic, and Fiscal Effects of Immigration.* Washington, DC: National Academy Press. 62.

resulting from immigration, particularly through the entry of highly-talented immigrants who choose to live and contribute to the United States. The report continues: "Even when the economy as a whole gains, however, there may be losers as well as gainers among different groups of U.S. residents." The principal "gainers" are the immigrants themselves, owners of capital, higher-skilled workers who are complements to most immigrants (who are themselves lower-skilled) and consumers. The principal "losers" are the low-skilled workers who compete with immigrants and whose wages fall as a result. On a fiscal basis, the panel found national-level net contributions of tax revenues resulting from immigration, but the panel also identified significant net fiscal costs to the taxpayers of states with large number of immigrants. These high fiscal impacts are due, particularly, to the presence of sizeable numbers of lesser-skilled immigrants whose tax payments, even over a lifetime, are insufficient to cover their use of services.

The Commission urges reforms in our legal immigration system to enhance the benefits accruing from the entry of newcomers while guarding against harms, particularly to the most vulnerable of U.S. residents—those who are themselves unskilled and living in poverty. More specifically, the Commission reiterates its support for:

- **A significant redefinition of priorities and reallocation of existing admission numbers to fulfill more effectively the objectives of our immigration policy.** The Commission's more specific recommendations on priorities and procedures for admission stem not only from the above analysis of the effects of immigration but also from our review of the workings of the admission system. We argued in our 1995 report that the current framework for legal immigration—family, skills, and humanitarian admissions—makes sense. However, the statutory and regulatory priorities and procedures for admissions do not support the stated intentions of legal

Proposed Tripartite Immigration System



immigration—to reunify families, to provide employers an opportunity to recruit foreign workers to meet labor needs, and to respond to humanitarian crises around the world. During the two years since our report on legal immigration, the problems in the legal admission system have not been solved. Indeed, some of them have worsened as is discussed below.

We believe current immigration levels should be sustained for the next several years while the U.S. revamps its legal immigration system and shifts the priorities for admissions away from extended family and toward nuclear family and away from unskilled and toward higher skilled immigrants. Thereafter, modest reductions in levels of immigration—to about 550,000 per year, comparable to those of the 1980s—will result from the changing priority system.

The Commission continues to believe that legal admission numbers should be authorized by Congress for a specified time (e.g., three to five years) to ensure regular, periodic review and, if needed, change by Congress. This review should consider the adequacy of admission numbers for accomplishing priorities. It also should consider the economic and other domestic needs and capacities of the United States to absorb newcomers.

- **Family-based admissions that give priority to nuclear family members—spouses and minor children of U.S. citizens, parents of U.S. citizens, and spouses and minor children of legal permanent residents—and include a backlog clearance program to permit the most expeditious entry of the spouses and minor children of LPRs.**

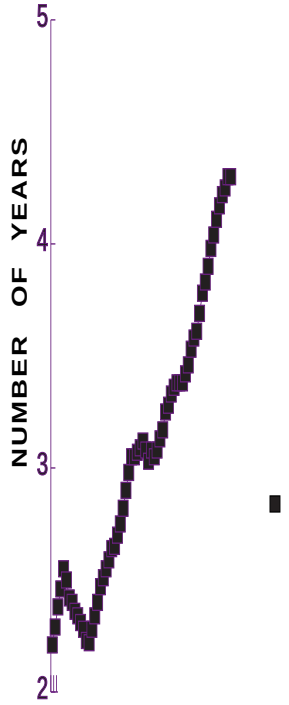
The Commission recommends allocation of 550,000 family-based admission numbers each year until the large backlog

of spouses and minor children is cleared. The backlog, which numbers more than 1 million persons, consists of the nuclear family members of legal immigrants who married after the U.S. spouse became a permanent resident, as well as spouses and minor children of aliens legalized under IRCA (most of whom are now eligible to naturalize). Numbers going to lower priority categories (e.g., adult children, siblings, and diversity immigrants), should be transferred to the nuclear family categories. Thereafter Congress should set sufficient admission numbers to permit all spouses and minor children of citizens and LPRs to enter expeditiously.

Since the Commission first reported its findings on legal admissions, the problems associated with family-based admissions have grown. In 1995, the wait between application and admission of the spouses and minor children of LPRs was about three years. It is now more than four years and still growing.[3]

Various statutory changes enacted in 1996 make it all the more important that Congress take specific action to clear the backlog quickly to regularize the status of the spouses and minor children of legal permanent residents in the United States. In an effort to deter illegal migration, Congress expanded the bases and number of grounds upon which persons may be denied legal status because of a previous illegal entry or overstay of a visa. Most important, a person un-

Waiting Time for Spouses and Minor Children of LPRs (FB-2A)



Source: DOS Visa Office
Visa Bulletin (1992-1997).

[3] It appears that the priority date (i.e., the cut-off date by which an approved petition must have been filed) has moved forward as much as it has only because of delays in processing applications for adjustment of status within the United States. When it became clear that INS could not keep up with the adjustment backlog, the Department of State moved up the priority date to continue processing visas overseas. As many of the adjustment applications are still to be processed, it is likely that there will be very little movement on the priority date during the next several months.

lawfully present for more than six months will be inadmissible for three years, and those unlawfully present for more than one year will be inadmissible for ten years.[4] If Congress decides not to renew the provision [known as Section 245(i)] that permits these individuals to adjust status within the United States, they will be unable to become legal immigrants even if they meet all other admission criteria.

An unknown, but believed to be large, number of spouses and minor children awaiting legal status are unlawfully present in the United States. While the Commission does not condone their illegal presence, we are cognizant of the great difficulties posed by the four-or-more-year waiting period for a family second-preference visa. U.S. immigration policy should not force legal immigrants to choose between family responsibilities and vows and their continued presence in the United States. The Commission believes no spouse or minor child should have to wait more than one year to be reunited with their U.S. petitioner.

The Commission is also concerned with the impact on nuclear family reunification of the provisions adopted in the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 [IIRIRA] to address perceived abuses in the use of parole. We agree that parole should be used only in exceptional circumstances and that Congress should be involved more directly in decisions to parole large numbers of individuals for permanent residence. We further recognize the validity of efforts to count long-term parolees against worldwide numerical ceilings. However, we do not agree with

[4] IIRIRA permits the Attorney General to provide a waiver for spouses and minor children if there is an extreme hardship to the U.S. petitioner. Although standards have not been set for implementing this provision, mere separation from family members generally has not counted as an "extreme hardship" in applying other provisions where extreme hardship is a ground for relief.

the IIRIRA provisions that count parolees against family-based admission numbers. Moreover, the language of IIRIRA requires the counting of those admitted with the intention that they reside permanently *and* those who are paroled for short stays but who are not known to have left one year later. For the first time in U.S. law, persons illegally in the U.S. would be counted against legal admission ceilings. This creates a conflict between policies. Moreover, inadequacies in current entry-exit controls mean that some parolees who leave the country will be determined to have remained and will also be counted against the legal admissions ceiling. Because the parole numbers are deducted from the family preferences, the new provisions hold the potential for delaying still further the already unacceptable delays in admission of nuclear family members.

The Commission believes that the national interest in the entry of nuclear family members outweighs that of more extended family members. We recognize that others disagree; they argue that the bonds to adult children and adult siblings can be as strong as the bond between spouses and with minor children. They also point to the valuable assistance provided by many extended families in setting up and running businesses and providing child care and other supportive services. Whatever the cultural and economic values attached to each family relationship, however, the far stronger responsibilities to one's spouse and minor children are well established in the U.S. We continue to believe that our family reunification system will remain seriously flawed until the spouses and minor children of LPRs are treated as a priority.

An end to extended visa categories is justified even apart from the large nuclear family backlog. The Commission pointed out in its 1995 report that the extraordinarily large

waiting list for siblings of U.S. citizens, and to a lesser extent, adult children undermines the integrity of the legal immigration system.

The backlog for siblings of adult U.S. citizens has stabilized during the past two years, but at a very large level. In January, 1995, there were 1.6 million on the waiting list; as of January 1997, the waiting list was 1.5 million. Except for oversubscribed countries, siblings who applied ten years ago are now eligible to enter. Admissions from the Philippines are of those who applied almost twenty years ago. These extended waiting periods mean that most siblings enter well into their working lives, limiting the time during which they can make a contribution to the U.S. economy. More than one-half of all the siblings and their spouses admitted in FY 1996 were above the age of 45. In other immigration categories, most principals are in their twenties or thirties.

The backlog for adult children is growing. In January 1995, there were about 70,000 unmarried sons and daughters of citizens, 500,000 unmarried sons and daughters of LPRs, and 260,000 married sons and daughters of citizens in the backlog. As of January 1997, the unmarried backlog had grown to more than 90,000 and 575,000, respectively, and the married children backlog is more than 310,000.

A particular concern is the "aging out" of children who were minors at the time of application, but who turned 21 years of age while awaiting their green cards. The Commission proposed in our 1995 report that the Immigration and Nationality Act [INA] be amended so that "a person entitled to status at the time a petition is approved shall continue to be entitled to that status regardless of his or her age."

- **Skill-based admissions policies that enhance opportunities for the entry of highly-skilled immigrants, particularly those with advanced degrees, and eliminate the category for admission of unskilled workers.** The Commission continues to recommend that immigrants be chosen on the basis of the skills they contribute to the U.S. economy. Only if there is a compelling national interest—such as nuclear family reunification or humanitarian admissions—should immigrants be admitted without regard to the economic contributions they can make. The reunification of adult children and siblings of adult citizens solely because of family relationship is not as compelling.

  A number of the NRC report's findings argue for increasing the proportion of immigrants who are highly-skilled and educated so as to maximize fiscal contributions, minimize fiscal impacts, and protect the economic opportunities of unskilled U.S. workers. The NRC research shows that education plays a major role in determining the impacts of immigration. Immigration of unskilled immigrants comes at a cost to unskilled U.S. workers, particularly established immigrants for whom new immigrants are economic substitutes. Further, the difference in estimated fiscal effects of immigrants by education is striking: using the same methodology to estimate net costs and benefits, immigrants with a high school education or more are likely to be net contributors while those without a high school degree are likely to be net costs to taxpayers.

  Shifting priorities to higher skilled employment-based immigrants will have a beneficial multiplier effect. The highly-skilled are, in effect, new seed immigrants who will petition for admission of their family members. The educational

level of the spouses and children of highly-educated persons tends to be in the same range. Hence, our society benefits not only from the entry of highly-skilled immigrants themselves, but also from the entry of their family.

The Commission's framework for legal skill-based admissions includes two broad categories. The first category would cover individuals who are exempt from labor market tests because their entry will generate economic growth and/or significantly enhance U.S. intellectual and cultural strength without undermining the employment prospects and remuneration of U.S. workers: aliens with extraordinary ability, multinational executives and managers, entrepreneurs, and ministers and religious workers. The second category covers individuals subject to labor market tests, including professionals with advanced degrees, professionals with baccalaureate degrees, and skilled workers with specialized work experience.

In our 1995 report, the Commission recommended allocation of 100,000 admission slots to skill-based immigrants. That number represented an increase of about 10 percent over actual usage of these visas, but a decline from the statutory ceiling of 130,000 admission numbers (i.e., 140,000 minus the 10,000 allocated to lesser skilled workers). We further recommended that unused skill-based admissions carry over to the following year's skill-based admissions.

The trend in admission of skill-based immigrants supports our 1995 recommendations, but also indicates the great need to monitor and revise admission numbers as needed. In FY 1995, 85,000 employment-based immigrants were admitted, including 7,900 unskilled workers. This number was artificially low, however, because of INS delays in adjudicating

applications for adjustment of status. In FY 1996, admissions totaled 117,000, including 12,000 unskilled workers. The 100,000 skilled admission numbers recommended by the Commission would have been sufficient to cover the period 1994-1996 (with the carry-over provision). However, if the FY 1996 spike turns out to be real (rather than an artifact of the adjustment of status delays of FY 1995), the number of employment-based visas may need to be revised.

The Commission also continues to recommend changes in the procedures used in testing the labor market impact of employment-based admissions. Rather than use the lengthy, costly, and ineffectual labor certification system, the Commission recommends using market forces as a labor market test. To ensure a level playing field for U.S. workers, employers would attest to having used normal company recruiting procedures that meet industry-wide standards, paying the prevailing wage, and complying with other labor standards. Businesses recruiting foreign workers also would be required to make significant financial investments in certified private sector initiatives dedicated to improving the competitiveness of U.S. workers. These payments should be set at a per-worker amount sufficient to ensure there is no financial incentive to hire a foreign worker over a qualified U.S. worker. Labor certification continues to be a time-consuming, unproductive way to protect U.S. workers from unfair competition from immigrant workers. The Department of Labor has tried to institute reforms that have streamlined the process for certain applications. The result, however, has been to slow down even further other applications that do not meet the streamlining requirements.

- **Refugee admissions based on human rights and humanitarian considerations, as one of several elements of** U.S.

leadership in assisting and protecting the world's **persecuted.**[5] Since its very beginnings, the United States has been a place of refuge. Today, when millions of refugees are displaced because of persecution, human rights violations, or warfare, U.S. leadership in responding to refugee crises is critical. The Commission believes continued admission of refugees sustains our humanitarian commitment to provide safety to the persecuted, enables the U.S. to pursue foreign policy interests in promoting human rights, and encourages international efforts to resettle persons requiring rescue or durable solutions. The Commission also urges the federal government to continue to support international assistance and protection for the majority of the world's refugees for whom resettlement is neither appropriate nor practical.

Admissions to the U.S. should be seen within the context of broader U.S. interests in protecting and assisting refugees worldwide. The Commission believes a comprehensive U.S. refugee policy should be coordinated by an office within the National Security Council [NSC] to serve as the White House focal point for domestic and international refugee and related humanitarian issues: to care for and protect refugees overseas; to resettle the few for whom U.S. resettlement is the only or best option and provide sensible transitional assistance to them; to operate an effective system for protecting *bona fide* asylum seekers in the U.S. while deterring those who are not; and to adopt a humane and effective plan to respond to mass migration emergencies.

The admission of refugees should be divided into two broad priority groups with numbers allocated accordingly. The first priority would be for refugees who are in urgent need

[5] For a full explanation of the Commission's refugee-related recommendations, see *U.S. Refugee Policy: Taking Leadership,* 1997.

of rescue and refugees who are the immediate relatives of persons already living legally in the United States. The second priority would include refugees whose admission is of special humanitarian interest to the United States but who are not in imminent danger where they currently reside. Admission numbers would be sufficient each year to guarantee entry to all *bona fide* applicants within the first priority and an agreed-upon number for the second priority Family members and close household members who are dependent on the principal applicant for financial or physical security should also be included among admissions within this priority system.

The United States should set annual numerical targets—but not a statutory limit—for future refugee admissions. The Commission recommends an improved consultation process that will help ensure that admission numbers and allocations meet U.S. national and international interests. The annual consultations should be strengthened by considering projections of admission levels and priorities for at least two years beyond the fiscal year under immediate consideration. Input should be solicited from a wide range of human rights and humanitarian organizations with knowledge of conditions precipitating the need for resettlement.

The United States also should use an active, inclusive process for identifying and making decisions regarding the admissibility of applicants for resettlement, conferring with a broad set of agencies in identifying possible candidates for resettlement. The U.S. government should confer with a broader set of agencies in identifying possible candidates for resettlement, including international and local human rights organizations, relief agencies providing assistance to refugees, and host governments.

The Commission further believes changes are needed to make the administrative processes for admission more flexible and streamlined in determinations of eligibility in order to respond quickly to refugee crises. Also, refugees should be admitted with LPR status except in cases where there has been inadequate opportunity prior to admission for the admitting officer to thoroughly review the case(s).

The Commission supports a continuing program of assistance to refugees after entry. The current array of assistance and services that characterize the resettlement program should be maintained, but with increased attention to services that prepare refugees for rapid economic self-sufficiency and civic participation. In addition, the federal, state, and local agencies involved in resettlement should develop a national plan for streamlining the program to address the complexity of the funding process and reporting requirements, the overlap of programs and responsibilities, and the lack of clear accountability for the outcomes of the program.

The current public/private partnership in the domestic resettlement program should be continued, but for a three-year trial period their division of responsibility should be more explicit, with (1) the public sector assuming responsibility for refugees eligible for the publicly funded public assistance programs and (2) the private sector being responsible for a limited duration program for refugees not eligible for the mainstream public programs.

The mechanisms by which the refugee program is funded should be strengthened through changes to the Refugee Act: (1) to specify a minimum time period of special refugee cash and medical assistance provided to refugees not eligible for Temporary Assistance for Needy Families [TANF] or Supplemental Security Income [SSI]; (2) to permit the appropria-

tion of "no year" money for the cash and medical assistance portion of the Office of Refugee Resettlement [ORR] budget; (3) to broaden the consultation process to ensure greater consistency between admission decisions and appropriation of funds to support refugee assistance and services; and (4) to establish a domestic emergency fund.

The Commission continues to recommend against denying benefits to legal immigrants solely because they are noncitizens. The Commission believes that the denial of safety net programs to immigrants solely because they are noncitizens is not in the national interest. In previous reports, the Commission argued that Congress should address the most significant uses of public benefit programs —particularly, elderly immigrants using Supplementary Security Income—by requiring sponsors to assume full financial responsibility for newly-arriving immigrants who otherwise would be excluded on public charge grounds. In particular, the Commission argued that sponsors of parents who would likely become public charges assume the responsibility for the lifetimes of the immigrants (or until they became eligible for Social Security on the basis of work quarters). We also argued that sponsors of spouses and children should assume responsibility for the duration of the familial relationship or a time-specified period. We continue to believe that this targeted approach makes greater sense than a blanket denial of eligibility for public services solely on the basis of a person's alienage.

The Commission continues to recommend against denying benefits to legal immigrants solely because they are noncitizens.

Basing eligibility for assistance on citizenship debases citizenship. We encourage immigrants to become citizens in order to participate fully in the civic life of the country. We do not want immigrants to become citizens solely because the alternative is the serious economic hardship that may result if benefits are lost or unavailable. In some cases, categorical denial of eligibility to legal aliens undermines the very purpose of our immigration policy. For example, the United States admits refugees, as noted above, to provide protection against the dangerous situations they encounter in their home coun-

tries and first-asylum countries. Some of the most vulnerable refugees requiring such protection are the elderly and disabled who will have the greatest difficulty meeting our naturalization standards.

This is not to deny that elderly and disabled immigrants pose a cost to U.S. taxpayers. The NRC report confirms this fact. By contrast, however, immigrants who come during their prime working years generally do not pose a net cost to the taxpayer over their lifetime. Most of the fiscal impact related to the presence of immigrants comes in the area of education, which can be seen as both a cost and an investment as education has long-term benefits to the United States both in a more skilled workforce and in higher income and resulting tax payments.

The Congress did not accept the Commission's recommendations to preserve the safety net. Some eligibility for elderly and disabled immigrants receiving Supplementary Security Income lost as of the enactment of the welfare reform legislation has been restored as a result of budget negotiations. Eligibility for food stamps and other programs designed for the working poor were not restored, however. And, future immigrants will be ineligible for SSI even if they become disabled after entry and have no other means of support.

The Congress did adopt, but in a modified version, the Commission's recommendation for binding affidavits of support. The 1996 legislation framed the requirement in two ways that differ from the Commission's recommendations. First, the legally-binding affidavit, with its more rigorous requirements regarding the income of sponsors, applies to some persons who are not likely to be public charges but not to others who are likely to require assistance. The affidavits apply to *all* family-based immigrants, not just to those who are likely to be public charges. By contrast, the new affidavit will not be used for other admission categories (for example, diversity immigrants) even if an immigrant is likely to be a public charge.

Second, under the new legislation, the same time periods and requirements apply to everyone who signs an affidavit. The affidavits are in force until the immigrant works forty quarters or becomes a U.S. citizen. The Commission believes the period of responsibility should be geared instead to the family relationship and likely period during which the immigrant may require assistance. For example, the sponsors of an elderly parent would be required to assume a longer (even an indefinite) period of support if the parent is of an age that makes it unlikely that he or she would become self-supporting. The responsibility for a spouse, however, would be for a time-limited period or for the duration of the marriage, whichever is longer. Under the new law, the responsibility of petitioners of younger immigrants is so open-ended that it does not provide a realistic or fair set of obligations. For example, if a U.S. citizen marries a foreign student with a professional degree and a job offer, the U.S. citizen must now take on a open-ended obligation to the foreign student, an obligation that carries on even if the marriage ends in divorce. If the immigrant spouse chooses not to work (and therefore doesn't meet the forty quarters requirement) and not to naturalize, the citizen remains responsible for his or her financial support (at 125 percent of the poverty level) indefinitely. The law has no "good cause" exception.

To conclude, the Commission's recommendations on legal admissions are as relevant today as they were in 1995. The Commission urges the Congress to take the measures needed to reform our legal immigration policies so it best serves the national interest in a well-regulated immigration system.

LIMITED DURATION ADMISSIONS

Persons come to the United States for limited duration stays for several principal purposes: representation of a foreign government or other foreign entities; work; study; and short-term visits for commercial or personal purposes, such as tourism or family visits. These individuals are statutorily referred to as "nonimmigrants." In this report, however, we refer to "limited duration admissions [LDAs]", a term that better captures the nature of their admission. When the original admission expires, the alien must either leave the country or meet the criteria for a new LDA or permanent residence. The term "nonimmigrants" is misleading as some LDAs entering the United States are really in transition to permanent residence, and other LDAs enter for temporary stays and become permanent residents based on marriage or skills.[6]

The benefits of a well-regulated system of LDAs are palpable. LDAs represent a considerable boon to the U.S. economy. The tourism and travel industry (domestic and international) is the second largest employer in the United States and generates 6 percent of the nation's Gross Domestic Product [GDP]. International tourism provides a net trade surplus (dollars international visitors spend here minus dollars U.S. visitors spend outside the U.S.) of $18 billion. Worldwide, the U.S. earned the most from international visitors—more than $64 billion.

Foreign students and workers often enrich the cultural, social, and scientific life of the United States. Our universities gain access to many talented students worldwide, thus maintaining the global competitiveness of the U.S. system of higher education. Foreign students give U.S. students the opportunity to learn about foreign

---

[6] Certain LDA categories, such as those for fiancé(e)s, intracompany transferees, and specialty workers provide explicit bridges to permanent immigration.

Limited Duration Admissions and Visa Issuances

Class of Admission	Admissions (Entries) 1996	Visa Issuances 1996
All classes*	24,842,503	6,237,870
Foreign government officials (& families) (A)	118,157	78,078

*Categories may not equal total because of omitted categories (e.g., fiancé(e)s of U.S. citizens, overlapping Canadian Free Trade Agreement professionals, unknown, NATO officials and professionals, and foreign media).

societies and cultures and, on returning home—often to positions of leadership—share their exposure to our democratic values, constitutional principles, and economic system. Foreign workers give employers timely access to a global labor market when they cannot identify or quickly train U.S. workers with knowledge and expertise required for a specific job. These worker programs also help companies conducting business both in the U.S. and internationally to reassign personnel as needed to maintain their competitiveness. As economies become increasingly integrated, companies are attracting more and more U.S. workers abroad as well.

Yet, LDAs pose problems for U.S. society under two principal circumstances: when the aliens fail to depart at the end of their legal stay; and when they present unfair competition to U.S. workers. The first problem is an enforcement one. Although overstayers represent a minute portion of the LDAs admitted each year, they are a significant part of the illegal immigration problem. The Immigration and Naturalization Service estimates that as many as 40 percent of the illegal aliens currently in the country originally entered with LDAs, many as short-term visitors. An equally pressing problem is the current inability to track the continued presence and whereabouts of many longer-term LDAs, particularly foreign students, after their arrival in the United States. This lack of capacity to monitor their presence exacerbates the problems of overstay and other violations of their legal status.

The second issue arising in limited duration admissions relates to the criteria for admission of foreign workers and the procedures used to determine their impact on U.S. workers. A proper balance must be struck in the LDA system between enhancing the productivity and global competitiveness of the U.S. economy through access to foreign workers and protecting U.S. workers against unfair competition.

The availability of foreign workers may create a dependency on

them. It has been well-documented that reliance on foreign workers in low-wage, low-skill occupations, such as farm work, creates disincentives for employers to improve pay and working conditions for American workers. When employers fail to recruit domestically or to pay wages that meet industry-wide standards, the resulting dependence—even on professionals—may adversely affect both U.S. workers in that occupation and U.S. companies that adhere to appropriate labor standards. For many of the foreign workers, even wages and working conditions that are very poor by U.S. standards are much better than those available at home. In a few egregious cases, businesses have hired temporary foreign workers after laying off their own domestic workforce.

The Immigration Act of 1990 imposed numerical limits on two employment categories where such dependence was feared: H-1B (specialty workers) is capped at 65,000 per year, and H-2B (unskilled workers) is capped at 66,000 per year. While the H-2B category is far from its numerical limits, the statutory cap on annual H-1B admissions was reached for the first time in FY 1997. INS announced in August 1997 the formation of a waiting list because approved workers would be ineligible to enter until the start of the next fiscal year. If the trend in applications continues, the cap is likely to be reached even earlier in FY 1998. Hence, employers petitioning late in the year would be required to wait for the admission of approved workers.

The current business users of the H-1B tend to fall into two distinct categories. One group of employers is clearly unlikely to become dependent on foreign workers but potentially is adversely affected by the numerical limits. These employers tend to hire relatively few foreign workers (for example, measured as a proportion of their overall workforce). Generally, they have identified specific foreign workers whose specialized skills are needed. Often, the company has done extensive recruitment in the United States and has been unable to find qualified workers with the specific skills they seek.

Because foreign workers represent a relatively small proportion of their workforce, there is little risk that foreign hires will cause either job displacement or wage depression for U.S. workers.

A second group of employers includes companies that make extensive use of H-1B professionals (again, as measured by proportion of their workforce). Sometimes, they seek approval in the same application for a large number of foreign workers who share minimal professional qualifications. But even within this more dependent group, there is variation in the risk posed by the importation of foreign workers to U.S. workers. Some employers recruit domestically or take other steps to employ U.S. workers, but they are unable to find sufficient professionals to fill their needs. Other employers recruit exclusively overseas and make no effort to employ qualified U.S. workers. They may utilize the H-1B workers in their own operations or contract the foreign workers to other employers.

Under current law, the numerical limits, and now required waiting time, pertain equally to the employer who has few foreign workers and the employer who has only foreign workers. Similarly, the same provisions apply to the employer who has recruited extensively within the United States and been unable to find a worker with the needed specialized skills and to the employer who does no domestic
recruitment.

The recommendations presented in this report seek to maximize the potential benefits for the U.S. economy and society resulting from the admission of LDAs while minimizing the potential negative effects. They build on—and in some cases reinforce—the Commission's previous recommendations for reforming the permanent legal immigration system. The overarching goal is to maintain the advantages that accrue to American society from entry of LDAs while protecting the legitimate interests of American workers and businesses from unfair competition.

Principles for a Properly-Regulated System

The Commission believes that LDA policy should rest on the following principles:

- **Clear goals and priorities**. LDA policy should clearly differentiate the goals of each set of visa categories, with procedures that reflect the requirements of each type of visa and subsequent admission. With more than forty different LDA visas provided for under current law, as discussed below, it is often difficult to identify how the goals of one category differ from those of others.

- **Systematic and comprehensible organization of LDA categories**. The statutory definitions, criteria, and procedures for visas and admission have developed in an *ad hoc* fashion. There is now accumulation of more than forty different LDA visas (subsumed under nineteen alphabetical headings), including overlapping categories for students, workers, and other visitors, as well as additional visas added to address the concerns of specific interest groups. Simplification of the system would enable businesses, educators, persons with LDAs, government officials, and the general public to understand more clearly the requirements for visa application and admission and the responsibilities of the persons with LDAs and their sponsors. Administration of the LDA system could be simplified, with attendant reduction in cost and confusion.

- **Timeliness, efficiency, and flexibility in implementation**. LDA policy should be implemented in a timely and efficient way with sufficient flexibility in law and regulations to respond to such domestic considerations as changes in the economy and our educational systems. Because of the time-limited nature of the stay, it is imperative that the system

allow admissions decisions to be made expeditiously while retaining a capacity to identify unqualified or fraudulent applications. Similarly, the provisions to protect U.S. workers must allow for timely and efficient mechanisms to investigate complaints and impose appropriate sanctions. While a good part of the LDA system now functions in a timely way, the diffusion of responsibility in foreign worker categories reduces the potential efficiency of that part of the system. The Commission's structural reform recommendations, discussed below, will help address certain inefficiencies.

- **Compliance with conditions for entry and exit and effective mechanisms to monitor and enforce this compliance.** The LDA system should be designed to allow for greater compliance, monitoring, and enforcement. Policies should specify clearly the conditions of entry and the penalties for noncompliance. It is the responsibility of the government, with the cooperation of the private sector where appropriate, to record, track, and report on those entering for limited duration stays. Americans expect that aliens will respect and observe the conditions of their temporary admission, including departure at the end of their lawful stay, and that they will be subject to government enforcement if they fail to comply with the conditions of their admission or if they overstay. Their sponsors (generally, businesses and schools) also bear responsibility for complying with all relevant requirements. Penalties for noncompliance must be commensurate with the offense. The current system does not yet have exit controls in place. In sum, the LDA system should meet a "truth-in-advertising" test.

- **Credible and realistic policies regarding transition from LDA to permanent immigrant status.** Realistic policies should continue to differentiate between LDAs who will

remain only temporarily and those who become permanent. For example, LDAs should continue to be able to transition to immigrant status as expeditiously as possible if they enter *bona fide* marriages with U.S. citizens or meet the justifiably high education, skill standards, and prescribed labor market tests of the permanent skill-based immigration categories.

- **Protection of workers from unfair competition and of foreign workers from exploitation and abuse**. LDA worker categories present special challenges in ensuring that U.S. workers are protected from unfair competition while legitimate foreign workers are protected from exploitation. Any system of LDA admissions must include protections for both U.S. and foreign workers, protections that are commensurate with the risk of unfair competition or abuse that the specific category presents. For example, lesser-skilled workers (whether American or foreign) who are newly entering the workforce and whose skills are easily replaced are generally more vulnerable—both to displacement and exploitation—than are more highly-skilled, specialized workers. Businesses that contract out their foreign workers to other businesses pose a greater risk for labor market violations because of the greater diffusion of employer responsibility. Also, employees of firms whose workforces consist primarily of temporary foreign workers, particularly from low-wage countries, are more vulnerable to exploitation; these foreign workers may be used to displace American workers because of their fear that any complaint about wages and working conditions might lead to deportation.

- **Appropriate attention to limited duration admission policies in trade negotiations**. Important policy decisions on admission of temporary workers occurred during negotiations on the North American Free Trade Agreement [NAFTA] and the General Agreement on Trade in Services [GATS].

Some are concerned that these treaty obligations restrict the capacity to reform our LDA policies by locking current immigration law into place or establishing minimum requirements to which changes in immigration law must adhere. In the future, both the Administration, in negotiating trade agreements, and the Congress, in passing enabling legislation, should assess more carefully the long-term ramifications of trade negotiations for immigration policy. The aim should be to ensure that options for future immigration reform are not unknowingly foreclosed.

The following recommendations aim at maximizing the potential benefits accruing from admission of LDAs while minimizing the potential harmful effects.

The Commission recommends a reorganization of the visa categories for limited duration stays in the United States to make them more coherent and understandable.

Framework

The Commission recommends a reorganization of the visa categories for limited duration stays in the United States to make them more coherent and understandable. The Commission recommends that the current proliferation of visa categories be restructured into five broad groups: official representatives; short-term visitors; foreign workers; students; and transitional family members. Subcat-

[7] The current system includes the J visa for cultural exchange, which is used for a variety of purposes, ranging from short-term visits to study and work. The workers include scholars and researchers, camp counselors, *au pairs*, and various others. Some work activities under the J visa demonstrate a clear cultural or education exchange; other work activities appear only tangentially related to the program's original purposes. Protection of U.S. workers by labor market tests and standards should apply to the latter group in the same manner as similarly situated temporary workers in other LDA categories. The Department of State should assess how better to fulfill the purpose of the Mutual Educational and Cultural Exchange Act of 1961 [Fulbright-Hays Act]. Such an analysis is particularly timely in light of the merger now being implemented between the Department of State and the United States Information Agency, which is responsible for administering the J visa.

egories of these groups may be appropriate in some cases. This reorganization reflects such shared characteristics of different visa categories as entry for like reasons, similarity in testing for eligibility, and similar duration of stay in the United States.

The definitions and objectives of the five limited duration admission groups would be:[7]

- **Official representatives** are diplomats, representatives of or to international organizations, representatives of NATO or NATO forces, and their accompanying family members. The objective of this category is to permit the United States to admit temporarily individuals who represent their governments or international organizations. The presence of official representatives in the United States is based on reciprocity; the United States expects similar treatment for its own persons in similar capacities abroad. Under current law, these individuals are admitted under the A and G visas. For the most part, members of these groups are admitted to the United States for the duration of their status as official representatives.

- **Short-term visitors** come to the United States for commercial or personal purposes. In 1995 alone, an estimated 43.5 million inbound visitors from other countries spent $76 billion on travel to and in the United States (on U.S. flag carriers, lodging, food, gifts, and entertainment).[8] This supports the U.S. national interest in encouraging tourism and business exchange. The majority of short-term visitors enter the United States under the visa waiver program, which is available for nationals of countries demonstrating little visa

[8] The 43.5 million visitors include the admission entries of individuals from countries where a visa or visa waiver is required as well as those from Canada (no visa, visa waiver, or border crossing card required) and Mexico (border crossing card required).

abuse. (For these nationalities, visas are required for all other purposes). "Nonwaiver" nationalities must possess a B visa for tourism or business, or a C visa for transit. Some short-term visitors also enter with the J visa if they are sponsored by the U.S. Information Agency [USIA] or other U.S. government agency. Short-term visitors generally have little or no effect on the U.S. labor market as they are severely limited in what they can do in the United States. Under current law, waiver visitors are admitted for ninety days, with no option for extension; visitors admitted with B visas are normally authorized a six-month stay, with flexibility to apply for another six months. Those in transit with C visas are given up to twenty-nine days' stay. The majority of visitors by their own volition stay for very short periods. This category also includes informants/witnesses (current S classification) whose temporary entry is in the U.S. national interest because their knowledge is needed for criminal prosecutions.

- **Foreign workers** are those who are coming to perform necessary services for prescribed periods of time, at the expiration of which they must either return to their home countries or, if an employer or family member petitions successfully, adjust to permanent residence. This category would serve the labor needs demonstrated by U.S. businesses with appropriate provisions to protect U.S. workers from unfair competition. Under current law, numerous types of foreign workers are admissible under the D visa for crewmembers, E visa for treaty traders and investors, H visa for "specialty workers" and other temporary workers, I visa for foreign journalists, L visa for intracompany transferees, O visa for aliens of extraordinary ability, P visa for performers and entertainers, Q visa for participants in cultural exchange programs, and R visa for religious workers. In addition, certain other workers enter under the TN provisions created

by NAFTA. There is a second, parallel system under which other workers enter with J visas because they are sponsored by an institution approved by the U.S. Information Agency to engage in cultural exchange. Some of these J workers are paid by their own governments or home institutions whereas others receive compensation from the U.S. institutions and businesses employing them. Also included as foreign workers are trainees, that is, individuals receiving on-the-job training by working in U.S. institutions. The present multiplicity of LDA work categories could be rationalized and made to parallel similar immigrant visa categories. [See below for specific recommendations regarding foreign workers.]

- **Students** are persons who are in the United States for the purpose of acquiring either academic or practical knowledge of a subject matter. This category has four major goals: to provide foreign nationals with opportunities to obtain knowledge they can take back to their home countries; to give U.S. schools access to a global pool of talented students; to permit the sharing of U.S. values and institutions with individuals from other countries; and to enhance the education of U.S. students by exposing them to foreign students and cultures. Students now enter under at least three visa categories: F visa for academic students; J visa, also for academic students (but generally including those whose education is paid by their own government or the U.S. government rather than themselves); and M visas for vocational students.

- **Transitional family members** include fiancé(e)s of U.S. citizens. These individuals differ from other LDAs because they are processed for immigrant status, although they do not receive such status until they marry in the U.S. and adjust. The Commission believes another category of transitional family members should be added: spouses of U.S.

citizens whose weddings occur overseas but who subsequently come to the U.S. to reside. At present, a U.S. citizen cannot petition for the admission of a spouse until after the marriage. Months often pass before the foreign spouse can come to the U.S. Under the Commission's plan, the newlywed should be permitted to enter the U.S. under a transitional family visa and then complete the paperwork for legal permanent resident status.

The Commission recommends that the current visa waiver pilot program for short-term business and tourist visits be made permanent upon the implementation of an entry-exit control system capable of measuring overstays.

Short-Term Visitors

The Commission recommends that the current visa waiver pilot program for short-term business and tourist visits be made permanent upon the implementation of an entry-exit control system capable of measuring overstays. A permanent visa waiver system requires appropriate provisions to expand the number of participating countries and clear and timely means for removing those countries that fail to meet the high standards reserved for this privilege. Congress should extend the pilot three years while the control system is implemented.

Most observers recognize that the waiver has been a positive factor in increased tourism and trade and in less processing time for many travelers at ports of entry. More than one-half of the short-term visitors from waivered nationalities come to the U.S. under the waiver, and INS reports little overstay or other immigration violations from these visitors. The Department of State [DOS] has been able to reallocate its relatively high-cost overseas resources to areas that need greater attention, such as increased antifraud efforts, coping with the Diversity Visa workload, and staffing new posts in the former Soviet Union. A key factor in the success of the waiver program is the electronic sharing of "watch list" data of persons ineligible for visas between the Department of State and INS on an almost immediate basis. Being able to screen visitors arriving with-

out visas at ports of entry serves the fundamental purpose of ensuring that statutorily ineligible aliens are not admitted to the United States.

Foreign Workers

Each year, more foreign workers enter the United States as LDAs for temporary work than enter as skill-based immigrants. In FY 1996, the Department of State issued almost 278,000 limited duration worker visas, including those for spouses and children. (Other LDA workers who changed status within the United States are not reflected in these statistics. Also not considered are LDA foreign students working in the United States during their course of study or as part of their practical training, or researchers entering under J visa programs.) By contrast, only 117,000 immigrant visa issuances and domestic adjustments of status in worker categories were recorded in FY 1996, far less than the legislated limit of 140,000.

The Commission recommends that the limited duration admission classification for foreign workers include three principal categories: those who, for significant and specific policy reasons, should be exempt by law from labor market protection standards; those whose admission is governed by treaty obligations; and those whose admission must adhere to specified labor market protection standards. Under this recommendation, LDA worker categories would be organized around the same principles that guide permanent worker categories. LDA workers would be subject to rigorous tests of their impact on the labor market unless they are exempt from these tests because their admission will generate substantial economic growth and/or significantly enhance U.S. intellectual and cultural strength and pose little potential for undermining the employment prospects and remuneration of U.S. workers.

The Commission recommends that the limited duration admission classification for foreign workers include three principal categories: those who, for significant and specific policy reasons, should be exempt by law from labor market protection standards; those whose admission is governed by treaty obligations; and those whose admission must adhere to specified labor market protection standards.

Within the labor market protection standards group, criteria for admission are consistent with the potential adverse effect of given categories of workers. The Commission believes adverse impact is broadly related to educational and skill level of the affected workers. Although there sometimes is an adverse effect from even the most highly-skilled and experienced foreign workers, the benefits of such workers are usually large to American society as a whole. They are likely to enhance the U.S. national interest through the generation of economic activity, including the creation of jobs. In general, the higher the levels of education and skill required in a given occupation, the more likely U.S. workers will be able to compete successfully with workers from abroad. Even at the very highest levels of skill and education, however, this generalization fits some high-skill occupations, but not others.

Entry-level professionals and lesser-skilled workers pose somewhat greater risk of displacing U.S. workers because their work can more likely substitute for that of U.S. workers. If they accept lower wages and benefits or poorer working conditions, they present unfair competition to U.S. workers and their employers may gain an unfair advantage over other U.S. employers. Similarly, unskilled foreign workers present the greatest potential for adverse impact because they are competing with some of the most vulnerable of American workers. Accordingly, the Commission proposes different sub-categories with labor market protection standards commensurate with the risks we believe are posed by the workers.

- **Those exempt by law from labor market protection standards** because their admission will generate substantial economic growth and/or significantly enhance U.S. intellectual and cultural strength and pose little potential for undermining the employment prospects and remuneration of U.S. workers. These include:

Individuals of extraordinary ability in the sciences, arts, education, business, or athletics, demonstrated through sustained national or international acclaim and recognized for extraordinary achievements in their field of expertise. These individuals now enter under the O visa. This category is comparable to the first priority in our permanent resident system. The U.S. national interest is well served by entry of individuals at the very top of their chosen fields who can contribute during their temporary stay to U.S. economic growth and intellectual and cultural strength.

Managers and executives of international businesses (current L visa), also comparable to the first priority in the legal permanent resident system. The global competitiveness of U.S. businesses is enhanced by the capacity of multinational corporations to move their senior staff around the world as needed. Often, there is only temporary need for a transfer, although permanent relocation may later be required. Under current law, the person with a LDA visa must have been employed by the firm, corporation, affiliate or subsidiary continuously for one year within the three years preceding the application for admission. As discussed below, the Commission believes greater safeguards must be in place to ensure that only *bona fide* international businesses benefit from this policy.

Professors, researchers and scholars whose salary or other compensation is paid by their home government, home institution, or the U.S. government in a special program for foreign professors, researchers, and scholars. Each year, professors, researchers, and scholars enter the United States on sabbatical from their own universities or research institutes, often with a J visa. Also in this category are foreign members of research teams cofunded by the United States and

other countries. These individuals present substantial benefits to the United States in the expertise and resources they bring, and they pose no threat of displacement of U.S. researchers as their salaries are from foreign sources or they enter under a U.S. government-funded program, such as the Fulbright Program, whose resources are earmarked through an appropriation process for foreign researchers and scholars.

Religious workers, including ministers of religion and professionals and other workers employed by religious nonprofit organizations in the U.S. to perform religious vocations and religious occupations. Under current law, religious workers must have had at least two years' prior membership in the religious organization (current R visa).

Members of the foreign media admitted under reciprocal agreements (current I visa). The U.S. benefits from the presence of members of the foreign media who help people in their countries understand events in the United States. Just as we would not want our media to be overly regulated by labor policies of foreign governments, the United States extends the same courtesy to foreign journalists working in the U.S.

- **Foreign workers whose admission is subject to treaty obligations.** This includes treaty traders, treaty investors, and other workers entering under specific treaties between the U.S. and the foreign nation of which the alien is a citizen or national. Under the provisions of NAFTA, for example, Canadian professionals are not subject to numerical limits or labor market testing; Mexican professionals continue to be subject to labor market tests, but will be exempt from numerical limits in 2003.

- **Foreign workers subject by law to labor market protection standards.** These are principally:

  Professionals and other workers who are sought by employers because of their highly-specialized skills or knowledge and/or *extensive experience*. Included in this category are employees of international businesses who have specialized knowledge (now admitted under the L visa) and professionals (now covered by the H-1B visa). A diverse range of individuals may be admitted in this category, including, but not limited to, university faculty and researchers with advanced degrees, accountants and lawyers with specialized knowledge of the tax and legal codes of other countries, and electrical engineers and software systems engineers with specialized knowledge needed for systems design. This category would also cover highly-skilled workers without professional degrees if they have substantial experience in their occupation. This category includes as well aliens now admitted under the H-1B visa who have a bachelor's degree but little specialized expertise or experience.

  Trainees admitted to the United States for practical, on-the-job training in a variety of occupations. They now enter through the H-3 visa, practical training arrangements under the F visa, and the J visa provisions pertaining to physicians seeking graduate medical education and to some researchers with J visas engaged in post-doctoral studies. All of these groups have in common work in U.S. institutions as part of a training program. They are paid U.S. wages and, in many cases, are not readily distinguished from U.S. residents in the same type of on-the-job training activities.

  Institutions petitioning for foreign workers as trainees would be required to demonstrate that the principal purpose of the

program is training by showing a significant educational component to the work experience. Trainees would be paid the actual wages provided to U.S. trainees in similar programs. The trainees would be admitted for the specified duration of the training program. For example, a foreign physician admitted for graduate medical education would be admitted for the period of the specific residency program.

Artists, musicians, entertainers, athletes, fashion models, and participants in international cultural groups that share the history, culture, and traditions of their country. This category includes aliens now admitted under the P visa and Q visa, as well as fashion models admitted under H-1B visa, and athletes, musicians and other performers admitted under the H-2B visa.

Lesser-skilled and unskilled workers coming for seasonal or other short-term employment. Such worker programs warrant strict review, as described below. This category includes aliens now admitted with H-2A and H-2B visas. Requests for admission of unskilled and lesser-skilled workers should be met with heightened scrutiny. Temporary worker programs for lesser-skilled agricultural workers exert particularly harmful effects on the United States. The Commission remains opposed to implementation of a large-scale program for temporary admission of lesser-skilled and unskilled workers along the lines of the *bracero* program. Having examined the issue further during our consultations on LDA issues, we reaffirm our belief that a new guestworker program would be a grievous mistake.

Historically, guestworker programs have depressed the wages and working conditions of U.S. workers. Of particular concern is competition with unskilled American work-

ers, including recent immigrants who may have originally entered to perform the needed labor but who can be displaced by newly entering guestworkers. Foreign guestworkers often are more exploitable than lawful U.S. workers, particularly when an employer threatens deportation if the workers complain about wages or working conditions. The presence of large numbers of guestworkers in particular localities—such as rural counties with agricultural interests—presents substantial costs for housing, health care, social services, schooling, and basic infrastructure that are borne by the broader community and even by the federal government rather than by the employers who benefit from the inexpensive labor.

Despite the claims of their supporters, guestworker programs also fail to reduce unauthorized migration. To the contrary, research consistently shows that they tend to encourage and exacerbate illegal movements by setting up labor recruitment and family networks that persist long after the guestworker programs end. Moreover, guestworkers themselves often remain permanently and illegally in the country in violation of the conditions of their admission.

If new initiatives to reduce illegal migration were at some point to create real labor shortages in agriculture or other low-skill occupations, employers could request foreign workers through the LDA provisions that the Commission proposes for the admission of unskilled workers.

The Commission recommends that the labor market tests used in admitting temporary workers in this category be commensurate with the skill level and experience of the worker.

The Commission recommends that the labor market tests used in admitting temporary workers in this category be commensurate with the skill level and experience of the worker.

- **Employers requesting the admission of temporary workers with highly-specialized skills or extensive experience**

should meet specific requirements. Admission should be contingent on an attestation that:

The employer will pay the greater of actual or prevailing wage and fringe benefits paid by the employer to other employees with similar experience and qualifications for the specific employment in question. Actual wage rates should be defined in a simple and straightforward manner. By this recommendation, we do not intend a complicated, bureaucratically-defined wage analysis. Rather, businesses should be able to use their own compensation systems to determine appropriate wages and benefits for the individual foreign worker hired. The entry of a small number of highly-skilled foreign workers should have minimal effect on these wage scales, which will be determined by the majority of U.S. workers employed by the business. In the absence of a company-wide system that ensures equitable compensation for similarly situated workers, the employer would be required to attest to paying prevailing wages for that job category, wages that are typical of the enterprise or nonprofit company. [See below for recommendations for at-risk employers with a significant proportion of foreign workers.]

The employer has posted notice of the hire, informed coworkers at the principal place of business at which the LDA worker is employed and provided a copy of the attestation to the LDA worker employed.

The employer has paid a reasonable user fee that will be dedicated to facilitating the processing of applications and the costs of auditing compliance with all requirements. Currently no fees are collected by the Department of Labor [DOL] for either processing or monitoring purposes. In effect, this requires taxpayers to subsidize these programs.

To ensure that the employer, and not the foreign worker, pays the user fee, penalties should be imposed upon violators.

There is no strike or lockout in the course of a labor dispute involving the occupational classification at the place of employment.

The employer has not dismissed, except for cause, or otherwise displaced workers in the specific job for which the alien is hired during the previous six months. Further, the employer will not displace or lay off, except for cause, U.S. workers in the specific job during the ninety-day period following the filing of an application or the ninety-day periods preceding or following the filing of any visa petition supported by the application.

The employer will provide working conditions for such temporary workers that are comparable to those provided to similarly situated U.S. workers.

- **Certain at-risk employers of skilled workers [described** below] should be required to attest to having taken significant steps—for example, recruitment or training—to **employ U.S. workers in the jobs for which they are recruiting foreign workers.** The Commission is aware that some companies now petitioning for H-1B workers recruit exclusively in foreign countries. The Commission believes that U.S. recruitment or hiring efforts will help ensure that qualified U.S. citizens and permanent residents have access to these jobs. We do not recommend, however, that current labor certification processes be used to document significant efforts to recruit. These procedures are costly, time consuming, and ultimately ineffective in protecting highly-skilled U.S. workers.

Under the now expired H-1A visa program for the admission of LDA registered nurses, several alternative steps were described as meeting the requirement of timely and significant steps to employ U.S. workers. These alternatives include: operating a training program for such workers at the facility (or providing participation in a training program elsewhere); providing career development programs and other methods of facilitating workers to become qualified; paying qualified workers at a rate higher than currently paid to other similarly employed workers in the geographic area; and providing reasonable opportunities for meaningful salary advancement. Examples of other steps that might qualify as meeting the timely and significant requirement include monetary incentives, special perquisites, work schedule options, and other training options.

- **Employers requesting the admission of lesser-skilled workers should be required to meet a stricter labor market protection test.** Such employers should continue to be required to demonstrate that they have sought, but were unable to find, sufficient American workers prepared to work under favorable wages, benefits, and working conditions. They also should be required to specify the steps they are taking to recruit and retain U.S. workers, as well as their plans to reduce dependence on foreign labor through hiring of U.S. workers or other means. (For example, sugar cane growers in southern Florida who had petitioned for foreign workers had success in reducing their dependence on H-2A workers through mechanization.) Employers should continue to be required to pay the highest of prevailing, minimum, or adverse wage rates, provide return transportation, and offer decent housing, health care, and other benefits appropriate for seasonal employees.

The Commission recommends that categories of employers who are at special risk of violating labor market protection standards—regardless of the education, skill, or experience level of its employees—be required to obtain regular independently-conducted audits of their compliance with the attestations made about labor market protection standards, with the results of such audit being submitted for Department of Labor review. Certain businesses, as described below, pose greater risk than others of displacing U.S. workers and/or exploiting foreign workers. The risk factors that should be considered in determining whether stricter protection standards must apply include:

The Commission recommends that categories of employers who are at special risk of violating labor market protection standards be required to obtain regular independently-conducted audits of their compliance with the attestations made about labor market protection standards.

- **The employer's extensive use of temporary foreign workers.** Extensive use can be defined by the percentage of the employer's workforce that is comprised of LDA workers. It also can be measured by the duration and frequency of the employer's use of temporary foreign workers.

- **The employer's history of employing temporary foreign workers.** Those employers with a history of serious violations of regular labor market protection standards or specific labor standards related to the employment of LDA workers should be considered as at risk for future violations.

- **The employer's status as a job contracting or employment agency providing temporary foreign labor to other employers.** Risk of labor violations increases as responsibility is divided between a primary and secondary employer.

To ensure adequate protection of labor market standards, such employers should be required to submit an independent audit of their compliance with all statements attested in their application. The independent audits should be done by recognized accounting firms that have the demonstrated capacity to determine, for example, that

The Commission recommends enhanced monitoring of and enforcement against fraudulent applications and postadmission violations of labor market protection standards.

wages and fringe benefits were provided as promised in the attestation and conformed to the actual or prevailing wages and fringe benefits provided to similarly situated U.S. workers.

The Commission recommends enhanced monitoring of and enforcement against fraudulent applications and postadmission violations of labor market protection standards. To function effectively, both the exempt and nonexempt temporary worker programs must provide expeditious access to needed labor. The Commission's recommendations build on the current system of employer attestations that receive expeditious preapproval review but are subject to postapproval enforcement actions against violators. To ensure adequate safeguards for U.S. workers, the government agencies responsible for processing applications and enforcing the law must have adequate capacity to identify and act quickly against fraudulent applicants and to monitor postapproval violations of the terms under which foreign workers enter. More specifically, the Commission recommends:

- **Allocating increased staff and resources to the agencies responsible for adjudicating applications for admission and monitoring and taking appropriate enforcement action against fraudulent applicants and violators of labor market protection standards.** These agencies require additional resources to investigate potential fraud among applicants for temporary worker visas as well as violations of the labor market protection standards. Enhancing this capability has significant resource implications, especially if, as the Commission also recommends, such antifraud investigations are undertaken in a manner that does not delay visa adjudication and issuance. Increased costs required for more efficient adjudication of applications can be covered by applicant fees. However, additional costs incurred for more effective investigations of compliance with labor market standards will require appropriated funds.

Sufficient funds should be appropriated to provide the additional resources needed for adequate enforcement by the Department of Labor. These resources should be targeted at employers and contractors at special risk of violating labor market protection standards. Targeting these employers makes the most sense both in terms of economical use of resources and in protection of workers.

The Department of State also must have the capacity to make a proper investigation of cases in which fraud is suspected. This capacity is particularly needed in applications for admission of LDAs in exempt categories to ensure that use of these categories does not become a means of evading labor market protection standards. For example, the visa for intracompany transfers has been abused by persons setting up sham corporations. To comply with appropriate requirements for timely decisions, the government must have the resources to investigate suspected fraud.

- **Barring the use of LDA workers by any employer who has been found to have committed willful and serious labor standards violations with respect to the employment of LDA workers. Further, upon the recommendation of any federal, state, or local tax agency, barring the use of LDA workers by any employer who has been found to have committed willful and serious payroll tax violations with respect to LDA workers.** The law currently provides for such debarment for failure to meet labor condition attestation provisions or misrepresentation of material facts on the application. Implementation of this recommendation would enable penalties to be assessed for serious labor standards violations that are not also violations of the attestations. This would address an issue that has come to the attention of the Commission: the knowing misclassification of some

LDA workers as independent contractors, with subsequent failure to pay payroll taxes or other legally-required deductions to the appropriate governmental agency.

- **Developing an enforcement strategy to reduce evasion of the LDA labor market protection standards through use of contractors.** U.S. businesses' growth in contracting-out functions has raised questions of employment relationships and ultimate liability for employment-related violations, including those related to temporary foreign workers. A uniform policy for dealing with these situations is desirable for the enforcement agencies involved, as well as for employers, contractors, and workers.

Conclusion

Limited duration admissions are an important part of immigration policy because they are linked closely to the admission of legal permanent immigrants and to our policies for deterring unlawful migration. This report seeks to treat limited duration admission policy in a comprehensive fashion, building on the recommendations made by the Commission on other aspects of immigration policy. The opportunities presented by the admission of limited duration admissions are significant. With the type of regulation recommended herein, the United States will be able to continue to benefit from these admissions while mitigating potential harmful effects, particularly on vulnerable U.S. populations.

CURBING UNLAWFUL MIGRATION

In its first interim report to Congress this Commission recommended a comprehensive strategy to curb unlawful migration into the United States through prevention and removal.[9] That report focused on deterrence—steps that could prevent illegal entry and unauthorized work. The Commission found that curbing unlawful immigration required: (1) better border management; (2) more effective deterrence of the employment of unauthorized workers; (3) a more consistent benefits eligibility policy; (4) cooperative efforts with source countries; (5) improved data collection and analysis; (6) mechanisms to address migration emergencies; (7) and an improved capacity to remove deportable aliens. The Commission presented detailed recommendations on the first five elements of this strategy (border, worksite, benefits, source country, and data). Our report on refugee policy detailed more specific recommendations on the sixth, migration emergencies.[10] This final report provides more detailed recommendations on the seventh, removals.

Since 1994, the immigration system as a whole has undergone almost unprecedented change. As Congress, the public, and the Administration focused more keenly on immigration, the financial resources available to INS grew from $1.5 billion in FY 1994 to a projected $3.6 billion in FY 1998. During the same period, INS staffing is expected to rise 65 percent, from 17,000 in FY 1994 to more than 28,000 in FY 1998. Once in 1994,[11] and three times in 1996,[12] enactment of major legislation made substantive and substantial changes in laws affecting illegal migration. Many of these statutory and administrative actions sought to implement the Commission's 1994 recommendations.

Deterrence Strategies

The Commission reiterates its 1994 recommendations supporting a comprehensive strategy to deter illegal migration.

The Commission reiterates its 1994 recommendations supporting a comprehensive strategy to deter illegal migration. Despite the additional resources, new policies, and often innovative strategies adopted during the past few years, illegal migration continues to be a problem. In October 1996, INS released its latest estimates of the illegal alien population in the United States: some 5 million undocumented migrants reside in the United States, a number growing by approximately 275,000 annually; 41 percent of these are nonimmigrant overstays; the remaining 59 percent probably entered illegally and without inspection.

The Commission continues to believe that unlawful immigration can be controlled consistent with our traditions, civil rights, and civil liberties. As a nation committed to the rule of law, our immigration policies must conform to the highest standards of integrity and efficiency in the enforcement of the law. We must also respect due process. The Commission believes that the comprehensive strategy we outlined in 1994 continues to hold the best promise for reducing levels of illegal migration. These policies, combined with the structural and management recommendations detailed later in this report, can restore the credibility of our immigration system by both deterring illegal entry and facilitating legal crossings. The Commission emphasizes, however, that no one part of this strategy will, on its own, solve the problem of unauthorized migration.

More specifically, the Commission continues to support implementation of the following deterrence strategies:

- **An effective border management policy that accomplishes the twin goals of preventing illegal entries and facilitating legal ones.** Increased resources for additional Border Patrol officers, inspectors, and operational support, combined with

such new strategies as operations "Hold the Line," "Gatekeeper," and "Safeguard," have improved significantly the management of the border where they are deployed. The very success of these new efforts demonstrates that to gain full control, the same level of resources and prevention strategies must be deployed at all points along the border where significant violations of U.S. immigration law are likely to occur.

Implementing effective prevention strategies. In 1994, "Operation Hold the Line" in El Paso, Texas successfully challenged outmoded border control concepts. This effort then served as the model for efforts to control other parts of the border, particularly in the San Diego area. The result, "Operation Gatekeeper," utilizing a strategy described as "Prevention through Deterrence," began on October 1, 1994, and included the commitment of significant new resources and the implementation of innovative new strategies.

Phase I (1994) of the plan had the greatest impact on the area around Imperial Beach in San Diego County. For many years this area accounted for approximately 25 percent of illegal crossings across the southwest border. Utilization of new equipment led to apprehension of greater numbers, and use of new techniques cracked down on alien smuggling rings. Reinforcement of interior checkpoints helped capture those who made it illegally across the border.

Phase II (begun in June 1995) consisted mainly of reinforcing nearby ports of entry seen as the next likely route for aliens whose illegal entry was disrupted by "Operation Gatekeeper." INS placed additional service inspectors at the border, constructed fencing at strategic locations, installed a fingerprint identification system , and added increased lighting at ports of entry.

Phase III (begun in 1996) is designed to extend control over increasing sections of the southwest border as additional staff and equipment become available. The San Diego Border Patrol Sector now has almost 2,000 agents working along the border.

Where these new initiatives have been instituted, the number of people seeking to cross is significantly reduced. On Commission site visits, residents of El Paso and Imperial Beach, the main beneficiaries to date of the new enforcement efforts, cited reduction in vagrancy and petty crime as evidence of reduced illegal crossings through their communities. Preliminary research data reveal that it now takes longer and costs more to enter the United States illegally. Illegal migrants now must now cross through tougher terrain and need the assistance of smugglers. Migrant smuggling increasingly is becoming specialized and professionalized.

The 1997 Binational Study, *Migration Between Mexico and the United States,* reports that a systematic survey of border crossers indicates fewer actual crossers but longer periods of stay in the United States. Thus, it appears that while new border initiatives may deter some movements, they do not fully reduce either levels or impacts of illegal migration. In other words, border control is a necessary, but not sufficient, response to illegal migration.

Evidence also shows that in response to the new initiatives migrants have shifted their entry patterns. For example, as Imperial Beach and its neighboring communities came under control, the numbers of illegal entries rose in eastern San Diego county, the Imperial Valley, Arizona, and south Texas. As the Commission noted in 1994, the immigration

system must have the capacity to prevent entry across the southern border. Mobile, rapid response teams initially can help plug holes along the border, but eventually, a prevention capacity must be established in every likely crossing area.

Protecting human rights. Effective border management is not without its human toll, increased violence along the border, as well as deaths resulting from exposure to extreme weather in mountain and desert areas. Both border crossers and Border Patrol agents have been victims of this heightened violence.

Since the implementation of the border initiatives, incidents of violence against the Border Patrol have increased. Incidents of rock-throwing, a hazard to Border Patrol agents for years, have risen. Agents now face random gunfire from south of the border. Beginning in May of 1997, six reported sniper shootings in the San Diego sector were directed at Border Patrol agents. Sustained efforts to protect agents from such violence must be at the top of the policy agenda.

Efforts also must continue to warn potential illegal border crossers—while they are still in their countries of origin—of the increased physical dangers and legal consequences of trying to cross illegally. In particular aliens must be warned of the pitfalls of using smugglers, some of whom abandon border crossers and otherwise abuse them.

Site visits in Mexico demonstrate that already widespread knowledge exists about the new difficulties in entering the United States illegally; misinformation continues to abound as well. Residents in new sending regions such as Oaxaca, traditional sending regions such as Jalisco, and border cross-

ing points such as Tijuana, all spoke of the additional costs and dangers encountered in attempting to cross the border illegally.

The Commission continues to support efforts to monitor and reduce human rights violations and potentially violent confrontations between government personnel and those believed to be seeking illegal entry into the United States. The INS formed a Citizens' Advisory Panel [CAP] that met periodically from February 1994 through February 1997, a year beyond its original expiration date. During that time, the CAP discussed ways and means for averting potential human rights abuses and outright violence by INS employees against aliens. As a result, INS adopted a formal complaint procedure for reporting alleged abuses by government employees to their supervisors and for INS to respond to those complaints. At its February 1997 meeting, the CAP decided to disband in its present form. Discussions are now underway on how best to retain the CAP input in the INS decisionmaking processes, in delivering feedback for training and supervising INS border personnel, and in responding to complaints made against employees.

Improving ports of entry. Additional pressure on ports of entry also accompany enhanced border control. The various initiatives already undertaken provide guidance for other border sites. In San Diego, "Operation Gatekeeper II" included enhanced resources for inspectors to identify individuals entering with fraudulent documents or as impostors. A Port Court was established to place these persons into formal exclusion proceedings. Presiding Immigration Judges made clear to those receiving exclusion orders that they would face criminal penalties if they were apprehended attempting to reenter within one year. To ensure that word went out that these were not idle threats, the U.S. Attorney

pledged to prosecute these cases. A relatively small number of persons were apprehended attempting reentry after receiving an exclusion order at the Port Court.

This process has changed somewhat under the new expedited removal procedures mandated by the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, which took effect on April 1, 1997. Under the new procedures, an alien arriving at a port of entry with fraudulent documents or without documents is referred to secondary inspection, where he or she is advised about expedited removal.[13] If the alien does not indicate a fear of persecution or an intent to apply for asylum, the alien is fingerprinted, photographed and detained until removal, which in San Diego typically takes two processing days. The alien's identity is recorded in the INS IDENT database for immediate and future determination of repeated attempts at unlawful reentry. An immigration officer's determination to remove an alien under the expedited procedures is not subject to administrative or judicial review, except under only very narrow circumstances.

Immigration officials in San Diego report a significant increase in removals as a result of the new expedited removal provisions. These gains in the capacity to remove at the border are no doubt desirable goals for an immigration enforcement agency. However, a more reliable determinant

[13] IIRIRA permits the Attorney General to apply the expedited removal provisions to aliens in the U.S. who have not been admitted or paroled [EWIs] and who have not shown to the satisfaction of the immigration officer that they have been continuously present in the U.S. for the two-year period immediately preceding the date of the determination of inadmissibility. At present, the Attorney General has elected not to apply these provisions to EWIs, although she has reserved through regulation, the option to apply the expedited removal provisions at any time, to any alien specified in that section.

of the extent to which a law actually deters the conduct it seeks to address is the recidivism rate. Thus, the effective communication of the consequences attached to the removal of an alien as a result of the new provisions is a key ingredient of the efficacy of our immigration laws. Without such public education, certain individuals are likely to be undeterred by the type of sanction exacted under the new expedited removal procedures.

Although reliable data on reentry is not yet available, the San Diego district reports an apparent increase in recidivism following implementation of the new law. It appears that an order issued by an immigration inspector does not have the psychological force of an order issued by an Immigration Judge. What is gained in expediting by the new statutory process may be lost in increased recidivism.

To counter this trend, the San Diego district has instituted a three-strike system that corresponds with the changes mandated by the new law. This system was established with the cooperation of the INS, the Executive Office for Immigration Review [EOIR], and the U.S. Attorney's Office in response to reports of apparent recidivism among aliens turned away by the expedited removal process. The first strike occurs once the INS inspector issues an expedited removal order to the alien that carries a penalty of inadmissibility for up to twenty years in some cases and permanently if the offense involves the use of a fraudulent document.

The second strike—appearance before an Immigration Judge in Port Court—occurs once the alien is apprehended after having been removed for a previous immigration or criminal violation. This step provides a critical link to deterrence: personal communication of the consequences of violating an immigration law. At the hearing, the Immigration

Judge advises the alien of the administrative sanction resulting from the attempted illegal reentry after expedited removal (i.e., a bar to admission for some period) and also of the certainty of felony prosecution if the alien attempts reentry during that period. The presence of an Immigration Judge is considered a vital component to the credibility of the San Diego district's border enforcement. The clear, unequivocal notice of the penalty aliens are likely to incur at the third step, coupled with the prospect of time spent in prison, is predicted to have more of a deterrent effect than simply turning aliens away without providing adequate notice of the consequences of their conduct.

The third strike involves felony prosecution by the U.S. Attorney's office under 8 U.S.C. § 1326(a) for illegal reentry following deportation, exclusion, or removal or under § 1326(b) for illegal reentry by certain criminal aliens who likewise have been previously removed. The penalties for a conviction under these sections of Title 8 range from sentences of not more than two years to not more than twenty years and/or a fine.

The INS and the Border Patrol are in the process of linking the IDENT system to all sectors along the southwest U.S.-Mexican border. This is especially important in light of the apparent shift in border movements to the east. Moreover, proper coordination of this system with various other law enforcement agencies to identify criminal aliens and other immigration violators may enhance the cooperation between those agencies and heighten enforcement along the border. For example, within the constraints of privacy limitations, data on criminal aliens entered into the IDENT system and furnished to the U.S. Attorney's Office would allow that office more readily to identify and prepare the criminal alien cases it intends to prosecute under the § 1326 provisions.

San Diego also is a laboratory for initiatives to facilitate legal entries while guarding against the abuses referenced above. The Commission urged in its 1994 report that port of entry operations be improved to reduce long waiting times for legal crossings. We learned in El Paso that some illegal crossers had legal authority to enter, but because of the long waits, chose to use unauthorized avenues to enter. San Diego, along with several northern border sites, has been experimenting with a Dedicated Commuter Lane [DCL] to speed legitimate border traffic. This concept combines upfront screening of the applicant for a commuter pass and use of technology to ensure that the crosser is indeed the person who previously was screened. Another innovation in San Diego is a new working relationship between INS inspections and the Customs Service to open all traffic lanes and to improve the division of responsibility: INS currently runs the port for pedestrian crossing and Customs for cargo inspections. Responsibility for inspections at the vehicle lanes still is shared by INS and Customs.

Reducing visa overstay and abuse. Visa overstay and abuse of visas and Border Crossing Cards [BCCs], particularly through unauthorized work, continue to challenge effective border management. Most of those entering with visas and BCCs come for legitimate purposes, abide by the terms of their entry, and leave when required. Out of the millions of aliens who are inspected each year, only a very small proportion (about 150,000 per year) overstay for significant periods. Any efforts to reduce abuse must also consider the widespread benefits that accrue from most visa and BCC holders. A number of policy changes could help ease legal entry while reducing abuse. The Commission previously recommended, and Congress and the Administration have taken

action for, the development of new entry-exit controls for persons entering with visas, reissuance of Border Crossing Cards to give them greater integrity, and providing significant new resources for inspections.

Monitoring and evaluating new initiatives. The various intended and unintended consequences of the new resources, policies, and initiatives in and between ports of entry make clear the need for careful monitoring. The Commission reiterates its 1994 recommendation that a systematic assessment of the effectiveness of new border strategies be undertaken by internal and external evaluators. IIRIRA mandates a General Accounting Office five-year evaluation of border management. This study should be underwritten with sufficient resources and expertise to ensure that Congress and the Executive Branch gain an independent view of the new policies' effectiveness.

- **Reducing the employment magnet is the linchpin of a comprehensive strategy to deter unlawful immigration.** Economic opportunity and the prospect of employment remain the most important draw for illegal migration to this country. Strategies to deter unlawful entries and visa overstays require both a reliable process for verifying authorization to work and an enforcement capacity to ensure that employers adhere to all immigration-related labor standards. The Commission continues to believe the following areas of worksite regulation and enforcement require improvement:

Employment authorization verification system. In our 1994 report, the Commission concluded that the single most important step that could be taken to reduce unlawful migration was development of a more effective system for verifying work authorization.

A large majority of employers will comply with the law, and they will not knowingly hire illegal aliens. However, the widespread availability of fraudulent documents makes it easy for illegal aliens to obtain jobs because employers generally have no way of determining if the workers are authorized or not. The minority of employers who knowingly hire illegal aliens, often to exploit their labor, find protection from sanctions by going through the motions of compliance while accepting counterfeit documents. The absence of a secure verification process also heightens the potential for discrimination against legally-authorized, foreign-looking or -sounding workers because employers fear that they may be inadvertently hiring illegal aliens.

The Commission concluded that the most promising option for verifying work authorization is a computerized registry based on the social security number; it unanimously recommended that such a system be tested not only for its effectiveness in deterring the employment of illegal aliens, but also for its protections against discrimination and infringements on civil liberties and privacy.[14] The Commission urged the Administration "to initiate and evaluate pilot programs using the proposed, social security-based computerized verification system in at least five states with the highest levels of illegal immigration . . ." In the interim, we recommended that INS should continue to implement pilot programs already underway that permit employers to verify the work authorization of these newly-hired workers who attest to being aliens. The existing pilot, since expanded, was a good mechanism through which INS could develop the data and other systems that would be needed in the more extensive pilots envisioned by the Commission. They continued to

[14] The Concurring Statement of Commissioners Leiden and Merced can be found in the Commission's 1994 report.

have a fatal flaw, however, in that an illegal alien could attest to being a U.S. citizen and thereby escape verification by INS.

The Commission's recommendation for a verification pilot that involved both citizens and aliens was incorporated in modified form in IIRIRA.[15] Congress mandated that the Attorney General establish a pilot confirmation system using a telephone line or other electronic media. The Commissioner of Social Security was mandated to establish a reliable, secure method to verify the social security number provided by a new hire as part of the employment confirmation process. Pilot programs testing the new confirmation process were to be implemented in, at a minimum, five of the seven states with the highest estimated illegal alien population. Participation in the pilot programs is to be voluntary for most employers. The legislation mandated participation by federal agencies and the Congress. Companies violating employer sanctions provisions can also be required to participate. The Attorney General is to report on the pilot programs after three and four years of operation.

The first of these pilot projects was to begin not later than one year from enactment of IIRIRA, or about August 1997. The first pilot project, starting in Chicago, began in late August. Called the "Joint Employment Verification Project" [JEVP], the pilot involves INS and the Social Security Administration. The verification pilot will test many of the requirements of the "Basic Pilot Program" mandated in § 403(a) of IIRIRA.

---

[15] IIRIRA, Title IV—Enforcement of Restrictions Against Employment, Subtitle A: Pilot Programs for Employment Eligibility Confirmation, sections 401-405.

The JEVP will have prospective new employees fill out the current INS Form I-9, submit identification documents listed in the legislation, and include a photograph. Employers will then contact the Social Security Administration [SSA] through a touch-tone telephone (being developed under a contract with ATT) that will electronically verify identity and authorization/nonauthorization to work using the employee's social security number. If either of these is not confirmed, the prospective employee must be notified. The employee may then withdraw or contest this tentative nonconfirmation. In this case, the prospective employee has ten days in which to provide additional or corrected information to the employer. If this still does not produce confirmation of employment authorization, the employee will be told to contact SSA [for citizens] or INS [for noncitizens] to correct their record(s) and/or their status. During this confirmation process, employees cannot be terminated. If still unconfirmed at the end of the process, the employee then may be terminated. As mandated by IIRIRA, INS plans to expand implementation of the JEVP into five additional states by the end of September 1997.

In addition, IIRIRA mandates two other pilot projects, a "citizen attestation pilot project" and a "machine readable document pilot project." INS currently is formulating these additional pilot projects. The "citizen attestation pilot project" will be similar to the INS' current Employment Verification Program, while the "machine readable document pilot project" is a variation of the JEVP and the "Basic Pilot Project."

The current pilot programs are a useful step in improving verification, but they do not fully solve the problems we have identified. The Commission reiterates its support for

pilot-testing approaches that do not require employers to use the current I-9 procedure. The I-9 is flawed in several ways. First it is a document system, which is prone to counterfeiting. Second, it requires employees to specify if they are citizens or aliens. This latter requirement increases the potential for discrimination based on alienage or presumed alienage. Third, it presents an added paperwork burden for employers who must keep the I-9 file. The current pilot programs help address the first problem by providing for telephone or computer verification of information provided in the I-9. It does not address the second or third problems, however.

A system based on verification of an employee's social security number, with a match to records on work authorization for aliens, eliminates any determinations by the employer and can be implemented electronically, thus eliminating the need for work authorization documents. The Commission recognizes that the data systems are not yet in place for this preferred process to work. The federal government does not have the capacity to match social security numbers with INS work authorization data without some of the information captured on the I-9. Congress should provide sufficient time, resources, and authorities to permit development of this capability.

The Commission urges the Administration and Congress to monitor closely and evaluate the effects of these various pilot programs. As discussed in our earlier report, the evaluation should assess their effects in reducing fraud, reducing the potential for discrimination, reducing emplyers' time, resources, and amount of paperwork, and protecting privacy and civil liberties. The evaluation should be carried out by nationally-respected outside evaluators. It should be

conceived as a continuing evaluation whose results are used in modifying and improving the pilots as they are implemented.

Counterfeit documents. The Commission recommended action to reduce the availability of counterfeit documents and the fraudulent access to so-called "breeder documents," particularly birth certificates used to establish identity. The Commission is pleased to note progress in the development of new and more tamper-proof basic documents that could serve as verification documents until a general, nationwide verification system is fully in place. The Commission also believes that the federal government should develop a package of incentives and disincentives to encourage states and other localities to develop standards for issuing birth and death certificates and drivers' licenses. The Commission is pleased to note that its 1994 recommendation for imposing additional penalties on those producing and selling counterfeit documents was adopted in the IIRIRA.

Antidiscrimination strategies. In its 1994 report, the Commission expressed its concern regarding the discrimination that occurs against citizens and noncitizens as a result of the current employer sanctions system. To address this issue, the Commission recommended development of a new verification process to deter immigration-related discrimination. We also urged more proactive strategies to identify and combat immigration-related discrimination at the workplace, as well as a new study to document the nature and extent of the problem. Revisiting this issue three years later, the Commission finds that there have been a number of changes that are relevant to the Commission's recommendations.

First, the Office of Special Counsel [OSC] for unfair immi-

gration-related employment practices, formerly housed as an independent agency within the Department of Justice, has been incorporated into the DOJ's Civil Rights Division. This organizational change seems to have been well received within the Department as both the Division and OSC focus on protecting the rights of immigrants and racial and ethnic minorities.

The number of OSC staff, however, has decreased from thirty-six to about twenty-five since FY 1994. This downward trend harms OSC's ability to take the proactive role that the Commission recommended (e.g. increasing independent, targeted investigations and beginning testing programs). The Commission urges attention to this matter, as well as to the long delay in confirming a Special Counsel to head the office.

A significant portion of OSC's efforts have been directed toward the education of employees and employers, and we support these efforts. OSC has awarded 114 grants totaling $2.09 million since FY 1990 and contracted out for a five-year national public affairs/communications strategy. Its attorneys and staff have made 1,000 presentations in the last ten years, and its grantees have averaged 1,700 presentations per year. OSC also has coordinated its educational efforts with the Equal Employment Opportunity Commission, INS, and DOL and has Memoranda of Understanding with these and other agencies.

Despite this apparent coordination, however, OSC has not been involved in designing and monitoring the verification pilot programs. Reducing immigration-related employment discrimination against foreign-looking or -sounding persons was a key goal of the Commission's proposed verification

system. OSC should play a role in monitoring the verification pilots to see if the discrimination is indeed reduced as predicted.

The Commission also reiterates its recommendation for a methodologically-sound study to document the nature and extent of unfair immigration-related employment practices that have occurred since the General Accounting Office's 1990 report. Only through such a study can it be determined whether employer sanctions-related discrimination has increased or decreased and how the pilot programs compare with the current situation on this indicator.

In 1996, IIRIRA changed the INA by requiring that an intent to discriminate must be proven for an employer to be found guilty of violating IRCA's antidiscrimination procedures with respect to document requests. Some believe that the intent standard will be a difficult one to prove and that it provides the employer with a loophole. The actual effect of this provision will be known only as OSC implements the statutory change and should be monitored.

Labor standards enforcement. Protecting authorized workers from employment abuses and substandard conditions and practices remains an essential ingredient of a strategy to combat illegal migration. Employers who hire illegal aliens tend to violate other labor standards and *vice versa.* Recently uncovered examples of exploitation of illegal aliens, including indentured servitude, highlight the necessity of enhanced labor standards enforcement. The Commission recommended in our 1994 report the allocation of increased staff and resources to the Department of Labor for the enforcement of wage and hour and other labor standards. We continue to believe that these additional resources are necessary, and the Commission continues to urge Congress to

authorize and fund additional labor standards investigators whose work should target industries hiring significant numbers of illegal aliens. As described more fully later in this report, we believe that the Department of Labor should have full capacity and authority to sanction employers who fail to verify work authorization as part of the agency's duties in enforcing labor standards.

- **Restricting eligibility of illegal aliens for publicly-funded services or assistance except those made available on an emergency basis or for similar compelling reasons to protect public health and safety or to conform to constitutional requirements.** Although public benefit programs do not appear to be a major magnet for illegal migrants, it is important that U.S. benefit eligibility policies send the same message as immigration policy: Illegal aliens should not be here and, therefore, should not receive public assistance except in unusual circumstances. The Commission recommended drawing a line between illegal aliens and lawfully-resident immigrants with regard to benefits eligibility, in part to reinforce this message. Immigrants are welcome in the country and, therefore, should be eligible for our basic safety nets; illegal aliens are not welcome and should not receive our assistance. We continue to believe that this demarcation between legal and illegal aliens makes sense. The Commission urges the Congress to reconsider the changes in welfare policy enacted in 1996 that blur the distinctions between legal and illegal aliens by treating them similarly for the purposes of many public benefit programs.

- **Strategies for addressing the causes of unlawful migration in source countries.** An effective strategy to curb unauthorized movements includes cooperative efforts with source countries to address the push factors that cause people to seek new lives in the United States. The Commission contin-

ues to urge the United States government to give priority in its foreign policy and international economic policy to long-term reduction in the causes of unauthorized migration. The United States can take many unilateral steps to improve its immigration policies, but U.S. policies alone will not stop unauthorized migration.

Recognizing the complex motivations behind unlawful movements, the Commission advocated the following possible interventions, many of which have indeed occurred. They include: arrangements to facilitate trade and investment in sending countries; support for human rights and democracy building; peacekeeping operations; humanitarian assistance in countries of origin and first asylum; deployment of human rights monitors; human rights training for government officials in potential sending countries; humane treatment of citizens and minorities; and reconstruction programs after civil wars and civil conflicts. In its 1997 report on refugee policy, the Commission recommended that the U.S. government continue demonstrating leadership in international responses to refugee and related humanitarian crises, including concerted diplomatic and other efforts to prevent the emergencies from occurring.

To focus greater attention on the causes of migration, the Commission recommends development of immigration impact analyses of foreign policy and trade decisions with potential migrant sending countries. The Commission also calls for adoption of focused strategies for communities producing large numbers of U.S.-bound migrants and strengthened intelligence gathering to improve early warning of large unauthorized movements. Other efforts to reduce the pressures of migration from the sending countries would be helpful, such as programs to arrest environmental damage

throughout the hemisphere, to restore the environment in such areas as Haiti and Mexico, to improve rural development and agricultural productivity, particularly in those areas where land is becoming marginalized and unlikely to sustain the local population without an intervention strategy, and to address other environmental problems such as clearing land mines in rural Central America.

Given its proximity to the United States and its number of migrants, the Commission believes increased coordination with Mexico is essential to address problems related to migration. The Commission notes with satisfaction the efforts being conducted jointly by the government of Mexico and the United States to improve coordination strategies and actions on their respective sides of the border and encourages the continuation of such important dialogues. In particular, the Commission recognizes the work of the Binational Study on Migration Between Mexico and the United States, the Working Group on Migration and Consular Affairs, the various cross-border liaison groups established along the border, and efforts between the two countries to coordinate antismuggling efforts, regulate the movements of people across land borders, deter third-country nationals transiting Mexico *en route* to the U.S., curtail auto theft and train cargo theft, reduce border violence, and enhance cross-border law enforcement cooperation.

The Commission also notes that action has taken place at the regional level; annual discussions have been convened involving the U.S., Mexico, and Central American countries. Further, the U.S. has held direct discussions with other countries in the region, such as Cuba, with whom it signed an agreement to curb unauthorized migration of its native population.

Despite that program, the need remains for forward looking consultative mechanisms between the U.S. and other countries. These should focus on exploring future policies and their migration implications as well as developing various policy scenarios and options for addressing unauthorized migration. Joint data collection and analysis also would be useful in resolving some of the disagreements surrounding migration, for example joint solutions to address the economic and social costs of the migration.

- **Mechanisms to respond in a timely, effective, and humane manner to migration emergencies.** A credible immigration policy requires the ability to respond effectively and humanely to migration emergencies in which large numbers of people seek entry into the United States. These emergencies generally include *bona fide* refugees, other individuals in need of protection, and persons seeking a better economic life in the U.S. Failure to act appropriately and in a timely manner to determine who should be admitted and who should be returned can have profound humanitarian consequences. Further, an uncontrolled emergency can overwhelm resources and create serious problems that far outlast the emergency.[16]

  Leadership. Past experiences demonstrate that leadership and a chain of command must be established quickly during an unfolding mass migration emergency to ensure an effective response. The proposed National Security Council focal point for refugee issues should assume these responsibilities because of the political nature of the decisions, the need for high Executive Branch access, and the need for credibility that derives from sufficient authority and government experience.

---

[16] For a fuller discussion of the Commission's recommendation on mass migration emergencies, see *U.S. Refugee Policy: Taking Leadership*, 1997.

Regional advance preparation. Mass migrations are likely to continue within this hemisphere. To respond effectively and humanely to future crises, the U.S. and its regional partners need a plan for a regional temporary protection system. This plan should identify sites, prepare protection guidelines and processing procedures at the primary protection sites and other locations, and create a funding proposal that clarifies financial responsibilities and accounts for marginal additional costs. It also should include measures to avert and resolve crises and develop plans for implementing durable solutions.

Domestic advance preparation. The U.S. must also finalize its own federal contingency planning for migration emergencies that has been under development during the past decade (with review and revision as needed). The presence of a such a contingency plan identifying various scenarios, policy responses, and appropriate steps for implementing them can help avoid both dangerous and costly *ad hoc* decisionmaking and disruption of normal operations. An effective and viable emergency response, however, requires that the agencies have sufficient resources and authorities to carry out their responsibilities. Thus, as part of this process, the U.S. must develop a realistic financing strategy and mechanisms to trigger allocation of funds.

Increased coordination among federal agencies involved in emergency responses—as well as with state and local agencies—also is necessary to ensure that the appropriate participants are identified and involved in the discussions and that as many decisions and responsibilities as possible are agreed upon prior to emergency situations. This would facilitate emergency responses by reducing the reluctance of state and local government to be involved, by clarifying lines of authority, and by increasing trust between the par-

ties. If they had the statutory authority to allow them to respond rapidly and efficiently, agencies with operational responsibility for mass migration emergencies could be more effective. This operational responsibility must include the authority to assign tasks to other agencies as needed.

Removals

A credible immigration system requires the effective and timely removal of aliens determined through constitutionally-sound procedures to have no right to remain in the United States. As the Commission stated in its 1994 Report, if unlawful aliens believe that they can remain indefinitely once they are within our national borders, there will be increased incentives to try to enter or remain illegally.

Our current removal system does not work. Hundreds of thousands of aliens with final removal orders remain in the U.S. The system's ineffectiveness results from a fragmented, uncoordinated approach, rather than flawed legal procedures. The Executive Branch does not have the capacity, resources, or strategy to detain aliens likely to abscond, to monitor the whereabouts of released aliens, or to remove them.

A large number of aliens—more than 250,000 in the past eight years—have been issued removal orders but have never been removed.[17] [See chart: Comparison of Removal Orders and Actual Removals.] In studying how the current system produces such a large number of unexecuted final removal orders, the Commission finds that the removal process is neither conceived of nor managed as an integrated system.

---

[17] Prior to IIRIRA, such orders were referred to as "deportation" and "exclusion" orders.

Comparison of Removal Orders and Actual Removals

YEAR	1989	1990	1991	1992	1993	1994	1995	1996	1997 (1st half)
ORDERS	48,000	52,000	60,000	65,000	70,000	84,000	105,000	131,000	64,000
REMOVALS	34,000	30,000	33,000	43,000	43,000	45,000	51,000	69,000	42,000

Sources: INS, EOIR, Administratively Final Removal Order by Month: Summary, July 24, 1997

The Commission urges immediate reforms to improve management of the removal system and to ensure that aliens with final orders of deportation, exclusion, or removal are indeed removed from the United States.

The Commission urges immediate reforms to improve management of the removal system and to ensure that aliens with final orders of deportation, exclusion, or removal are indeed removed from the United States.

In its 1994 report, the Commission recommended that the top enforcement priority should be the removal of criminal aliens from the U.S. in such a way that their potential return to the U.S. will be minimized. The INS has made considerable progress recently in removing larger numbers of criminal aliens. This year, INS is on track to remove 70 percent more criminal aliens than were removed in FY 1993. Despite these advances, the actual number of criminal alien removals still lags behind the total number who should be deported from this country.[18]

INS has been able to increase the number of criminal alien removals by detaining previously incarcerated aliens after they complete serving their sentences, through conclusion of their proceedings, and removal can be effected. More significantly, INS and the Executive Office for Immigration Review developed the Institutional Hearing Program [IHP] through which removal hearings are held in the prisons. When final orders are issued in this setting, criminal aliens can be deported directly from state or federal prisons, alleviating INS' need to detain them during deportation proceedings. The Commission recommended enhanced use of the IHP in its 1994 report. As the recent GAO testimony cited above indicates, improvements are still needed to ensure that INS identifies and deports all removable criminal aliens.

Further, while the INS has increased criminal alien removals over the last several years, noncriminal alien removals remained static

---

[18] See, e.g., GAO Testimony, "Criminal Aliens: INS' Efforts to Identify and Remove Imprisoned Aliens Need to Be Improved," before the Immigration and Claims Subcommittee, Committee on the Judiciary, House of Representatives, July 15, 1997.

until 1996, as the chart comparing removal orders and actual orders indicates. The recent increase in noncriminal removals may be somewhat related to increased detention space and resources authorized by Congress. However, much of the increase appears localized, suggesting that other forces are at work. As the chart further shows, removals from the San Diego District represent much of the increase and are related directly to the establishment of a Port Court in 1995.[19]

Even with these increased removals, the system needs significant improvements before it can be regarded as credible, that is able to deport most of the aliens with final orders of removal. To achieve this goal will require a new approach to correct a fundamental flaw—the fragmentation in the current conception and management of the removal system. Each part of the system—Investigations, Trial Attorneys, and Detention and Deportation—acts independently, impeding the total system's efficiency and leaving no one accountable for growing numbers of unexecuted final orders of removal.

The system starts with INS investigations of potential immigration law violations. When investigators find such violations, they issue notices placing aliens in removal proceedings. At that point, the investigators are finished with their assigned tasks; they are never connected to the results of their work—whether the alien was ultimately ordered removed and actually deported. Nor is their performance evaluated in connection with actual removals or with the priority that policymakers place on the removal of particular catego-

[19] When "Operation Gatekeeper" changed the patterns of how aliens attempted to enter the U.S. illegally and resulted in a significant increase in the number of aliens trying to cross with false documents at the port of entry, the U.S. Attorney worked with INS and EOIR to establish a more expeditious removal process for aliens apprehended at ports of entry. Previously, such aliens were simply turned back to Mexico; under the new system, they were placed in exclusion proceedings at the newly created Port Court. The aliens were detained for a few days, and the exclusion proceedings were expeditious because they were uncontested.

ries of aliens. Investigators do not, as a matter of practice, distinguish among priorities when initiating the formal removal process; both the worst violators and those who may have good claims for relief are placed in the same costly and time-consuming proceedings.

Once the proceedings have commenced, the INS Trial Attorney is responsible for the case. The volume of cases for each Trial Attorney is very large; yet, again there is no considered prioritization about which cases to proceed against and which not. Key policymakers do not provide guidance to Trial Attorneys about prioritizing cases, and, even if such guidance were provided, Trial Attorneys say that they are not given sufficient time to review cases to determine whether a case is worth pursuing. Again, there is no connection to the ultimate aim of the system—removing those who should be deported.

The system suffers further because many aliens are unrepresented and thus do not receive advice on whether to go forward because they have a chance of being granted relief. As the Commission learned in studying the results of the Florence Representation Project [see below], the removal process works much more efficiently when aliens receive advice of counsel. Those with weak cases generally do not pursue relief through proceedings if they understand from counsel that they will be wasting their time. As the late Chief Immigration Judge Robie pointed out, representation generally makes the court system work more efficiently. For example, Immigration Judges often grant continuances to unrepresented aliens to give them time to obtain counsel. In certain types of cases (particularly asylum claims), some judges are hesitant to proceed in the absence of representation. When a final order of removal is issued, another INS office, Detention and Deportation, takes responsibility for the case. This office is charged with managing detention space and effecting removal. The reality is that there will never be enough

space to detain everyone who should be removed. Nonetheless, no plan has been devised to pursue alternatives. The only experiment the INS has launched is the Vera Appearance Assistance Program that plans to test the utility of supervised release on various limited populations [as discussed below]. Unfortunately, due to internal INS problems, that pilot may not gain access to one of the main groups it should test—asylum seekers who meet the credible fear standard. No strategy has been devised for determining when, after the first hearing on the merits, detention is advisable because the likelihood of absconding is higher. Notices ordering removable aliens to report for deportation, known as "run" letters, continue to be issued at a 90+ percent no-show rate. No strategy has been developed for picking up aliens with final orders even when there is a recent address.

Establishing a more effective removal system requires changes in the management of the removal process. More specifically, the Commission recommends:

- **Establishing priorities and numerical targets for the removal of criminal *and* noncriminal aliens.** The Commission encourages headquarters, regional, and local immigration enforcement officials to set these priorities and numerical goals. Based on the above analysis of removal orders and actual removals, it appears that beyond the very highest removal priority—convicted criminals—targeted priorities of particular categories generally have not been developed at the national and local levels. Nor has INS developed numerical targets for the removal of specific categories of noncriminal aliens. This absence of prioritization and performance measures generally precludes serious consideration of what strategies, resources, and training will be needed to effect the desired removals.

Establishing removal of criminal aliens as a priority and setting numerical targets helped identify such new strategies as the IHP. The same process can work with regard to other categories of aliens, as can be seen in San Diego. Aliens who attempted to enter there with fraudulent documents were singled out as a priority for removal with an exclusion order. Formerly, those presenting fraudulent documents were permitted simply to withdraw their application for admission with no penalty. Setting the priority to remove aliens attempting reentry led to the decision to increase Inspection staff, establish a Port Court, identify additional detention space, and gain a commitment from the U.S. Attorney to prosecute those who attempted reentry after exclusion.

Failed asylum seekers [as the Commission recommended in our June 1997 Refugee Report], visa overstayers, unauthorized workers in targeted industries, and those who use false documents are categories that require attention if our removal system is to become credible and deter abuse. Setting priorities and numerical targets will help the government manage what is potentially a huge caseload of removable aliens.

- **Local oversight and accountability for the development and implementation of plans to coordinate apprehensions, detention, hearings, removal, and the prevention of reentry.** With guidance on priorities, local managers in charge of the removal system would be responsible for allocation of resources to ensure that aliens in the prioritized categories are placed in the process and ultimately removed. Local managers also would be responsible and accountable for identifying effective deterrents to reduce the likelihood that removed aliens would attempt to reenter the U.S. Managers need to redesign the system so that resources are balanced from beginning to end. Right now, the system is lopsided

and disconnected. The front end (Investigations) drives the system, and the back end (actual removals) is neglected. That imbalance can be corrected if the local offices develop plans to coordinate apprehensions, detention, hearings, and the removal process in ways that target the particular priorities in different districts. As discussed above, the San Diego district has had some success in focusing on aliens trying to enter with false documents. After identifying this priority, the U.S. Attorney coordinated the key federal government actors to ensure that these aliens were placed into proceedings, either returned to Mexico or detained for several days awaiting the hearing, promptly removed after the issuance of a final order, and prosecuted if they reentered.

As discussed above, the local INS Trial Attorneys, who are part of the General Counsel's Office, currently do not play a significant role in driving the removal system. The Commission believes Trial Attorney offices should function in the same manner that U.S. and District Attorney Offices do. Those offices determine which cases they will prosecute; and these determinations guide detectives as to which cases they bring to the U.S. or District Attorney for prosecution. Congress should provide sufficient resources to support such initiatives. Based on the policy guidance and plans developed by headquarters, regional and local offices, the chief Trial Attorneys [now called District Counsel] should make it clear to investigators which cases they will pursue in proceedings and which cases they will not. Investigators should then target these priority cases. Local heads of Immigration Enforcement Offices should be held accountable for the planning and implementation of this reconceived removal system. To ensure such accountability, these local officials should have authority over both the prosecutorial and police functions.

- **Continued attention to improved means for identifying and removing criminal aliens with a final order of deportation.** The Commission reiterates the importance of removing criminal aliens as a top priority. Our recommendation regarding the importance of removing noncriminal aliens with final orders is not intended to shift the attention of the removal system away from this priority. Rather, both criminal and noncriminal aliens must be removed to protect public safety (in the case of criminals) and to send a deterrent message to *all* who have no permission to be here.

  To improve the effectiveness of the criminal removal system, criminal aliens must be identified as early in the process as possible. The local jail pilot project mandated by § 329 of IIRIRA should be used to help determine how early in the criminal process identification should occur. The Department of Justice and the state and local criminal justice agencies should develop uniform means of identification, and the data systems of these agencies should be linked to identify more effectively criminal aliens who should be removed.

  With respect to the Institutional Hearing Program, the GAO found that the INS (1) failed to identify many removable criminal aliens and initiate IHP proceedings for them before they were released from prison, and (2) did not complete the IHP by the time of prison release for the majority of criminal aliens it did identify. GAO recommended improved data systems to track the IHP status of each foreign-born inmate and the development of a workload analysis model to identify the IHP resources needed in any period to achieve overall program goals. The Commission believes that the development of uniform means of such identification and linked data also will help the program achieve its goals.

The Commission urges the Department of Justice to attend carefully to actual removals in two additional ways. First, we have heard serious complaints from foreign authorities that they are not being notified that the U.S. is returning a criminal alien. DOJ must develop an improved notification process so that appropriate authorities in the countries to which criminal aliens are being returned can plan for such returns and take these individuals into custody if necessary. Second, we also have learned that many criminal aliens are being returned unescorted. For public safety reasons, criminal aliens should be returned by escort.

- **Legal rights and representation.** The Executive Branch should be authorized to develop, provide, and fund programs and services to educate aliens about their legal rights and immigration proceedings. Such programs also should encourage and facilitate legal representation where to do so would be beneficial to the system and the administration of justice. Particular attention should be focused on aliens in detention where release or removal can be expedited through such representation. The alien would not have a right to appointed counsel, but the government could fund services to address some of the barriers to representation.

  Under the provisions of § 292 of the Immigration and Nationality Act, an alien placed in proceedings is guaranteed the privilege of being represented by an attorney or other qualified legal representative, but at no expense to the government. Under this system, the alien is provided with a list of local attorneys and accredited organizations practicing immigration law who might be able to provide legal representation. Studies have shown that the vast majority of aliens in proceedings before Immigration Judges are not represented by counsel. This is accounted for by several

factors including the lack of English proficiency on the part of aliens, a lack of understanding of the legal process and of their legal rights, the lack of funds to hire an attorney, and an inability to find someone available and willing to represent them. Securing the services of an attorney or otherwise qualified legal representative presents a particular challenge for detained aliens whose freedom is constrained, who have limited phone privileges, and who find themselves situated in locales not readily served by or accessible to the legal community.

Experience demonstrates that when aliens are represented in proceedings, cases move more efficiently, economically, and expeditiously through the system. Indeed, represented aliens with little or no chance of prevailing can be more readily weeded out of the system. Aliens who have legal representation are much more likely to appear at their hearings than unrepresented aliens. Fewer continuances are needed or granted in the case of represented aliens. Hearings take less time. Issues presented for decision by the immigration courts and on appeal are more readily narrowed. Applications for relief are better prepared and presented in immigration court. Appeals are more cogently presented and are supported by legal briefs. Simply put, when aliens in proceedings or on appeal have legal representation, the system works better.

The Commission visited the Florence Immigration and Refugee Rights Project in Florence, Arizona, a project that demonstrates the advantages of programs designed to educate aliens about their rights and that provides a triage system to secure representation for those with a likely avenue for relief. The Project screens detainees for eligibility for immigration benefits and relief from deportation, exclusion, or removal, informs aliens about their rights, and directly rep-

resents as many as it can handle, with the overflow referred out to *pro bono* attorneys. The Project has been recognized for its success and assistance in moving cases through the system while affording due process. An evaluation of the Project found that aliens with representation had a better opportunity to become aware of their rights and legal options. Many inside and out of government believe that the Florence Project reduces alien detention time, expedites removal by decreasing necessary immigration court time, and increases court efficiency. Representation also decreases anxiety and behavioral problems among detainees.

The Commission believes that programs like the Florence Project should be facilitated and encouraged. Moreover, the Commission believes that the Executive Branch should be granted the authority to develop, provide, and fund other programs and services that inform aliens about their rights and the proceedings in which they are placed and to otherwise facilitate legal representation where to do so is a benefit to the system. Under this approach, the alien would not have a right to appointed counsel, but the government could fund ancillary services, such as rights presentations, interpreters, transportation, attorney/client meeting places, and training to address some of the barriers to increased legal representation.

- **Prosecutorial discretion to determine whether to proceed with cases.** Guidelines on the use of prosecutorial discretion should be developed; local Trial Attorneys should be trained to exercise discretion and support staff should be provided to ensure that Trial Attorneys have the time needed to screen cases prior to hearings. Discretion should be exercised with the goal of establishing a more efficient and rational hearing system.

In addition to targeting priority cases, the District and U.S. Attorneys decide which of those cases to prosecute based on an assessment of the strength of each case. In contrast, by and large, the INS prosecutes all cases that appear to involve violations of law. The Commission is concerned about the cost of litigating every case, both in terms of the credibility of the system and expenditure of public funds. We have recommended setting priorities as a strategy to establish credibility and to send a deterrent message. Here we urge the development of a system based on a sensible goal: prosecution of those who actually will be removed.

To establish a removal system that operates efficiently by prosecuting appropriate cases and settling those, for example, where relief is likely to be established, guidelines should be developed and issued by the General Counsel. Trial Attorneys should be trained to create and apply these guidelines nationwide. Finally, Trial Attorneys need time to screen cases prior to a removal hearing and to determine whether the alien has a strong claim for relief. To free up their time, support staff should be provided to handle the clerical work that currently burdens the Trial Attorneys. By wisely applying their discretion, the Trial Attorneys could then focus their attention on immigration court cases that are likely to result in the removal of the alien upon completion of the proceedings. This "out-of-court" approach also would assist the Immigration Judges and the private immigration bar by reducing the amount of time all parties spend in immigration court.

- **Strategic use of detention and release decisions.** Detention space, always in limited supply, is in greater demand as the government has focused more on the removal of criminal aliens and as Congress mandates more categories to be detained. IIRIRA requires the Attorney General to detain all

aliens found inadmissible or deportable on criminal or terrorist grounds. The criminal grounds include convictions for certain crimes now categorized as "aggravated felonies" for which a sentence of one year imprisonment or more may be imposed. Congress enacted these changes knowing that current detention space and personnel were insufficient to execute such expanded detention requirements and allowed the Attorney General to waive these requirements for two one-year periods while developing the capacity to handle these developments. The Attorney General notified the Judiciary Committees of the insufficiencies for the first year. IIRIRA also requires the detention of asylum seekers during the credible fear determination process.

Detention needs to be used more strategically if the government is going to target and remove designated categories of aliens determined to be priorities in particular locales. If it appears that asylum abuse is getting out of hand in one locality, for example, detention space would be needed to ensure that failed asylum seekers are removed.

Alternatives to detention should be developed so that detention space is used efficiently and effectively. In 1997, INS initiated a three-year pilot program, created with and implemented by the Vera Institute of Justice, that may help define effective alternatives to detention for specific populations. The Vera Assistance Appearance Program aims to develop and validate with formal research a supervision program that will increase both appearances at immigration court proceedings and compliance with the legal process among those not detained, while ensuring efficient use of detention space. The program thus aims to address important removal problems: The Executive Branch can detain only a fraction of individuals in removal proceedings; those who are not detained often do not appear in court and rarely

comply with removal orders. The pilot will free up valuable detention space by keeping out of detention aliens who may eventually be granted relief. If the Vera pilot demonstrates the utility of supervised release, an assessment of chances for relief and community ties or supervision would assist the Department of Justice in determining more precisely when detention is needed in each case to ensure that aliens who ultimately receive no relief do not abscond. It is hoped that the pilot will provide insight into the use of reporting mechanisms as well as the role of community organizations who take responsibility for maintaining contact with and reminding those released of their responsibilities to the immigration court.

The Commission considers the Vera pilot of great importance to the development of an effective removal system. INS officials at headquarters and in the local offices should work together to see that this pilot serves as a valid test of detention alternatives. In particular, the pilot should be permitted access to those asylum seekers who meet the "credible fear" test for two reasons. First, detaining individuals who have met an initial threshold demonstrating their likelihood of obtaining asylum is not a good use of scarce detention resources. As the Commission stated in its Refugee Report, "credible fear" is an appropriate standard for determining who will be released from detention; it is not appropriate for determining who will gain access to an asylum hearing, except under exceptional circumstances. Second, asylum seekers who have met the credible fear test will enable the pilot to test the utility of supervised release and make recommendations on the role of community ties and sponsors.

Additional alternatives should be developed to address local situations. For example, in border communities, aliens with pending cases could be permitted to return to Mexico and come to Port Court for their hearing in lieu of detention, as occurs in San Diego. The aliens in such proceedings are told the consequence of their failure to appear—that they will be found excludable in absentia and criminally prosecuted if they attempt to reenter.

- **Improved detention conditions and monitoring.** Over the past two decades, INS has taken on significant responsibilities in detaining aliens. INS detains a broad range of aliens of both genders, from criminals to asylum seekers. While short detention periods typically are contemplated for those awaiting removal hearings, the results often are otherwise. The INS has also become the long-term jailer for a significant number of removable aliens from Cuba, Vietnam, and other nations. INS currently operates nine Service Processing Centers and, like the U.S. Marshals, contracts bed space with many state and local jails. In recent years, Congress has increased significantly resources for detention space: total available beds per day totaled 8,600 in 1996; INS is close to reaching its goal of 12,000 by October 1997.

  Serious problems have occurred, the most prominent in 1995 when the ESMOR Contract Facility in Elizabeth, New Jersey, was shut down following an incident in which detainees voiced complaints of physical abuse, stealing, and harassment by guards. INS' own investigation of the facility uncovered serious management problems. More regularly, complaints regarding local jails have included human rights abuses, overcrowding, poor nourishment, mixing of women

and juveniles with men and of asylum seekers with criminals, and lack of access to health care, counsel, family, and recreation.

Detention cannot be used effectively unless and until the conditions of detention are humane and detainees are free from physical abuse and harassment by guards. We have no doubt that appropriate criteria for all facilities can be promulgated, based on sound governmental judgment and consultation with concerned nongovernmental organizations. But most importantly, a system to monitor facilities and publish findings on a regular basis must be developed. Inspections must occur more than once annually.

Further, the Commission recommends that the Department of Justice consider placing administrative responsibility for operating detention centers with the Bureau of Prisons or U.S. Marshals Service. An immigration enforcement agency should not be shouldered with such a significant responsibility that is not part of its mission or expertise.

- **Improved data systems.** The Commission recommends that data systems link apprehensions and removals. Current data systems are unable to link an apprehension to its final disposition (e.g., removal, adjustment of status). In addition, INS statistics relate to events, not individuals. This significantly limits the use of apprehension and removal data for analytical purposes. The Commission urges development of data systems that link apprehensions and removals and provide statistics on individuals. This would foster a better understanding of apprehension as a removal tool and provide better information on recidivism.

- **The redesigned removal system should be managed initially by a Last-In-First-Out [LIFO] strategy to demonstrate**

the credibility of the system. Once a coherent system is organized and appropriate resources are assigned to removing deportable aliens—not simply to put aliens through proceedings—removals should proceed in a Last-In-First-Out mode. In this way, the government can send a credible deterrent message to failed asylum seekers, visa overstayers, users of counterfeit documents, and unauthorized workers, that their presence in the United States will not be tolerated. The LIFO model has worked successfully in the affirmative asylum system, allowing the government to demonstrate control over the current caseload and to quickly establish priorities for dealing with the backlog for enforcement purposes. It can provide both the measure of success for the removal system as well as convey the proper deterrent message.

The Commission urges Congress to clarify that the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 and the Antiterrorism and Effective Death Penalty Act of 1996 do not apply retroactively to cases pending when the new policies and procedures went into effect. As a matter of policy, the Commission believes that retroactive application of new immigration laws undermines the effectiveness and credibility of the immigration system. Applying newly-enacted laws or rules in an immigration proceeding that is pending results in inefficiency in the administration of the immigration laws. It also can raise troubling issues of fairness.

The Commission urges Congress to clarify that IIRIRA and AEDPA do not apply retroactively to cases pending when the new policies and procedures went into effect.

There is no uniform effective date for the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 in its entirety. Instead, and to the extent it has spoken on the matter, Congress has imposed several different effective dates depending on the provisions involved. Most of the new removal provisions became effective on April 1, 1997. The fact that a statutory provision takes effect upon enactment or upon a future date certain, does not re-

solve the issue of whether the provision applies to cases already pending. When new statutory provisions are applied to such categories of cases, it is generically considered a "retroactive" application of the law.[20]

Although retroactive application of new statutory requirements by Congress is legally permissible (subject to certain constitutional constraints), it does not constitute sound public policy. Ours is a system governed by the rule of law. In our view, retroactively changing the applicable rules once a legal proceeding has commenced not only is manifestly unfair, but also invites confusion, adds uncertainty, and fosters a lack of trust and confidence in the rule of law.

We are concerned as well that retroactively applying new statutory provisions results in inefficiency and simply does not make good sense given the current realities of administering the immigration laws. As fully discussed earlier in this report, hundreds of thousands of outstanding administratively final orders of deportation remained unexecuted long before the enactment of either IIRIRA or

---

[20] The analytical model for determining statutory retroactivity, set forth by the Supreme Court of the United States in *Langraf v. U.S.I. Film Products, Inc.*, 511 U.S. 244 (1994), is aptly encapsulated in the following excerpt from *Immigration Law and Procedure*, Gordon and Mailman, Chapter 61, Special Alert, SPA61-1, 2 (1997):

> [T]he first step is to determine whether Congress expressly defined the statute's proper reach. The language of the statute must be examined to determine whether it manifests an intent to apply to cases or conduct that arose before the law's enactment. For the statute to apply retroactively, there must be an "unambiguous directive" or an "express command" from Congress that it intended such application. In the absence of such an unambiguous directive, it must be determined whether the new statute "attaches new legal consequences to events completed before its enactment" or "would impair rights a party possessed when he acted, increase a party's liability for past conduct or impose new duties with respect to transactions already completed." If the statute has this effect, it should not apply retroactively.

AEDPA. Clearly, the system has had little problem in establishing sufficient grounds for deportation and exclusion under prior law. Moreover, although relief from deportation and exclusion under prior law was available, the number of granted applications was proportionally very small compared to the number of aliens in proceedings. The problem, then, has not been in ordering the deportation or exclusion of immigration violators, or in granting relief in a relatively small percentage of cases. The problem has been in actually removing aliens who have been found to be deportable, excludable, or removable following the conclusion of their proceedings.

As noted above, the system is not yet removing anything approaching 100 percent of the existing detained or nondetained criminal alien population for whom an administratively final order of deportation or exclusion already has been entered or who are otherwise deportable or excludable under prior law based on their criminal conduct. Moreover, the system has failed to remove significant numbers of noncriminal aliens against whom orders of deportation or exclusion have been outstanding for several years. Although retroactive application of the 1996 legislation will both significantly increase the numbers of removable aliens and decrease the numbers of aliens who might have otherwise qualified for existing relief, the system does not have the capacity actually to remove these added numbers of individuals. The resulting situation serves only to further erode the effectiveness and credibility of the immigration system as a whole.

ACHIEVING IMMIGRATION POLICY GOALS

INTRODUCTION

Restoring credibility and setting priorities—themes at the center of the Commission's policy recommendations on illegal and legal immigration, respectively—will not come to pass unless the government is structured to deliver on these policies. An effective immigration system requires both credible policy and sound management. Good management cannot overcome bad policy. Poor structures, lack of professionalism, poor planning, and failure to set priorities will foil even the best policies.

Until relatively recently, the agencies responsible for implementing immigration policy were underfunded, understaffed, and neglected. During the past few years, however, massive increases in resources and personnel, combined with significant political attention to immigration issues, have provided new opportunities to address long-standing problems. A recent General Accounting Office report documented improvements—including, for example, a more strategic approach to the formulation of immigration enforcement programs—but concluded that management problems remain. Further change is required if the overall U.S. immigration system is to function smoothly and effectively, anticipating and addressing, rather than reacting to, problems.

STRUCTURAL REFORM

The Commission recommends fundamental restructuring of responsibilities within the federal government to support more effective management of the core functions of the immigration system: border and interior enforcement;

The Commission recommends fundamental restructuring of responsibilities within the federal government to support more effective management of the core functions of the immigration system: border and interior enforcement, enforcement of immigration-related employment standards, adjudication of immigration and naturalization applications, and appeals of administrative decisions.

*enforcement of immigration-related employment standards; adjudication of immigration and naturalization applications; and appeals of administrative decisions***.** The immigration system is one of the most complicated in the federal government bureaucracy. In some cases, one agency has multiple, and sometimes conflicting, operational responsibilities. In other cases, multiple agencies have responsibility for elements of the same functions. Both situations create problems.

Mission overload. Some of the agencies that implement the immigration laws have so many responsibilities that they have proved unable to manage all of them effectively. Between congressional mandates and administrative determinations, these agencies must give equal weight to more priorities than any one agency can handle. Such a system is set up for failure, and, with such failure, further loss of public confidence in the immigration system.

No one agency is likely to have the capacity to accomplish all of the goals of immigration policy equally well. Immigration law enforcement requires staffing, training, resources, and a work culture that differs from what is required for effective adjudication of benefits or labor standards regulation of U.S. businesses. While some argue that enforcement and benefits are complementary functions, we agree with the Commission for the Study of International Migration and Cooperative Economic Development [Asencio Commission, after its Chair] that placing incompatible service and enforcement functions within one agency creates problems: competition for resources; lack of coordination and cooperation; and personnel practices that both encourage transfer between enforcement and service positions and create confusion regarding mission and responsibilities. Combining responsibility for enforcement and benefits also blurs the distinction between illegal migration and legal admissions. As a matter of public policy, it is important to maintain a bright line between these two forms of entry. We believe the Asencio Commission was correct in contending that separating enforcement and benefits functions

will lead to cost efficiencies, more effective enforcement, and improved service to the public.

Diffusion of responsibilities among agencies. Responsibility for many immigration functions are spread across numerous agencies within single departments or between departments. This fragmentation of responsibility is most clear in relationship to the adjudication of applications for admission as a legal permanent resident: responsibility for making decisions on skill-based immigrant and LDA applications is dispersed among the Department of Labor, the Department of Justice's Immigration and Naturalization Service and the Department of State. Responsibility for investigating employer compliance with immigration-related labor standards is shared by INS and DOL. Additionally, the United States Information Agency has responsibility for determining who will enter with a J visa, under which some exchange visitors work in this country. USIA also must sign off on requests for waivers of the two-year home residency required of some J visa holders before they can adjust their status to other nonimmigrant or immigrant categories.

A second area in which responsibility is diffused and activities are redundant is worksite enforcement. Both INS and DOL conduct investigations to determine if employers have violated the employment eligibility verification requirement. Sanctions may be imposed by INS against employers who knowingly hire unauthorized workers. The DOJ Office of Special Counsel has related responsibilities in determining if employers are engaging in immigration-related unfair employment practices.

Fragmentation of responsibility leads to conflicting messages from the various agencies, unnecessary delays in adjudication, and, when more than one agency must adjudicate the same request, redundancies in actual implementation.

Current U.S. Immigration System

AGENCY \ FUNCTION	IMMIGRATION ENFORCEMENT	IMMIGRATION BENEFITS	LABOR STANDARDS	APPEALS
DEPARTMENT OF JUSTICE				
Immigration & Naturalization Service	✓	✓	✓	✓
Executive Office for Immigration Review				✓
DEPARTMENT OF STATE				
Consular Affairs		✓		
Bureau for Population, Refugees & Migration		✓		
Board of Appellate Review*				✓
DEPARTMENT OF LABOR				
Employment Standards Administration			✓	
Employment Training Administration		✓		
Board of Alien Labor Certification Appeals				✓

*For a limited set of nationality- and citizenship-related matters.

The Commission considered a range of ways to reorganize roles and responsibilities, including proposals to establish a Cabinet-level Department of Immigration Affairs or an independent agency along the lines of the Environmental Protection Agency. We believe a new department or independent agency is neither practical nor desirable, particularly in the context of current interest in streamlining government operations, not creating sizeable, new entities.

After examining the full range of options, the Commission con-

Proposed
U.S. Immigration System

AGENCY \ FUNCTION	IMMIGRATION ENFORCEMENT	IMMIGRATION BENEFITS	LABOR STANDARDS	APPEALS
DEPARTMENT OF JUSTICE Bureau for Immigration Enforcement	✓			
DEPARTMENT OF STATE Undersecretary for Citizenship, Immigration, and Refugee Admissions		✓		
DEPARTMENT OF LABOR Employment Standards Administration			✓	
AGENCY FOR IMMIGRATION REVIEW				✓

cludes that a clear division of responsibility among existing federal agencies, with appropriate consolidation of functions, will improve management of the federal immigration system. As discussed below, *the Commission recommends a restructuring of the immigration's four principal operations as follows:*[1]

1. ***Immigration enforcement at the border and in the interior of the U.S in a new Bureau for Immigration Enforcement at the Department of Justice;***

2. ***Adjudication of eligibility for immigration-related applications (immigrant, limited duration admission, asylum, refugee, and naturalization) in the Department of State under the jurisdiction of a new Undersecretary for Citizenship, Immigration, and Refugee Admissions;***

The Commission recommends a restructuring of the immigration system: 1. Immigration enforcement at the border and in the interior of the U.S at the Department of Justice; 2. Adjudication of eligibility for immigration-related applications in the Department of State; 3. Enforcement of immigration-related employment standards in the Department of Labor; and 4. Appeals of administrative decisions in an independent review agency.

Proposed Restructuring of the Immigration System

DEPARTMENT OF JUSTICE	DEPARTMENT OF STATE	DEPARTMENT OF LABOR	INDEPEN DENT AGENCY
BUREAU FOR IMMIGRATION ENFORCEMENT	UNDERSECRETARY FOR CITIZENSHIP, IMMIGRATION, AND REFUGEE ADMISSIONS	EMPLOYMENT STANDARDS ADMINISTRATION	AGENCY FOR IMMIGRATION REVIEW
Immigration enforcement at the border and in the interior of the United States	Adjudication of eligibility for immigration-related applications	Enforcement of immigration-related employment standards	Administrative review of all authorized immigration-related appeals

3. ***Enforcement of immigration-related employment standards in the Department of Labor; and***

4. ***Appeals of administrative decisions, including exclusion, deportation, and removal hearings, in an independent agency, the Agency for Immigration Review.***

The Commission believes this streamlining and reconfiguring of responsibilities will help ensure: coherence and consistency in immigration-related law enforcement; a supportive environment for adjudication of applications for immigration, refugee, and citizenship services; rigorous enforcement of immigration-related labor standards to protect U.S. workers; and fair and impartial review of immigration decisions.

Bureau for Immigration Enforcement (DOJ)

The Commission recommends placing all responsibility for enforcing United States immigration laws to deter future illegal entry and ***remove illegal aliens in a Bureau for Immigration Enforcement in the Department of Justice.*** The Commission believes that the importance and complexity of the enforcement function within the U.S. immigration system necessitate the establishment of a higher-level, single-focus agency within the DOJ. The Commission further recommends that the newly configured agency have the prominence and visibility that the Federal Bureau of Investigation [FBI] currently enjoys within the DOJ structure. The Director of the Bureau for Immigration Enforcement would be appointed for a set term (e.g., five years). The agency would be responsible for planning, implementing, managing and evaluating all U.S. immigration enforcement activities both within the United States and overseas.

The Commission recommends placing all responsibility for enforcing United States immigration laws to deter future illegal entry and remove illegal aliens in a Bureau for Immigration Enforcement in the Department of Justice.

[1] See Appendix for Commissioner Leiden's concurring statement.

The new agency's responsibilities would include many functions currently performed by the INS: inspections and admissions at air, land, and sea ports of entry and at pre-inspection facilities overseas; border management and control between ports of entry; apprehension and prosecution and removal of illegal residents and workers; oversight of pre- and post-trial/hearing release; identification and prosecution of document fraud; identification, deterrence, and prosecution of alien smuggling gangs; and other domestic and overseas deterrence activities.

The Commission believes that the current U.S. immigration system structure diffuses and confuses potential for a more concerted focus on central functions and activities. Enforcement objectives sometimes conflict with service goals and *vice versa*. Often, both compete for limited operational resources and for the time and attention of those responsible for planning, administering, and managing these programs.

The Commission is particularly concerned that although the current removal system produces more than 100,000 final removal orders each year, the system does not have the corresponding capability to remove the individuals subject to those orders. The Commission believes that it is critical to the credibility of the removal sector of the enforcement system that the agency be held accountable for setting realistic numerical priorities and producing specific outcomes. Upper-level management must be responsible for effecting an integrated system such that the agency apprehends, detains, and proceeds against those aliens it prioritizes for removal, and ultimately removes all those being issued final orders of removal.

To establish such an integrated system, the Commission recommends that the new enforcement agency have a more traditional law enforcement model structure and that it focus on police activities, pre- and post-trial probation services, and prosecution. Agency person-

nel should be upgraded to receive pay and benefits commensurate with those provided to other Department of Justice law enforcement agents. At present INS personnel performing the same functions as FBI or Drug Enforcement Agency [DEA] personnel are often at a lower-pay grade.

The police function would be carried out by *uniformed services,* such as Inspectors and Border Patrol Agents, and *investigators* who would conduct investigations and collect intelligence at the border and in the interior to deter smuggling, facilitate removals, and accomplish other similar goals. The Commission suggests turning over most detention responsibility to the U.S. Marshals Service and/or the Bureau of Prisons.

As in other law enforcement operations, particularly those in which more people are put into proceedings than can either be accommodated in detention or actually removed, there is a need for *pre- and post-trial/hearing screening* and/or *supervised release* on probation or bond. In the immigration context, these could be available, for example, to asylum-seekers who are deemed by an Asylum Officer to have demonstrated a credible fear of persecution, to those who have accepted voluntary departure and posted bond, or to those unlikely (because of close family members or other strong community ties) to abscond pending completion of their hearings or sentences.

To ensure a high expectation of individuals actually being removed from the U.S. within a certain time, the Commission believes that Trial Attorneys should have greater discretion to set priorities for apprehension and prosecution and to determine which cases are pursued for removal proceedings.

The Commission recommends the following distribution of responsibilities within the Bureau for Immigration Enforcement.

Uniformed enforcement officers. The Commission recommends merger of the INS Inspectors, Border Patrol, and detention officers into one unit, the Immigration Uniformed Service Branch. Its officers would be trained for duties at land, sea, and air ports of entry, between land ports on the border, and in the interior where uniformed officers are needed for enforcement. The unit would be accountable for both the facilitation of legal traffic at the ports of entry and the enforcement against illegal entry. It also would be responsible for moving detainees from apprehension sites to detention facilities and to hearing sites, as well as for escort duty during removals. After appropriate training, most of the officers performing these various functions could be transferred interchangeably, and opportunity for job mobility would exist across lines not now possible. As stated above, grade level and pay should be upgraded as needed to be commensurate with the law enforcement activities the officers will perform.

Unlike the current practice in which the Border Patrol reports to Sector Chiefs and Inspectors report to District Directors, all uniformed officers within a particular geographic area would be under the authority of a single, integrated immigration enforcement manager.

Investigators. The Commission believes investigations will be a key part of the new agency's responsibility. Investigators are the main agents responsible for identifying and apprehending people who are illegally residing or working in the United States, for deterring smuggling operations, for building a case against those who are not deterred, and for identifying, apprehending, and carrying out the removal of aliens with final orders of removal.

Only some 2,900 employees, out of an INS staff of more than 25,000, work on these many investigative tasks. A similar number work in INS Detention and Deportation. Most of these Deportation Officers

could—given additional on-the-job training and supervision conduct investigations. Deportation Officers now deal almost exclusively with docket control and management paperwork that could be done by lower level support staff, freeing the Deportation Officers for field work.

INS Investigators primarily work the front end of the removals process: identifying and arresting those who are illegally residing or working in the U.S. Little attention is given to the removal process as a whole, for ensuring availability of adequate detention space, allocating ample Trial Attorney and Immigration Judge time, effecting transfer to airports, and achieving physical removal. The system is bogged down with increasing numbers of aliens who are apprehended, charged with an immigration violation, put into proceedings, released due to lack of detention space or other prerequisites for effective timely processing, never appear at their hearings, or are never deported after a final order of removal is issued. The failure of careful planning and integration of the process means many of those who are apprehended are never removed. According to some observers, the INS' compartmentalized program planning, budgeting, and implementation procedures blunt attempts to integrate these functions more fully into a seamless and effective process.

"Removal Officers" in the new Bureau for Immigration Enforcement, who would integrate the functions of Investigators and Deportation Officers in apprehensions and removals, would enable the immigration system to deliver better on its commitment to actually remove those who are issued final orders. Managers would then have the flexibility to shift resources among various investigations activities as needed to produce a smooth-flowing process that ensures timely removal. As dsicussed above, grade and pay should be commensurate with the often dangerous law enforcement duties performed by investigators.

Intelligence. The Bureau for Immigration Enforcement will require an Intelligence Division to provide strategic assessments, training and expertise on fraud, information about smuggling networks, and tactical support to uniformed officers or investigators. It would act as a liaison with other federal law enforcement agencies and share information and intelligence. The Intelligence division would be one of the smallest in the agency with an anticipated staff of about 100 employees.

Assets Forfeiture Unit. As with the other DOJ enforcement agencies, the Bureau would have an Assets Forfeiture Unit. Statutory authority for Assets Forfeiture activities is a useful addition to the range of strategies and sanctions available to the U.S. law enforcement community. Augmented authorities in the 1996 immigration legislation increased both its usefulness and the potential for misuse or abuse. In order to be aggressive in using these new authorities and equally aggressive and proactive in ensuring against misuse/abuse, DOJ agencies established assets forfeiture units under the general guidance of the DOJ Assets Forfeiture Unit. Each agency, including FBI, DEA, and INS, has its own unit. These units, usually highly-placed within the agency, are the focal points for agency-wide asset-related policy implementation, field staff training, and field operations monitoring. They assist the agency's field staff in case development, monitor use of assets forfeiture funds, and oversee use of these sanctions to guard against abuse.

Pre- and post-trial "Probation" Officers. "Probation" functions are not now performed consistently or effectively in the immigration system, but the Commission believes these functions are essential to more strategic use of detention space. District Directors and Immigration Judges determine the release (either on personal recognizance or on bond) of apprehended aliens from detention. Often, release relates more to lack of detention space than to the likelihood that aliens will appear at their proceedings or assessment of aliens' danger to the community. Some aliens are given the option to

depart voluntarily, but there is little tracking of whether they actually leave the country. As it is unlikely that all potentially deportable aliens could or should be detained awaiting removal, the Commission believes more attention should be given to supervised release programs and to sophisticated methods for tracking the whereabouts of those not detained.

Pilot programs, such as the Vera Institute Appearance Assistance Program discussed above, could be expanded into more areas if successful. INS requested this three-year project in the New York area. It studies reporting requirements and the effectiveness of community sponsors in supervising the release of aliens who meet certain criteria regarding community ties, relief from removal, and public safety. The program aims to free up valuable detention space for aliens without legal remedies who are likely to abscond, while keeping those who might receive relief out of detention.

Trial Attorneys/Prosecutors. INS has nearly 800 staff involved in immigration-related legal proceedings, such as offering legalopinions and advice and representing the government's interests in proceedings before Immigration Judges and on appeal.

The Commission believes that the Trial Attorneys, who, in effect, are the Government's immigration prosecutors, should be vested with, *and should utilize*, an important tool possessed by their criminal counterparts: prosecutorial discretion. Under the current system, the Trial Attorneys do not as a practice use discretion in determining which cases to pursue. The INS does not sufficiently prioritize or target cases; instead it acts as if it had the means to prosecute each and every case effectively. Cases go forward, even when an alien will, or is likely to, prevail on an application for relief or when there is no realistic belief that the alien will ever be removed from the country. Discretion exercised at the beginning of the process and at every step would target the use of scarce resources better and contribute to a more effective and credible system. Central office lead-

ership would be required to set appropriate priorities and provide guidance to the Trial Attorneys as to the proper use of discretion.

Greater sharing of information between the Trial Attorneys, aliens, and their counsels would facilitate smoother and more expeditious movement through the system and fewer Freedom of Information Act requests. Greater use of stipulations and pretrial conferences (with sanctions resulting when attorneys are not prepared), would narrow the disputed issues needing court resolution and time.

Field Offices. The new enforcement agency would implement its programs through a series of field offices structured to address comprehensively the immigration enforcement challenges of the particular locality As the location of these offices should be driven by enforcement priorities, they would likely be located in different places than current district offices. Regional Offices could be retained for administrative and managerial oversight of these dispersed and diverse field offices. The field office inspections officers at ports of entry would both facilitate the admission of legal limited duration admissions and immigrants and the identification of illegal entrants. Border Patrol stations along the border and at checkpoints along major interior transportation corridors would facilitate enforcement activities. Appropriate field offices also would investigate and prosecute cases and contribute to detection and destruction of smuggling rings.

Current INS Regional Offices could be retained for administrative and managerial oversight of these dispersed and diverse field offices. Most existing district offices and suboffices could be incorporated into the new agency; they also could supervise and administer the Border Patrol. [Until the mid-1950s, Border Patrol units worked out of and reported to INS District Offices.] The INS overseas enforcement presence could be retained and expanded by the new enforcement agency.

Citizenship, Immigration, and Refugee Admissions (DOS)

The Commission recommends that all citizenship and immigration benefits adjudications be consolidated in the Department of State, and that an Undersecretary for Citizenship, Immigration, and Refugee Admissions be created to manage these activities. At present, three separate agencies—the INS, the Department of State, and the Department of Labor—play broad roles adjudicating applications for legal immigration, limited duration admission, refugee admission, asylum, and/or citizenship. In addition, the Department of Health and Human Services plays an ancillary role in setting requirements regarding health standards for new arrivals, and the United States Information Agency has a major role in exchange visitor programs.

The Commission recommends that all citizenship and immigration benefits adjudications be consolidated in the Department of State, and that an Undersecretary for Citizenship, Immigration, and Refugee Admissions be created to manage *these activities.*

The Commission believes a more streamlined and accountable adjudication process, involving fewer agencies but greater safeguards, would result in faster and better determinations of these benefits. Consolidation of responsibility in one department would permit a reengineering of the adjudication process to make it more efficient and timely.

In considering which department should be responsible for adjudicating citizenship and immigration benefits, the Commission considered each agency's current role and overall mission. Immigration has been a stepchild in each of the major departments with current responsibilities. The Department of State's primary role is the conduct of foreign relations, and immigration issues have been subsumed within its consular functions of protection and welfare of American citizens abroad. The Department of Justice tends to view immigration as an enforcement matter, and it is not well suited to oversee an agency that also adjudicates applications for benefits. The Department of Labor is concerned primarily with the labor market impact of immigration. The Department of Health and

Human Services plays an important role in setting and implementing domestic refugee policy, but it has a very narrow, largely health-related involvement in overall immigration policy.

Recognizing the drawbacks inherent in choosing any of these locations, the Commission nevertheless concluded that the Department of State has the greatest capacity to undertake the additional work entailed in a consolidated system.

Taking responsibility for immigration and citizenship services out of the Department of Justice sends the right message, that legal immigration and naturalization are not principally law enforcement problems; they are opportunities for the nation as long as the services are properly regulated. Further, the Department of Justice does not have the capacity internationally to take on the many duties of the Department of State. The Department of State, however, already has a domestic presence and an adjudicatory capability. It issues one-half million immigrant visas and six million nonimmigrant visas each year. DOS also provides a full range of citizenship services both domestically (issuance of almost six million passports annually) and abroad (e.g., citizenship determinations and registration of births of U.S. citizens overseas). Indeed, DOS has devoted a major share of its personnel and its capital and operating resources to these adjudicatory functions at embassies and consulates in more than two hundred countries and in passport offices in fifteen U.S. cities. In addition, the National Visa Center in New Hampshire processes and forwards to overseas posts three-quarters of a million immigrant cases.

Consolidating responsibility requires some changes in the way the Department of State administers its immigration responsibilities, which we believe would strengthen the adjudication function. This increase in domestic responsibilities may raise concern over possible decrease in attention and focus on the Department of State's tradi-

tional mandate in foreign affairs, as well as more practical caution regarding the well-known difficulties in managing the domestic aspects of immigration. Some observers also may be concerned that DOS might not give sufficient consideration to the domestic impact of immigration. To counter this perception (and some underlying reality), the Department of State would need to develop mechanisms for consultation with domestic groups representing a broad range of views and interests regarding immigration.

The Department of State also will need to change its historic position on review of consular decisions. At present, decisions made at INS and the Department of Labor on many immigrant and LDA applications may be appealed, but no appeal is available on consular decisions. The Commission believes that immigrant and certain limited duration admission visas with a U.S. petitioner should be subject to independent administrative review [see below]. The Department of State also would have to prepare its own bureaucracy to take on these new functions. A need for a renewed emphasis on training for the management of large and interrelated offices and processes will be matched by the need for superior personnel management and leadership. These highly-regarded management skills would be an ideal attraction for those Foreign Service officers who shy away from consular assignments abroad, perceiving them as unwanted digressions from the classic diplomatic career path.

The new organization would be responsible for naturalization and determination of citizenship, adjudication of all immigrant and limited duration admission petitions, work authorizations and other related permits, and adjustments of status. It also would have responsibility for refugee status determinations abroad and asylum claims at home. Overseas citizenship services would continue to be provided by consular officers abroad and in Washington. Policy and program development for all immigration activities would be incorporated into the new organization, which also would have

enhanced capacity to detect, deter, and combat fraud and abuse among those applying for benefits.

With consolidation, the Department of State would have sole responsibility for processing immigrants—from the filing of the petition in the United States and subsequent visa issuance abroad, to the production of the green card and work authorization in the U.S., and ultimately, to naturalization. Issuance of a passport to the newly-naturalized citizen would complete this almost seamless process of immigration benefits adjudications. Consolidation of these steps would permit greater operational flexibility (e.g., one-stop adjudication of petitions and forwarding to posts abroad, streamlined processing for work-related visas), greater flexibility in use of personnel (e.g., the examination function could span visa petitions and passports), and, as discussed below, greatly enhanced antifraud capabilities.

The consolidation of these functions in DOS would, of course, be a major undertaking for a relatively small department already charged with absorbing the United States Information Agency and the Arms Control and Disarmament Agency. The Department of State must be given the resources to fulfill such new responsibilities. The approximately five thousand INS and Department of Labor staff currently involved in immigration applications adjudications would likely be transferred to DOS. Many employees would remain in or near their present locations and their functions would not appreciably change.

This recommendation envisions creation of an Undersecretary who would have direct access to the Secretary of State and who would be responsible for domestic and overseas immigration, citizenship, and refugee functions.

Within the Office of the Undersecretary would be a unit responsible both for formulating and assessing immigration policy as well as

reviewing and commenting on the immigration-related effects of foreign policy decisions. This policy capacity would be new for the Department of State, but it is in keeping with the important role that migration now plays in international relations.

The Undersecretary would have three principal operating bureaus:

A Bureau of Immigration Affairs [IA] would focus on the immigration process, as noted above, as well as on LDA processing. IA's expanded responsibilities would be based on those currently assigned to the Visa Office and the National Visa Center. In addition to its existing overseas work, the Bureau of Immigration Affairs would be responsible for domestic adjudication/examination functions, including work authorization, adjustment of status, domestic interviewing, and the issuance of appropriate documentation (e.g., green cards). The Bureau of Immigration Affairs also would staff immigration information and adjudication offices in areas with immigrant concentrations. Related INS legal and regulatory staffs in Washington also would transfer to the IA Bureau, as would DOL functions regarding employment-based entry. In short, the IA Bureau would assess—in the U.S. and abroad—applications for all immigration-related benefits now performed by INS, DOL, DOS, and USIA.

Importantly, the employment verification system outlined in previous Commission recommendations also would be under the Department of State's control, although it would likely contract out the actual operation of that system. Another important part of its domestic presence would be the staffing of immigration information offices in areas of major immigrant concentrations.

A Bureau of Refugee Admissions and Asylum Affairs would assure an appropriate level of independence from routine immigration issues and processes. It would combine the present Bureau for Population, Refugees and Migration [PRM] responsibilities for over-

seas refugee admissions, the refugee and asylum offices of the INS, and the DOS asylum office in the Bureau of Democracy, Human Rights and Labor.[2] This would integrate the key governmental players in one of our most important and historic international activities. In this vein, the direct line of authority to the Secretary of State through the new Undersecretary underlines the key policy advantage for global refugee issues.

A Bureau of Citizenship and Passport Affairs would be responsible for naturalization, other determinations of citizenship, and issuance of passports. Local offices performing some citizenship functions, such as overseas travel information, passport and naturalization applications, testing and interviews, could be located at the new or expanded immigration offices noted below.

Overseas citizen services would continue to be handled within the new consolidated organization, utilizing the DOS substantial domestic and overseas staff. These services include: responding to inquiries as to the welfare or whereabouts of U.S. citizens; assisting when U.S. citizens die, are arrested, or experience other emergencies abroad; providing notarial services; and making citizenship determinations and issuing passports abroad. In some countries experiencing instability, an increasingly important activity is organizing Americans living or working in those areas into networks for efficient communication of information and warnings.

Quality Assurance Offices would oversee records management, monitoring procedures, fraud investigations, and internal review. At present, monitoring of the quality of decisions made on applica-

---

[2] The Commission makes no recommendation regarding the management or organization of the overseas refugee and humanitarian assistance programs operated by PRM and the USAID Bureau for Humanitarian Response. These functions could remain within the Undersecretary for Global Affairs or be brought under the new Undersecretary for Citizenship, Immigration, and Refugee Admissions.

tions for immigration and citizenship benefits receives insufficient attention. INS enforcement officials now have the responsibility to investigate allegations of fraud in immigration and naturalization benefits programs, but monitoring the adjudications process is a low priority in an office that is also responsible for identifying and removing criminal aliens, breaking up smuggling and counterfeiting rings, and performing similar police work. A staff responsible for and dedicated to ensuring the quality of decisions taken on applications for immigration and citizenship should address some of the weaknesses, such as those recently identified in the naturalization process.

Some adjudication decisions now are reviewed by a separate administrative unit within the agency conferring benefits; others are not. The Commission believes that quality decisions require some form of supervisory review for applicants who believe their cases have been wrongly decided. This type of review helps an agency monitor consistency and identify problems in adjudication and offers a means of correcting errors. At present, DOS has procedures for some internal supervisory review of consular decisions, but it has had no need for procedures to review refusals of applications at earlier stages of adjudication. With expanded responsibilities, DOS will need to develop a comprehensive internal review process that ensures that errors are corrected with minimal disruption to the applicant and the agency.

Quality assurance requires good records. The accrued personal records of each immigrant must be accurate, up-to-date, and retrievable at each adjudicative stage: (1) petition/immigrant visa; (2) alien resident/green card; (3) naturalization; and (4) passport. The creation and maintenance of the alien filing system ("A" files) should be reviewed to assure its maximum utility in the adjudicative flow noted above. The absolute need for good immigration records cannot be overstated.

Standardized and flexible records management and the consolidation of domestic and overseas adjudication functions will greatly enhance antifraud capabilities. At present, fraud often is not discovered until after a government agency has given the case one or more approvals and the alien appears for his or her visa. The resources are not now in place for adequate review of questionable petitions, and communications between overseas posts and domestic agencies are not adequate. Even when they receive information from overseas posts about likely fraud, the domestic agencies generally do not follow up with further investigation. Consolidation within the Department of State would overcome poor coordination and communication and permit more antifraud efforts at the beginning of the process, where they are most effective. A fraudulent entry prevented, a work permit not issued to an unauthorized person, or an ineligible alien prevented from naturalization—these are far more preferable to trying to rescind a benefit granted in error.

With respect to the domestic field structure for implementing these programs, The Regional Service Centers and National Visa Center would continue to be the location of most adjudication. The physical plants are excellent and the locally-hired staffs are trained and in place. At this time, information is passed from the RSCs to the NVC when the applicant for admission is overseas. Eventually, however, the functions of the Service Centers and the Visa Center might be consolidated. Overseas interviews would continue to take place at embassies and consulates.

A range of other interviews would take place domestically. The Department of State already operates fifteen passport offices throughout the United States, many in areas of high immigrant settlement. These offices, however, are not set up for high volume interviewing. New offices, designed specifically with immigrant services in mind, would be needed. Ideally, to avoid long lines and waits for service, there would be smaller offices in more locations than the current INS district offices. The Commission recommends against locating

these offices with the enforcement offices discussed above. Asking individuals requesting benefits or information to go to an enforcement agency sends the wrong message about the U.S. view of legal immigration.

Immigration-Related Employment Standards (DOL)

The Commission recommends that all responsibility for enforcement of immigration-related standards for employers be consolidated in the Department of Labor. These activities include enforcing compliance with requirements to verify work authorization and attestations made regarding conditions for legal hire of temporary and permanent foreign workers. The Commission believes that as this is an issue of labor standards, the Department of Labor is the best equipped federal agency to regulate and investigate *employer compliance* with standards intended to protect U.S. workers. The hiring of unauthorized workers and the failure of employers to comply with the commitments they make (e.g., to pay prevailing wages, to have recruited U.S. workers) in obtaining legal permission to hire temporary and permanent foreign workers are violations of such labor standards. Responsibility for enforcing compliance with these requirements currently lies within both INS and DOL. Under consolidation, the DOL Employment Standards Administration's [ESA], Wage and Hour Division [WH] and Office of Federal Contract Compliance Programs [OFCCP] would perform these functions in conjunction with their other worksite labor standards activities.

The Commission recommends that all responsibility for enforcement of immigration-related standards for employers be consolidated in the Department of Labor.

These increased immigration-related responsibilities would require increased DOL staff and resources. In addition to performing all worksite inspections, DOL would assume new employer sanctions responsibilities. Specifically, the Commission makes the following recommendations regarding the DOL role in regulating the worksite to ensure the protection of U.S. workers.

Sanctions against employers who fail to verify work authorization. Among its provisions that address the problem of unauthorized immigration, the Immigration Reform and Control Act of 1986 made it unlawful for an employer knowingly to hire any alien not authorized to work in the U.S. IRCA requires all employers to check the identity and work eligibility documents of all workers hired. Upon hiring, employees must sign an I-9 Form certifying eligibility to work and that the documents they present to the employer are genuine. The employer then signs the form, indicates which documents were presented, and attests that they appear to be genuine and to relate to the individual who was hired. IRCA established penalties both for employers failing to comply with this process and for employers knowingly hiring unauthorized aliens. Pilot testing of a more rigorous verification process recommended in the Commission's 1994 report and adopted in large part in the immigrant legislation passed in 1996 addresses verification problems arising from the widespread use of fraudulent documents by illegal aliens.

The Commission believes all worksite investigations to ascertain employers' compliance with employment eligibility verification requirements should be conducted by the Department of Labor. Although DOL already conducts many of these investigations, under this recommendation, DOL also would assess penalties if employers fail to verify the employment eligibility of persons being hired. DOL would not be required to prove that an employer knowingly hired an illegal worker, just that the employer hired a worker without verification of his or her authorization to work. With implementation of the Commission's proposal for a more effective verification process, this function will be critical to deterring the employment of unauthorized workers.

At present, INS has the principal responsibility for employers sanctions enforcement, including: investigations and prosecution of "knowing hires" of illegal aliens and paperwork violations; worksite

raids that apprehend and remove illegal aliens; and development and maintenance of employee eligibility verification programs designed to help employers determine which individuals are authorized to work in the United States. DOL also reviews employer compliance with the employer sanctions verification processes in the course of its on-site visits to workplaces and as part of regular labor standards enforcement activities. DOL Wage and Hour and OFCCP personnel inspect the I-9 Forms on file and notify INS of the results of such inspections. DOL also is authorized to issue warning notices to employers when deficiencies are found in an employer's verification process. In practice, however, DOL has rarely issued such warnings.

Although INS and DOL jointly enforce the employer sanctions provisions, INS has the primary responsibility, including assessing civil penalties and initiating legal action. A Memorandum of Understanding between DOL and INS retains for INS the responsibility for promulgating employer sanctions program policy.

Consolidating verification enforcement at DOL gives responsibility to an agency with extensive experience regulating business compliance with labor standards, an expertise largely lacking at INS. It also permits a relatively high level of enforcement activity, as DOL completes far more employer visits than INS. The number of employer sanctions cases completed by INS has decreased sharply from 14,311 in 1990 to 5,211 in FY 1996, of which 90 percent were cases in which the agency had some reason to believe a violation occurred.[3] Over the past several years, the number of Wage and Hour on-site investigations also has decreased substantially but is still well above the INS level. The DOL reduction results largely from

[3] The lowered activity, nevertheless, represents more targeted and effective enforcement. The number of arrests during this same period increased more than 50 percent. In 1,024 cases the employers were fined; warnings were issued in 669 cases; $4,853,288 was collected in fines; and 13,848 undocumented workers were arrested.

a greatly expanded use of expedited investigations in the form of employer self-audits and conciliations in place of on-site investigations. For example, Wage and Hour conducted more than 42,000 on-site investigations and corresponding I-9 inspections in FY 1990, but less than 23,000 in FY 1996. OFCCP conducts some 4,000 on-site inspections each year. In FY 1996, approximately 70 percent of Wage and Hour investigations were complaint-driven; the remaining 30 percent were directed or targeted. Wage and Hour devotes the equivalent of twenty-one full-time employees to I-9 inspections, OFCCP the equivalent of eight.

The Commission recognizes DOL concern that from the begining its assumption of an employer sanctions enforcement role created a potential conflict with its broader mission of protecting the wages and working conditions of workers. Its inspectors worry that workers' fears that such employer sanction actions might result in INS apprehension and deportation could have a "chilling effect" on those workers who might—and should—come forward to report workplace abuses. For this reason, DOL has been extremely wary of crossing the hard-to-distinguish line where sanctions-related activities might effectively frustrate its ability to protect deserving workers.

The Commission believes that DOL participation in verifying that only authorized workers are hired should be seen as integral to its mission of protecting U.S. workers. DOL has an essential interest in reducing illegal migration as those employers who hire illegal aliens are more likely to violate the minimum labor standards that DOL is charged with enforcing. A reduction in levels of illegal migration could well be the most effective tool available to enhance protections for legally authorized workers. The primary responsibility of DOL is protecting American workers, and transfer of employer sanctions enforcement to DOL represents the best option for raising the level of enforcement to a point that presents a real deterrent to the employment of undocumented workers.

Enforcement of skill-based immigrant and limited duration **admissions requirements.** In our 1995 report to Congress, the Commission urged adoption of streamlined procedures for the admission of skilled foreign workers whom U.S. businesses wish to hire. We continue to believe that an expedited process is needed for the admission of both temporary and permanent foreign workers, as discussed earlier in this report, as long as adequate safeguards are in place to protect the wages and working conditions of U.S. workers. To prevent abuse of an expedited system, an effective postadmissions enforcement scheme is necessary.

Upon adoption of an expedited process for the admission of both immigrant and temporary workers, DOL should be given responsibility and resources for enhanced monitoring of employers' fulfillment of the attestation terms they filed to bring in workers. As discussed above, decisions on who will be admitted under the various skill-based admission categories would be made by the Department of State.

DOL's other worksite enforcement responsibilities place it in the best position to monitor employers' compliance with the attestations submitted in the admissions process. DOL investigators are experienced in examining employment records and interviewing employees. Penalties should be established for violations of the conditions to which the employer has attested, including payment of the appropriate wages and benefits, terms and conditions of employment, or any misrepresentation or material omissions in the attestation. Such penalties should include both the assessment of administrative fines as well as barring egregious or repeat violators from petitioning for the admission of permanent or temporary workers.

When DOL has concluded that an employer is an egregious or repeat violator, and any subsequent administrative appeal has been decided, it would notify the DOS Bureau of Immigration Affairs of such findings, with a recommendation about barring the employer

from petitioning for the admission of foreign workers for temporary or permanent employment. The Bureau of Immigration Affairs would then determine if such a debarment is to be made and would notify the employer of its decision. The employer would have the option of appealing such a decision.

The Commission recommends that administrative review of all immigration-related decisions be consolidated and be considered by a newly-created independent agency, the Agency for Immigration Review, within the Executive Branch.

Agency for Immigration Review

The Commission recommends that administrative review of all immigration-related decisions be consolidated and be considered by a newly-created independent agency, the Agency for Immigration Review, within the Executive Branch.

The Commission believes that a system of formal administrative review of immigration-related decisions—following internal supervisory review within the initial adjudicating agency—is indispensable to the integrity and operation of the immigration system. Such review guards against incorrect and arbitrary decisions and promotes fairness, accountability, legal integrity, uniform legal interpretations, and consistency in the application of the law in individual cases and across the system as a whole.

Experience teaches that the review function works best when it is well insulated from the initial adjudicatory function and when it is conducted by decisionmakers entrusted with the highest degree of independence. Not only is independence in decisionmaking the hallmark of meaningful and effective review, it is also critical to the reality and the perception of fair and impartial review.

To the extent that administrative review of immigration-related decisions is authorized under current law, such review is conducted by several Boards and units located in the Departments of Justice, Labor, and State. For example, within the Department of Justice, the Executive Office for Immigration Review, a separate agency es-

tablished by regulation in 1983, oversees the system of immigration courts, as well as the Board of Immigration Appeals [BIA]. The BIA, a fifteen-member panel appointed by the Attorney General, has nationwide jurisdiction over a wide range of cases, including decisions of Immigration Judges in exclusion, deportation, and removal proceedings, and requests for relief made in those proceedings. In addition, the BIA adjudicates appeals in several other categories of cases, such as bond determinations, fines, rescission of adjustment of status, and certain family-based visa petitions.

Supplementing their normal hearing docket, Immigration Judges now conduct the final review of the "credible fear" of persecution determinations made in the admission/inspection process, as well as determinations that an alien seeking admission is not currently a lawful permanent resident, refugee, or asylee as he or she claims.

The Office of the Chief Administrative Hearing Officer [OCAHO] also is housed in EOIR and is responsible for administering the hearing process issues arising under the employer sanctions, anti-discrimination, and document fraud provisions of the Immigration and Nationality Act.

Within the Immigration and Naturalization Service there is an Administrative Appeals Office [AAO], whose component parts include the Administrative Appeals Unit [AAU] and the Legalization Appeals Unit [LAU]. Unlike the BIA, the AAO does not have a decisionmaking board. Rather, the Chief of the Unit reviews and signs off on decisions prepared by individual examiners. AAO has appellate jurisdiction over petitions and applications in no fewer than thirty-nine subject areas, among which are decisions relating to the breaching of bonds, employment-based visa petitions, adjustment of status for Indochinese refugees, petitions for Amerasian children, fiancé(e)s, orphans, temporary workers, permission to reapply for admission after deportation or exclusion, reentry permit waivers for certain grounds of excludability, certification of schools

for acceptance of foreign students, applications for refugee travel documents, claims to acquisition of citizenship abroad, applications to preserve residence abroad for naturalization purposes, various applications for certain certificates of naturalization, and applications for temporary or permanent resident status under the regular legalization, Special Agricultural Worker or Replenishment Agricultural Worker programs, and corresponding waivers of inadmissibility.

Appeals of denials of naturalization applications, however, are not considered by the AAO. Instead, review of such decisions occurs at the INS district office level and is conducted by an officer of equal or higher grade as the initial adjudicator. (If the initial decision denying the naturalization application is sustained, the alien may challenge the decision in federal district court, the court having jurisdiction over the ultimate swearing-in of successful naturalization applicants.)

In the Office of the Legal Adviser in the Department of State, there is a Board of Appellate Review [BAR] vested with jurisdiction to hear, in part, appeals of determinations of loss of nationality or expatriation, and denials, revocations, restrictions, or invalidations of passports.

In the Department of Labor, the Board of Alien Labor Certification Appeals [BALCA], created by regulation in 1987, hears appeals of denials of applications for labor certification.

When considering the appellate review function in its totality, it becomes apparent that responsibility for reviewing enforcement-related decisions rests primarily with the individual components of EOIR, while responsibility for reviewing benefit adjudication decisions is spread across several offices and agencies including the BIA, AAO, INS district offices, BALCA, and, for a more limited set of

nationality- and citizenship-related issues, the BAR at DOS. Further, Immigration Judges and the BIA have the authority to provide certain forms of relief during deportation, exclusion, and removal hearings that can result in lawful permanent resident status for aliens.

Inasmuch as the underlying benefits and enforcement functions performed by the immigration system are themselves dispersed among several Departments, it is not surprising to find that formal administrative review of decisions made in the context of performing those functions is likewise dispersed. However, in light of our recommendations that responsibility for the enforcement of the immigration laws be placed with a new Bureau for Immigration Enforcement in the Department of Justice and that all citizenship and immigration benefits adjudications be removed from the Department of Justice and instead be consolidated in the Department of State, we find that a corresponding change in the placement of responsibility for the review function is in order.

Even with the assignment of the benefits adjudication function to DOS and the enforcement function to DOJ, interrelationships will exist between eligibility for benefits and enforcement actions. Indeed, eligibility for an immigration benefit may be an avenue to relief from deportation, exclusion, or removal while certain immigration violations may present barriers to attaining legal status. For example, favorable disposition of a petition or application by the benefits agency may collaterally resolve a deportation or removal issue. Aliens in enforcement proceedings may be eligible for certain forms of relief involving the same types of legal questions arising in the context of benefits adjudication outside of proceedings—or aliens in proceedings may be foreclosed from eligibility for a benefit applied for outside of proceedings. Ultimately, however, there is a need for a uniform administrative interpretation of what the law is and how it should be applied, regardless of whether the questions arise when adjudicating an application for a benefit or resolving an

enforcement action. These considerations lead us to conclude that administrative review of all presently reviewable immigration-related decisions should be consolidated.

In deciding where the review function could best be performed, the Commission considered a number of options, including separate reviewing bodies for enforcement actions within DOJ and forbenefit determinations within DOS, placing responsibility for review entirely with EOIR, and creation of an Article I Immigration Court.

Placing the review function in its entirety with EOIR was an attractive option, particularly given EOIR's success in both insulating the review function and achieving independence of decisionmaking since its inception in 1983. At the same time, EOIR remains located in the Department of Justice, ultimately and predominantly a law enforcement agency. Further, existing procedures permit the Attorney General to reverse or modify any decision reached by the BIA. The Commission, as well as other commentators, find this practice troubling because, at a minimum, it compromises the appearance of independent decisionmaking, injects into a quasi-judicial appellate process the possibility of intervention by the highest ranking law enforcement official in the land, and, generally, can undermine the BIA's autonomy and stature. In the end, the Commission decided the EOIR option was unworkable because of the inherent difficulty of a reviewing agency in one Department rendering decisions in cases initially decided by another Department.

Instead, the Commission was persuaded by the arguments that the review function should be completely independent of the underlying enforcement and benefits adjudication functions and that the reviewing officials should not be beholden to the head of any Department. Although the desired independence could be attained by establishing an Article I Immigration Court, such a court would be part of the Judicial, rather than the Executive Branch. The overall operation of the immigration system requires flexibility and coordi-

nation of function, including the review function, by the various agencies in the Executive Branch. Given this reality, the Commission concluded that the review function should be conducted by a newly-created independent reviewing agency in the Executive Branch. To ensure that the new reviewing agency is independent and will exist permanently across Administrations, we believe it should be statutorily created. It would incorporate the activities now performed by several existing review bodies and offices, including the DOJ Executive Office for Immigration Review, the INS Administrative Appeals Office and district offices (naturalization), the DOL Board of Alien Labor Certification Appeals, and the limited set of nationality and citizenship-related matters presently considered by the DOS Board of Appellate Review. The Agency for Immigration Review also would have additional responsibilities.

Creating any decisional system or tribunal requires attention to several guiding principles. First, no system can work effectively if the personnel who form the base of the decisional pyramid are insufficient in number or deficient in skills and integrity to do the job. Second, the base of any such structure cannot be expanded either in number of its personnel or in extent of its jurisdiction beyond the capacity of the next level above to review and decide the outcome. This must be achieved within a reasonable period and with a reasonable expenditure of resources. Finally, the apex of any decisional pyramid should be relatively small. With these considerations in mind, the Commission proposes the following organization for the new independent Agency for Immigration Review.

This new reviewing agency would be headed by a Director, a presidential appointee, who would coordinate the overall work of the agency, but who would have no say in the substantive decisions reached on cases considered by any division or component within the agency. There would be a trial division headed by a Chief Immigration Judge, appointed by the Director. The Chief Judge would oversee a corps of Immigration Judges sitting in immigration

courts located around the country.[4] The Immigration Judges would hear every type of case presently falling within the jurisdiction of the now sitting Immigration Judges.

The new reviewing agency also would consider appeals of decisions by the benefits adjudication agency, using staff with legal training. Although the benefits adjudication agency will handle a wide range of applications—from tourist visas to naturalization and the issuance of passports—not all determinations will be appealable, as is the case under current law. We envision that those matters that are appealable under current law would remain appealable. The only difference is that the appeal would be lodged with and considered by the new independent Agency for Immigration Review rather than by the various reviewing offices and Boards presently located among the several Departments.

The administrative appeals division also would consider appeals from certain visa denials and visa revocations by consular officers. Under current law, such decisions are not subject to formal administrative or judicial review.

When a visa is denied, important interests are at stake. To be sure, the visa applicant is adversely affected—but more importantly at stake are the interests of the United States citizens, lawful permanent residents, employers, and businesses who have petitioned the admission of the applicant or who otherwise have an interest in having the applicant present in the United States. Given the lack of formal administrative and judicial review of consular decisions, these individuals are left with little or no recourse.

---

[4] Admittedly, currently sitting Immigration Judges perform the classic review function only to a very limited degree—for the most part they serve as initial decisionmakers in cases where aliens are placed in proceedings. Notwithstanding this circumstance, however, experience teaches that Immigration Judges should find their home in the same agency as the appellate reviewing Board, not the enforcement agency that is initiating the proceedings against the alien.

The Commission believes that consular decisions denying or revoking visas in specified visa categories, including, all immigrant visas and those LDA categories where there is a petitioner in the United States who is seeking the admission of the visa applicant, should be subject to formal administrative review. The visa applicant would have no right to appeal an adverse determination. Instead, standing to appeal a visa denial or revocation would lie only with United States petitioners, whether U.S. citizens, lawful permanent residents, or employers.

An appellate Board would sit over the trial and administrative appeals divisions of the new independent Agency for Immigration Review. This appellate Board would be the highest administrative tribunal in the land on questions and interpretations of immigration law. It would designate selected decisions as precedents for publication and distribution to the public at large. Its decisions would be binding on all officers of the Executive Branch. To ensure the greatest degree of independence, decisions by the Board would be subject to reversal or modification only as a result of judicial review by the federal courts or through congressional action. Neither the Director of the reviewing agency nor any other agency or Department head could alter, modify, or reverse a decision by the appellate Board.

The appellate Board would be headed a Chairman. Both the Chair and Vice Chair would be appointed by the President for staggered terms of at least ten years. The appellate Board would have as many Members, who would be appointed by the Chair, as needed to decide appeals in a timely manner. It would consider appeals from the categories of cases presently falling within the BIA's jurisdiction, subject to the above-noted modifications. In addition, the appellate Board could entertain appeals from decisions of the administrative appeals division in cases in which a novel or significant

legal issue were presented, or in any other case in which it was deemed necessary or appropriate.

The Office of the Chief Administrative Hearing Officer, presently housed in EOIR, would operate as a separate component in the Agency for Immigration Review and would perform the same work as is presently being conducted. Of course, the precise organizational arrangements and divisional jurisdictions could be subject to future modification following a comprehensive review by the Agency for Immigration Review of the types and volume of cases received. However, to meet the challenges presented by consolidation of all immigration-related appeals in one place, and to perform its critical mission of correctly and expeditiously resolving appeals, the new reviewing agency must be given sufficient resources and staffing.

The Commission urges the federal government to make needed reforms to improve management of the immigration system.

MANAGEMENT REFORM

The Commission urges the federal government to make needed reforms to improve management of the immigration system. While the Commission-recommended structural changes will help improve implementation of U.S. policy, certain management reforms must also be adopted if the agencies responsible for immigration matters are to be effective in performing their functions. Structural reforms will not by themselves solve some of the management problems that have persisted across Administrations in the immigration agencies.

More specifically, the Commission recommends:

- **Setting more manageable and fully-funded priorities**. The Commission urges Congress and the Executive Branch to establish and then appropriately fund a more manageable set of immigration-related priorities. By this we mean establishing fewer objectives, but also setting more integrated

priorities, more realistically-achievable short-term and long-term goals, and greater numerical specificity on expected annual outcomes to which agencies should be held accountable.

The processes by which both Congress and the Executive Branch plan and allocate resources constrain the development of a more manageable set of priorities. Currently, most immigration priorities result from Legislative/Executive interaction through a multiyear budget process. Government budgeting cycles are lengthy and complex. Agencies must work simultaneously with the budgets and reporting cycles of four fiscal years.[5] Congressional action, meanwhile, consists of the doubly bifurcated processes of authorization, followed by separate appropriations in the House of Representatives and the Senate, and then by resolution in conference.

Executive Branch departments seldom identify adequately how much money they need to accomplish the entirety of a specified goal. Nor do they do a good job of scaling back or increasing objectives depending on the resources appropriated. Within the Legislative Branch, there is little coordination among congressional committees to ensure a congruence of agreed-upon priority expectations and resources actually allocated to do the job. Consequently, transparency and accountability are not built into the system. For example, Congress is not held accountable for adding new priorities without appropriating resources to accomplish all of the specified tasks. Federal agencies are neither directly nor easily held accountable for their performance in achieving or not achieving agreed-upon results.

The Commission urges Congress and the Executive Branch to refrain from overpromising what the federal government

can accomplish in implementing immigration policy. For example, rather than defining the removal of all deportable and inadmissible aliens as the priority for removal, a goal that is presently not achievable, the federal government could define removal priorities in terms of specified numbers and categories of aliens (e.g., criminal aliens) and in terms of certain strategies. For example, a "last in, first out" strategy would remove everyone who newly enters the removal system before removing persons whose cases have been pending in backlogs for some time. This priority-setting process worked well in reforming the asylum process and could be replicated in other areas.

Priority setting must be accompanied by sufficient resources to undertake the top objectives. In the case of removals, it should include resources for Investigations, Trial Attorneys, Immigration Judges, the BIA Detention and Deportation Officers, Department of State liaisons with host countries, and such needs as vehicles, equipment, training, and support. The priority should identify the problem completely and clearly and map out which part of that problem will be solved in which of several years of the priority. And then Congress should agree and the Executive Branch should be held accountable.

- **Developing more fully the capacity for policy development, planning, monitoring, and evaluation.** In general,

[5] For example, for the second quarter [January-March] of FY 1997, federal agencies were:
- For FY 1996, completing '96 year-end statistics and reports;
- For FY 1997, continuing work on implementing '97 goals and priorities;
- For FY 1998, finalizing the President's February FY 1998 Budget Submission to the Congress and explaining/defending it at congressional committee hearings;
- For FY 1999, developing the '99 budget initiatives, priorities, and strategies to be submitted to OMB under the "Spring Plan" planning process.

the current immigration system suffers from an inability to develop, sustain, and clearly articulate long-term and short-term policymaking except in times of crisis. Often this has led to bad policymaking, poorly developed programs, inadequate policy coordination across departmental lines, and almost nonexistent program assessment and evaluation of outcomes. None of the main Executive Branch departments has developed a broad-based immigration policymaking capacity.

The most developed policymaking and coordination unit in the immigration system exists in the INS Office of Policy and Planning [OPP]. However, a majority of its eighty-five people and its $5 million personnel budget are related to statistics and other nonpolicymaking activities. Moreover, while it is important for the principal agency responsible for immigration enforcement to have its own policy and planning capability, OPP is not necessarily well positioned to advise the Department of Justice about immigration-related policy issues affecting other DOJ agencies. Further, under the Commission's proposed restructuring, it would make no sense for the agency responsible for enforcement to have lead responsibility for formulating policies related to legal immigration and naturalization or enforcement of immigration-related labor standards.

Each department with immigration-related responsibilities needs to perform a wide range of policy functions, including, but not limited to, long-range and strategic policy planning, interagency policy integration, policy review, policy coordination, priority setting, data collection and analysis, budget formulation, decisionmaking, and accountability. The Domestic Policy Council and the National Security Council, both situated in the White House can also play an important role in coordinating policy development across departments.

Informed policymaking requires systematic review of current policies and programs (which themselves should be informed by reliable and timely statistical information), development of a range of options, and analysis of the advantages and disadvantages (including costs and timeframes) of each. Further, immigration policy affects, and is affected by, a wide range of other issues of interest to the departments. For example, the DOL overall labor policy is affected by immigration as the foreign-born represent a large proportion of the growth in the labor force. As a proportion of the unskilled workforce, immigrants represent an even larger proportion and potential impact. Similarly, international migration and the foreign policy and national security interests of the United States are strongly connected.

The immigration-related policymaking capacities at the departmental level in Justice, State, and Labor tend to be *ad hoc* and understaffed. For example, the Office of the Deputy Attorney General [DAG] has two and one-half to three attorneys working on immigration-related policy and program coordination. These staff serve as a clearinghouse through which immigration-related concerns and policy matters pass from the responsible agencies (e.g., INS, EOIR, Office of Special Counsel for Immigration-Related Unfair Employment Practices, Office of Immigration Litigation) through the DAG to the Attorney General. Given the wide range of policy issues requiring department-level attention, these staff have an all but unmanageable policy portfolio. Much of their time is spent on routine oversight punctuated by crisis management, with little time left for long-range policy development or planning. The Commission believes more sustained and timely attention to immigration policy issues within and across departments will help improve both the formulation and implementation of programs.

Interagency coordination of immigration policymaking also is particularly important. The Domestic Policy Council [DPC] already plays such a role. The Commission recommends strengthening the DPC's capacity to provide policy guidance, particularly when immigration matters affect or are affected by other domestic interests. Designation of a senior focal point for immigration policy in the DPC would enhance its ability to coordinate policy development. This role would be complementary to the enhanced role the Commission recommended for the National Security Council with regard to refugee issues. The DPC and the NSC would coordinate closely when migration issues relate to U.S. foreign policy and national security interests.

More specifically, the DPC should be mandated and staffed to: oversee federal immigration policy development across departmental and agency lines; monitor the execution and impact of new legislation, policies and programs; resolve differences within the Executive Branch, focusing on those that impede the capacity of the federal government to deliver a single, coherent message about immigration policy and priorities; serve as a forum for discussion of new ideas; coordinate liaison with and the input of advocates and other nongovernmental agencies concerned with federal immigration decisionmaking; and relay the resulting recommendations to Congress and the President.

- **Improving systems of accountability.** The Commission believes strongly that staff who are responsible for immigration programs should be held accountable for the results of their activities. Systems should be developed to reward or sanction managers and staff on the basis of their performance. This requires the development of performance measures that relate to expected outcomes. For example, the Commission earlier recommended rewarding Border Pa-

trol staff for their effectiveness in deterring illegal migration rather than their prowess at apprehending illegal aliens. Similarly, managers responsible for adjudication of benefits should be rewarded if they lessen processing time for the approval of applications and, simultaneously, improve their detection of fraudulent cases. By contrast, managers who fail to meet recognized operating standards should be held accountable and be sanctioned for their noncompliance. Systems to reward innovation or sanction managers and staff on the basis of their performance also need to be developed. Too often, staff who try new approaches not only are not rewarded for their initiative, they are sanctioned by their colleagues and supervisors.

- **Recruiting and training managers.** The Commission believes improvements must be made in the recruitment and training of managers. As immigration-related agencies grow and mandated responsibilities increase or evolve, closer attention should be paid to improving the skills and managerial capacity of immigration staff at all levels to ensure more efficient and effective use of resources allocated.

  Since 1993, the immigration system has been undergoing a tremendous infusion of new resources and, since 1996, significantly augmented statutory mandates. Either change would seriously burden even the best-run agencies of the federal government. Such infusions of new resources to INS and to several other agencies burden agency administrative and management systems. INS has not added a sufficient number of experienced, proven managers to help the agency address the many challenges it faces.

  Agencies must be able to rapidly recruit, select, train, deploy, and then support new staff—and they must sustain

this expansionist capacity over several fiscal years. Most of the new staff added are entry-level, necessitating on-the-job training, mentoring, and close supervision before they can be considered fully functional in their jobs.

As new staff are added, new supervisors are needed—and they too need supervisory and management training to be successful. Supervisors usually are drawn from the ranks of the operational staff, and with increased operational responsibilities, they often are unable to be freed soon enough or long enough to attend supervisory training in a timely fashion.

In addition, major changes in the immigration statutes passed in 1996 necessitate the redrafting and repromulgation of hundreds of sections of law and regulations, hundreds of new or revised forms, and training and retraining of staff just to implement these profound changes. Agencies should consider new ways in which staff are trained to do their work: e.g., training in management by objectives, in accountability, in managerial and supervisory skills. For some agencies, the skill levels—and agency cultures—are not yet adequate to be successful in fulfilling present and expected future increased managerial and supervisory responsibilities. Both additional supervisors and new skills are urgently needed.

The infusion of new skills and culture can come from two sources: (1) in-house training and retraining of existing staff; and (2) the addition—from outside the agencies themselves—of new middle- and upper-level management staff possessing those skills and the ability to apply them quickly to the immigration settings. These two sources need not be mutually exclusive; some of both may be required.

One promising recent development is the INS' new "competency-based" assessment process for Border Patrol officer promotions to supervisor. The Border Patrol is the single immigration agency receiving the greatest number of new staff over the coming next several years. The objective is to test Border Patrol officers to predict more accurately their potential for success as future supervisors. According to INS, the main focus of the system is assessment of "thinking skills . . . the way supervisors and managers must think and react on a daily basis."[6] More than 1,000 Border Patrol officers have been tested, another 1,000 will be by the end of summer 1997, and testing of all remaining eligible Border Patrol Officers will be completed by the end of 1997.

- **Strengthening customer service orientation.** The Commission urges increased attention to instilling a customer-service ethic in staff, particularly those responsible for adjudication of applications for benefits. Repeatedly, but most recurringly regarding INS, the public complains of a lack of service from both their dollar and from the personnel charged with serving them. The horror stories are too common. Most individuals coming into contact with the immigration system have paid a fee—whether indirectly (such as at airports and the inspections users fees tacked onto their ticket prices) or directly (such as through the submission of a fee with their application for a benefit). They expect and should receive service that is customer-friendly and timely. Appli-

---

[6] The system is based on four assessments:
1. *Decisionmaking Situational Assessment*, measures thinking skills such as reasoning, decisionmaking, and problemsolving;
2. *In-basket Job Simulation*, measures administrative skills, such as planning/organizing and managing/organizing information;
3. *Managerial Writing Skills Exercise*, measures written communication skills; and
4. *Past Achievement Record*, measures personal qualities, such as leadership and flexibility.

cants should be treated courteously, records should be located with ease, and accurate information should be provided in a professional manner.

The absence of a separate career track for benefits adjudicators hampers efforts to attract and retain the best federal employees to these tasks. The structural reforms we recommend should help address this problem. Currently, many of those promoted into management positions within INS moved along the enforcement career track. Its higher-paid designations frequently make them eligible for such promotions before those who spend their careers in benefits adjudication. Benefits adjudication personnel should have a career track that promotes the best performers into positions of management and leadership and provides all employees with appropriate incentives as well as models worth emulating.

The primary currency of service is information—information that should be both accurate and timely. Daily, in many locations throughout the U.S., people seeking forms, information, status checks, and interview appointments, and reporting a change of address, requesting a copy of a form in their file, or requesting or extending employment authorization create long lines around local INS offices.

Immigration customers should not have to stand hours in a line to get information. Immigration processes should be reengineered to ensure that information is easily available at several locations and through several electronic means and, when given, is accurate. Several ways to improve access to forms and information, many electronic, already are in development. Forms increasingly are available on Information Kiosks located in high volume immigration centers; soon they will be available over the Internet. The website devel-

oped by the Department of State's Bureau of Consular Affairs makes available pertinent information on conditions throughout the world.

Customer-service personnel should be both initially well-trained and periodically tested to ensure they remain current with the latest changes and interpretations of policy. In addition, there should be a formal quality assurance program. For customer service representatives working on the lines at district field offices or answering questions on the telephone, quality assurance of their work should include the possibility for supervisors to monitor the correctness and manner of delivery of the service given.

- **Using fees for immigration services more effectively.** The Commission supports the imposition of users fees, but emphasizes that: (1) the fees should reflect true costs; (2) the agencies collecting the fees should retain and use them to cover the costs of those services for which the fees are levied; (3) those paying fees should expect timely and courteous service; and (4) agencies should have maximum flexibility to expand or contract their response expeditiously as applications increase or decrease.

  The current situation has a number of weaknesses. First, some programs are now undercharging (or not charging) fees while others reportedly are overcharging. INS is now reviewing its fees to determine where adjustments should be made. Second, some fees go into the General Treasury while others are held by the agencies collecting them and used for the function for which they were collected. Third, agencies do not have effective systems for accurately anticipating the volume of applications, forecasting their fee receipts, and requesting appropriate levels of funding from fee accounts to meet demand. Fourth, when there is an

unforeseeable increase in the number of applications, there is a significant lag time before an agency is able to use the increased fee revenue to expand its service capacity. For example, it took several months to develop a reprogramming request and then obtain permission for a reprogramming of funds when naturalization and section 245(i) adjustment applications increased significantly. This delay resulted in a growing backlog of persons awaiting service. Providing more flexibility would require agreement from the congressional appropriations committees that they need not approve the reprogramming of fees when the need for additional resources is related solely to an increase in the volume of applications.

IMPROVED DATA AND ANALYSIS

The Commission reiterates its 1994 recommendations[7] regarding the need for improvements in immigration data collection, coordination, analysis, and dissemination. Although progress has been made, much more needs to be done. Reliable and timely data are crucial to the effective enforcement of immigration law. They are the basis for the effective implementation of ongoing and new programs. And, ultimately, they are the only means of assessing results achieved and reaching the conclusions necessary for responsible policymaking.

The Commission reiterates its 1994 recommendations regarding the need for improvments in immigration data collection, coordination, analysis, and dissemination.

Data problems throughout the immigration system have long been evident. The Panel on Immigration Statistics of the National Research Council concluded in 1985 that the "story" about immigrant data was "one of neglect."[8] Despite increases in congressional funding and some notable improvements at the INS, the available data remain incomplete—a problem that exists to some degree in each agency involved in the immigration system.

---

[7] U.S. Commission on Immigration Reform. 1994. *U.S. Immigration Policy: Restoring Credibility.* Washington, DC. 179-86.

The Commission believes there is a pressing need for improvements in immigration data collection, standardization, intra- and inter-agency linkages, timely dissemination, rigorous analysis, and use in policymaking. The Commission urges the federal government to support continuing research and evaluation on all aspects of immigration. Further, the Commission urges the Congress to insist upon the organizational structures needed to create and maintain high-quality statistical data.

The statistical function must be given high priority and sufficient institutional control and authority. Quality data do not evolve as a by-product of disjointed administrative data-gathering responsibilities. Quality data ultimately require a statistical system that can satisfy policy-relevant and management information needs through an integrated, centrally-coordinated approach.[9]

In recent years Congress has addressed the statistical problem by requiring improvements in specific arenas—primarily through automation—and by appropriating increased funding. These steps are encouraging and the Administration appears to have embarked successfully on some programs for automated data collection. The INS already has established separate systems for data collection and retrieval for its core enforcement and benefits functions.[10] Under the Commission's proposals it is essential that the statistical systems under DOJ enforcement and DOS benefits retain an automated and integrated design. However, statistical systems cannot be improved simply by automating data collection.

As the Panel on Immigrant Statistics concluded, it would be naive

[9] Norwood, J. L. 1995. *Organizing to Count: Change in the Federal Statistical System*. Washington, DC: The Urban Institute Press.

[10] However, there still remain more than one dozen separate data collection systems that often suffer from various internal deficiencies and remain to be integrated into larger core systems.

to assume that automation will solve the problems that have been evident for too long a time in statistical operations.[11] The Panel cited an agency-wide lack of understanding and commitment to high-quality data and the need for the development and acceptance of appropriate standards as the primary causes of today's inadequate state of affairs. It is necessary to change priorities from data collection solely for individual division administrative purposes to the production of data for integrated enforcement, benefits, quality control, and analytic uses.

Congress also has been critical of the way in which data has been disseminated. In the context of congressional debate, sporadic release of data has the potential for politicizing statistics. Regular and scheduled release of statistics, preferably monthly, can go a long way toward depoliticizing data and focusing attention on unbiased analysis. The Department of Labor's Bureau of Labor Statistics, with an autonomous and scheduled release of data, offers one model for the dissemination of data with no relation to the policy calendar.

The Commission believes each agency with immigration responsibilities should have a statistical office charged with final authority over data coordination, agency-wide definitions and systems integration, quality monitoring, research and analysis, and regular dissemination. Data collection and analysis must be a priority and be reflected in the statistical branch's organizational placement. Only sufficiently high placement and authority can ensure that its mission is successfully discharged.

Interagency cooperation and coordination of agencies that produce or use immigration data can enhance the data's timeliness and value significantly. Cooperation also can lead to significant gains in the

use of scarce resources—be they funding, staff, time, or public tolerance. Such coordination must insure monitoring of progress, adherence to standards, common definitions, timeliness in publication, and full disclosure of methods, methodology, procedures, and problems. Only then will significant improvements occur.

Consideration should be given to the creation of a *permanen*t taskforce on immigration statistics that would coordinate interagency efforts to improve all aspects of the statistical system. Various *ad hoc* and temporary governmental working groups have tackled a part of, or the whole of, the data collection system.[12] A formally-charged taskforce would craft the basis for interagency agreements and possible statutory and regulatory changes. To be effective, the taskforce would require appropriate institutional support. It would marshal interagency collaboration on data whenever feasible, especially on definitional issues and on what information is collected. The taskforce should conduct an exhaustive review of the data collected in each agency, identify overlap or potential interagency data linkages, evaluate technical and computer needs, propose standard definitions, and make recommendations.

Information Needs

Little can be done to make significant advances in our understanding of immigration without improvements in data and targeted research. Policymaking is particularly hampered by lack of knowledge from detailed surveys and longitudinal studies in three areas: the experiences and impacts of immigrants; the experiences and impacts of foreign students and foreign workers admitted for limited duration stays; and the patterns and impacts of unlawful mi-

[12] The INS has convened an Interagency Working Group on Immigration Statistics that has reviewed various data problems. It has had a significant impact on Administration funding for an immigration component in the Current Population Survey, the preeminent U.S. source of data on national trends and on the U.S. labor force. It also made significant contributions to ultimate Administration support for the New Immigrant Survey.

gration. There is a seemingly inexhaustible range of options for collecting data and, especially, topic areas needing research.[13] Examples of pressing analytic data needs are discussed below.

Legal Permanent Admissions

The gap between questions about legal immigration and the data needed for answers is greater than in almost any other area of public policy. It is not now possible to address fully pressing policy questions about the changing skill makeup of newly admitted immigrants over time, the transitions between temporary and permanent residence status, the effects of today's immigration on future demand through family reunification, and the success and impact of immigrants in the U.S. economy.

To answer such questions, policymakers have a crucial need for both data on detailed classes of admission and the capacity to track changes over time. Recently, the Administration funded the collection of data on immigrants in the monthly Current Population Survey. However, these and other survey data neither collect detailed information about status nor distinguish between legal and illegal foreign residents, much less between the various temporary or permanent admission statuses.

The INS yearly admissions data are the most immediate source of information on immigrant entry class. Yet, the data serve primarily as a minimalist administrative count of individuals. Identifying family units would make it possible to evaluate admissions as they really are: the immigration not of individuals but of families. The quality and type of data gathered on labor force status depends on definitions that do not conform with modern concepts. Including information about immigrant sponsors would go far to increase our

[13] Edmonston, B. (ed.). 1996. *Statistics on U.S. Immigration: An Assessment of Data Needs for Future Research*. Washington, DC: National Academy Press.

ability to make reliable forecasts about the numbers and skill composition of tomorrow's immigrants.

The New Immigrant Survey discussed in the introduction to this report demonstrates the policy value of expanded data on new admissions. For the first time we have an accurate picture of education and English ability, as well as the capability for studying transitions from temporary to permanent status, the characteristics of sponsors, and the financial well-being of new entrants. Designed as a pilot, the NIS should be seriously evaluated for its costs and for its value as a model for a longitudinal survey.[14] Experts agree that only a longitudinal survey ultimately can answer Congress' most pressing questions.[15]

Finally, it is essential to improve our knowledge of newly naturalizing citizens. In the past few years there have been dramatic increases in the numbers of persons naturalizing, but little is known about the individual circumstances under which residents choose to naturalize. Only more detailed knowledge about such things as eligibility and motivations will yield indicators to forecast the number of future applications. Accurate forecasts are needed to meet demand and to organize processing integrity.

---

[14] A longitudinal survey would, among other things, help address serious deficiencies due to "lost data sources." In the 1950s, the U.S. discontinued collecting data on persons leaving permanently. Without accurate emigration data, demographic estimates of the size and growth of the foreign population are imprecise exercises. In the 1980s, the "Alien Address" database was discontinued. Knowing the size of the legal population makes it possible to get significantly more precise estimates of the size and location of illegal residents.

Edmonston, eds.). 1997. *The New Americans: Economic, Demographic, and Fiscal Effects of Immigration*. Washington, DC: National Academy Press.

Limited Duration Admissions

There exists remarkably little comprehensive or policy-relevant knowledge or research on the administration of the LDA system or its impact on the U.S. economy.[16] Problems in the LDA data system are even more pervasive than in the legal permanent system.

The Commission believes that improvements in data collection and analysis of LDAs and the impact of these admissions should be considered an urgent priority. The INS has made significant efforts to improve its data and has directed funds toward new computer systems. The Commission urges the Congress to support continued innovation in data collection and storage retrieval. As in our last report, the Commission suggests that building upon existing administrative recordkeeping will be most cost-effective.

Improved data and new research efforts are especially critical as there is remarkably little known about the number, characteristics, and impact of LDA workers and foreign students. For example, important basic information is lacking on LDA workers—their geographic location in the U.S., occupations, or labor-market effects. Longitudinal data and analysis are needed regarding the transition of LDA workers to immigrant status—directly or through other temporary categories. Likewise, little is known about the total population and characteristics of foreign students, their geographic distribution, academic status, duration of stay, employment activities, or change and adjustment of legal status.

There is a critical need to continue and extend improvements in departure data—one of the more crucial components of the entire immigrant information system. Precise exit information is necessary to track duration of stay, compliance with visa regulations, and overstays. Further, the utility of current data could be meaningfully

[16] Lowell, B.L. (ed.). 1996. *Temporary Migrants in the United States.* Washington, DC: U.S. Commission on Immigration Reform.

extended, for example, by collecting accurate information on intended destination. The Commission endorses continued emphasis on the improvement and introduction of electronic/paperless mechanisms for the collection of departure data.

Unauthorized Migration

The measurement and study of illegal aliens—a clandestine population—always has been fraught with difficulties. Ironically, a focus on estimates of this population may well have produced more accurate numbers than official figures on legal residents. Yet, if our research knowledge of legal immigrants is circumscribed, and research on LDAs nearly nonexistent, the analysis of the illegal population, while extensive, suffers from combinations of problems.

At a rudimentary level, there is a need to know more about the number of illegal aliens who entered without inspection [EWI] in contrast to temporary admittees who overstay the time permitted on their LDA visa.[17] In terms of enforcement efforts the distinction is important, but there is an unknown range of error in current estimates. What proportion fall into each type? Improvements in existing databases are sorely needed along with research into innovative and reliable means of estimating each population.

Much could be gained from knowing about the varied means by which EWIs and LDA overstayers come to the United States and the length of their stay. If, for example, LDA overstayers had shorter durations of residence in illegal status, then their proportion of the total illegal population is, in a sense, more "fluid." At a more critical extreme, subpopulations of highly mobile and circular mi-

[17] U.S. General Accounting Office. 1995. *Illegal Immigration: INS Overstay Estimation Methods Need Improvement.* GAO/PEMD-95-20. Washington, DC: U.S. Government Printing Office.

grants may stay for only short periods in the United States. These highly mobile individuals would not be fully captured in standard estimates of the illegal population.[18]

[18] There are few reliable estimates of the highly-mobile, illegal subpopulation, nevertheless, *ad hoc* estimates increasingly are heard. A correct estimate of this population should adjust for its average, or "person year," size. For example, if 100 illegal workers spent one-half year working in the United States, they would earn the yearly wages of 50 workers. See Heer, D.M. 1990. *Undocumented Mexicans in the United States*. Cambridge: Cambridge University Press.

CONCLUSION

This report concludes the work of the U.S. Commission on Immigration Reform. Together with our three interim reports, this final set of recommendations provides a framework for immigration and immigrant policy to serve our national interests today and in the years to come. The report outlines reforms that will enhance the benefits of legal immigration while mitigating potential harms, curb unlawful migration to this country, and structure and manage our immigration system to achieve all these goals. Most importantly, this report renews our call for a strong commitment to Americanization, the process by which immigrants become part of our community and we learn and adapt to their presence. Becoming an American is the theme of this report. Living up to American values and ideals is the challenge for us all.

APPENDIX A

IMMACT: PROVISIONS AND EFFECTS

The Immigration Act of 1990 [IMMACT] attempted to balance a number of competing interests. First, it established annual overall limits on total legal immigration, but allowed those limits to be "pierced" in response to changing levels of nuclear family applications and humanitarian admissions. Second, it created a guaranteed minimum number of visas for close family members if there are increases in the number of immediate relatives of U.S. citizens seeking entry. Third, it increased the number of persons admitted for employment reasons, with higher priority given to professionals and highly-skilled persons. Fourth, it created a diversity class of admissions for persons from nations that have not recently sent many immigrants to the United States.

IMMACT legislated a worldwide level of 675,000 family-based, employment-based, and diversity immigration admissions per year.[1] This ceiling may be pierced if immediate relative applications exceed expectations and does not include refugee, asylum, or other humanitarian admissions. The worldwide pierceable ceiling represented an increase of about 40 percent in the permitted number of admissions compared to previously legislated levels. Prior to IMMACT, immediate relatives (who entered without regard to numerical limits) averaged about 210,000 per year, and numerically-limited categories were set at 270,000. Humanitarian-based admissions were set outside of regular immigration ceilings, as they con-

[1] A transition worldwide level of 700,000 admissions was in effect during FY 1992-1994. Many admissions during the first two years were from the pre-IMMACT backlog and do not necessarily reflect the aims of the new legislation.

tinue to be under IMMACT. Most of IMMACT's legal immigration provisions went into effect in FY 1992, with the permanent diversity program beginning in FY 1995.

More specifically, IMMACT contained the following provisions affecting immigration numbers and immigrant characteristics.

Family-based admissions. IMMACT established a worldwide limit of 480,000 family-based admissions. Immediate relatives—including spouses, minor children, and parents of U.S. citizens—continue to enter without regard to numerical limits. Their actual admission numbers are subtracted from the worldwide limit to determine how many other family members (i.e., adult unmarried children of U.S. citizens, spouses and minor children of legal permanent residents, married children of U.S. citizens, and siblings of adult U.S. citizens) will be permitted to enter the following year. IMMACT set a minimum floor of 226,000 numerically-limited family immigrants. In addition, unused employment visas are transferred to the next year's family admissions.

The actual number of admission slots available and used each year varies. During the past five years, annual family admissions have been as low as 460,653 in FY 1995 and as high as 595,540 in FY 1996.[2] Variation can be seen in both the immediate relative and the numerically-limited categories.

---

[2] Processing problems explain some of the below average numbers for FY 1995 and above average ones for FY 1996. Higher demand for adjustment of status within the United States followed enactment of § 245(i) that permits those not in lawful status to pay a penalty to obtain their legal immigration status in the U.S. INS was not prepared for the large increase in applications, resulting in an adjustment backlog. Some of those who normally would have received their green card in FY 1995 had to wait until FY 1996. In the meantime, the large number of unused FY 1995 employment-based admissions were transferred to the family categories for FY 1996.

One goal of IMMACT was to reduce waiting times, particularly for the spouses and minor children of legal permanent residents (FB-2A Preference). Recognizing that the 2.7 million aliens who were given LPR status by the Immigration Reform and Control Act would petition for their immediate families, IMMACT provided three years of additional visas for spouses and minor children of legalized aliens. Because per-country limits sometimes create admission backlogs for affected nationalities, it also required that 75 percent of the FB-2A numbers would be exempt from per-country limits.

The family categories have attracted far more applicants than there are admission visas and, hence, large backlogs have developed. The total backlog of family applicants stood at 3.5 million at the start of FY 1997, essentially unchanged from FY 1996. About one million individuals are awaiting legal admission under FB-2A. As projected by the Commission in its 1995 report, the numbers on the FB-2A waiting list have declined slightly from the prior year.[3] However, the waiting time until admission has continued to grow since IMMACT. From an already long wait of just less than two and one-half years in FY 1992, the waiting time in the backlog has continued to increase each year until, at the time of this report, it is almost four and one-half years. The priority date for admission advances little each month, meaning longer and longer waits for new applicants. Anticipation of such trends led the Commission to recommend in its 1995 report a series of changes to the numerically-limited family categories, but no congressional action was taken. The Commission

[3] Much of the initial rapid increase in the spouse and children of the LPR backlog was due to IRCA legalization. Now most of those family members already have made their applications and, indeed, new applicant numbers have declined steadily since 1992. Even so, there were still 82,521 new applicants entering the backlog in 1996. In most years, about 90,000 admission slots are available for FB-2A, meaning that the waiting list will experience only modest decreases in the future.

has projected that waiting times could reach as long as ten years for applicants at the end of the waiting line.[4]

Employment-based admissions. IMMACT extensively revised the employment-based categories and numbers. The legislation emphasized the admission of high-skilled persons and added a new category for investors. IMMACT allows up to 140,000 employment-based admissions each year, up from an annual limit of 54,000 under previous statute. Covered under these numbers are the principal applicants, as well as their spouses and minor children (both referred to as beneficiaries). The numbers are distributed over several categories, generally reflecting educational and skill level. IMMACT also placed a cap of 10,000 admissions on lesser-skilled admissions.

Employment-based admissions increased significantly under IMMACT, but they have not approached the annual ceiling of 140,000 (except when the Chinese Student Protection Act of 1992 [CSPA] permitted Chinese who had entered the U.S. before Tiananmen Square to become permanent residents under the employment category). Subtracting out the onetime admissions under CSPA, skilled and unskilled employment-based admissions have gone from about 100,000 in FY 1994 to 81,000 in FY 1995 and back up to 117,000 in FY 1996. The increase in FY 1996 appears to reflect a catchup from

---

[4] In principle, the recent surge in the naturalization of potential sponsors could reduce the backlog and waiting time of spouses and children of LPRs. Sponsors who have naturalized can petition for the admission of their spouses and minor children under the unlimited citizen reunification category, thus effectively moving them out of the queue. However, this process will not decrease the backlog in an expeditious fashion. Even assuming rather high rates of naturalization, the Commission projections also show that it will take at least another decade before today's backlog can be reduced to acceptable numbers. Surprisingly, early indications are that the large volume of naturalizations since 1995 have not resulted in increases of relatives of U.S. citizens in the family preference total. (DOS Bureau of Consular Affairs. 1997. *Visa Bulletin* 73:7 A7.)

administrative processing delays in the previous year. The most notable increase through this period has been in the first preference, particularly in the subcategory for executives and managers of multinational corporations.[5] The first preference had fewer than 5,500 admissions in IMMACT's first year of implementation but now has more than 25,000 admissions.

In terms of the backlog of employment-based visas, the category of unskilled workers (EB-3B preference) remains heavily oversubscribed as of FY 1997, with nearly a seven-year wait for admission for all nations. Otherwise, only India is oversubscribed with nearly a two-year wait for admission for employment professionals with advanced degrees (EB-2) and skilled workers (EB-3A). Employment-based admissions must be closely monitored to know whether or not they reach their limit in the future and whether per-country limits impede timely entry of the highly-specialized workers who are genuinely needed by U.S. business.

Diversity admissions. The diversity immigrant provisions in IMMACT seek to increase national diversity in the immigrant population by widening access for immigrants from underrepresented countries whose citizens have neither strong family nor job ties to the United States. The permanent program began in October 1994. It provides 55,000 admission slots per year to nationals of countries that have sent fewer than 50,000 legal immigrants to this country over the previous five years. Each applicant must have a high school education or its equivalent or two years of work experience in an occupation requiring at least two years of training or experience. Persons eligible to enter are chosen by lottery. In FY 1996, some eight million applications were received by the Department of State.

---

[5] Multinational corporations include U.S.-based companies with overseas operations and large and small foreign businesses that establish U.S. offices, subsidiaries, or affiliates.

About 40,000 diversity immigrants entered in FY 1995 and 58,000 in FY 1996. As with other admission categories, the FY 1995 numbers are misleading because of the delays in processing adjustments of status. Unlike other categories, however, the diversity program does not permit a waiting list of unprocessed applicants who will be interviewed the following year.

Refugee and other humanitarian admissions. Various categories of people may obtain LPR status outside of the worldwide pierceable ceiling. The largest groups are refugees admitted from overseas as part of the refugee resettlement program and asylees granted asylum domestically. After one year, refugees and asylees become eligible to adjust to LPR status. They are counted when the adjustment occurs. Other humanitarian-based admissions include Amerasians, parolees permitted to adjust status under special legislation, and individuals granted suspension of deportation. The total numbers admitted under these categories vary depending largely on the annual refugee admission levels determined through Presidential-Congressional consultation. All humanitarian admissions reached a high in FY 1994 of 160,000 and dropped modestly to 123,000 and 138,000 in FYs 1995 and 1996, respectively.

Future trends. As indicated, the year-to-year admissions under IMMACT have followed an up-and-down course. Future trends are difficult to project. A number of factors may increase future admission levels. Given the pace with which immigrants are naturalizing, growth in the number of immediate relatives may occur as newly naturalized citizens petition for their families. While LPRs may petition for spouses and minor children, until naturalization, they may not petition for the admission of a parent. It is also unlikely that the numerically-limited family preferences will be undersubscribed in the foreseeable future. Continuing backlogs ensure that available family quotas, as well as any unused employment numbers transferred to the family categories, will be filled.

At the same time, new provisions adopted in the recent welfare reform (The Personal Responsibility and Work Opportunity Reconciliation Act of 1996) and the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 may dampen future admissions despite the lengthy waiting lists. In particular, IIRIRA requires all family members to be sponsored by a U.S. petitioner whose income meets at least 125 percent of the poverty level. Sponsors must sign legally-binding affidavits under which they pledge to provide any financial support needed by the new immigrants. In addition, the welfare reform legislation bars noncitizens from most income transfer programs. Some U.S. family members may be unwilling or unable to take on these new financial responsibilities for new immigrants.

APPENDIX B

STATEMENT OF COMMISSIONER WARREN R. LEIDEN

While I agree with most of the findings and recommendations of the Commission majority, there are two subjects of major recommendations on which I am moved to make separate statements —one in dissent (Legal Permanent Admissions) and one in concurrence (Structural Reform).

Legal Permanent Admissions

Legal immigration needs reform of priorities and allocations, but current levels of legal immigration are in the national interest. Virtually all the research and analysis received by the Commission indicated that the current levels of legal immigration continue to provide a net positive benefit to America in a multitude of ways. Whatever interest is examined—economic, social, political, scientific, or cultural—the current levels of legal immigration are found to benefit each of these aspects of American life. The current levels of legal immigration that were established by the Immigration Act of 1990 have served this country well. And, after the current one-time increase that is the result of the 1986 legalization program, the overall number of legal immigrant admissions can be expected to moderate and decrease.

The current overall levels of legal immigration should be maintained until there is another opportunity for review in three to five years.

The majority recommends a one-quarter reduction in legal immigration from current levels, but not now, rather in five to eight years.

This reduction comes at the expense of thousands of American families who have been patiently waiting for legal reunification with their close relatives overseas. It is accomplished by eliminating three of four family preference categories and simply shutting the door on thousands of sons, daughters, and siblings of U.S. citizens.

There is no convincing argument for this drastic reduction in legal immigration now or years from now. Current levels of legal immigration clearly serve the national interest and can better do so if priorities and allocations are reformed.

Prioritize family-based admissions without eliminating family **reunification.** Spouses and minor children of U.S. citizens and lawful permanent residents [LPRs] and parents of U.S. citizens should receive the highest priority for immigration, but this can be accomplished without eliminating the immigrant categories for adult sons and daughters or siblings of U.S. citizens.

The family preference categories should be reordered, placing the spouses and minor children of LPRs at the top, with a "spilldown" of unused visas going to the remaining family categories. This approach would ensure the quickest reduction in the shameful backlog of spouses and minor children of LPRs, without sacrificing the family unification of those sons and daughters who simply turned 21 years old. The majority, by its determination to reduce legal immigration, is forced to call for the elimination of sons and daughters preference categories. It is wholly unnecessary to impose this hardship when simple priority setting can accomplish the same end.

The backlog of spouses and children of LPRs has already begun to decrease, and there are fewer new applicants than there are individuals being accorded immigrant status under the "second preference category." This indicates, as predicted, that the current backlogs can be reduced and that a new stable level of family immigration can be achieved once the one-time "echo" of the legalization

program has been processed. The small increases in the family preference categories for sons and daughters can be quickly made up once the top preference category is current.

Preserve employment-based immigration levels and reform labor market tests without penalizing employers. I dissent from the majority's recommendation to reduce employment-based immigration by almost 30 percent to only 100,000 admissions per year (including spouses and children). This level was already exceeded in FY 1996, when employment based legal immigration reached 117,000. Moreover, the continued growth of the international economy promises to increase employment-based legal immigration up to at least the current level of 140,000 admissions per year. The majority's recommendation to cut annual employment based admissions down to 100,000 per year would result in immediate backlogs, which would recreate precisely the situation that the Immigration Act of 1990 was enacted to cure.

Proposals that would result in the immediate creation of new backlogs are clearly wrong. The employment-based immigration ceiling should be kept at the current level, with review in three to five years.

New requirements and procedures need to be developed to replace the labor certification process to test the *bona fides* of the petitioning employer's need and to avoid adverse effect on similar U.S. workers. I dissent from the majority's recommendation that the solution is that such employers be required to pay a "substantial fee" or tax for the privilege of sponsoring international personnel.

The "substantial fee" approach simply does not address the real issues. It substitutes a penalty on certain employers for an honest assessment of what is beneficial to the national interest and what is practical in an environment of heightened international competition. The majority wants to label the imposition of fees to be a use of

"market forces," but it is obvious that government-imposed tariffs and fees are the complete opposite of market forces. For the government to charge a substantial, arbitrarily-set fee that will be used for purposes other than expense of adjudication and processing the application would be more like a tax, the antithesis of market forces. The majority would not only impose a penalty fee but would also require such employers to meet subjective tests of eligibility, such as whether it took "appropriate steps to recruit U.S. workers." It is hard to imagine that this proposal would not result in a new bureaucracy sitting in judgment on employers' compliance with new regulations and requirements.

The majority's proposal will serve more to penalize U.S. employers who petition for international personnel than to prevent adverse effect. Unfortunately, a proper analysis of these issues and more thoughtful recommendations remain to be done.

Structural Reform

Restructure the federal immigration responsibilities to separate the adjudications function from the enforcement function but keep them in the Department of Justice along with the appeals function. The federal responsibilities to conduct immigration enforcement, both at the border and inside the U.S., and to adjudicate immigration and naturalization applications and petitions have not been managed adequately.

Although it has received substantial increases in appropriations for staff, equipment, and other resources, the enforcement function continues to suffer from a lack of strategic coordination. While important improvements have been made in enforcement at the border, coordination with interior enforcement is tactical at best and often exists in form only. Interior enforcement is led and managed by officials who have been charged with too many other responsibilities.

At most levels of the INS, inadequate attention is given to the glaring imbalances in staff and resource allocations to the sequential steps of the enforcement process so that the consequences of apprehension are neither swift nor certain. Distracted and overloaded management also increases the risk of error and misconduct by its subordinate staff. Simply put, there is not a single, focused, national chain of command to pursue an integrated national enforcement strategy, and the immigration function and the nation suffer as a result.

Similarly on the adjudications side, huge increases in fee account receipts have not resulted in proportional improvements in accuracy or efficiency. Managers at the local, regional, and national levels have not been adequately concentrated on their adjudications responsibilities in immigration and naturalization. The economies of scale and additional resources provided by the substantial caseload (and therefore revenue) increases have not been converted into improvements, rather there is the appearance that there is just too much to do.

The lack of success in enforcement and adjudications is not simply for want of trying. The immigration agencies are served by many talented and determined staff and managers. The current administration of the Immigration and Naturalization Service has made impressive strides forward on a number of fronts and its accomplishments are historic.

If, despite huge increases in funding and dedicated staff and leadership, the federal government still has not achieved adequate management of its immigration responsibilities, it is inescapable that something else must be done in order to arrive at a successful equation. Based on the information, interviews, and analyses the commission has reviewed over the past several years, it becomes an inescapable conclusion that the primary immigration functions need to be separated and restructured.

Separation of the enforcement and adjudications functions is the only solution to the current overload of responsibilities competing for attention that is obvious at every level of the INS. Separation of the functions would permit the establishment of unified, focused chains of command and operations at every level. Separation of enforcement from adjudications would allow each function to have a clear mission and to set clear goals on by which performance could be judged and accountability enforced. Separate functions would benefit greatly from the ability to gear hiring, training, promotions, and discipline to a clear mission.

At present, with its combined missions, the INS is often in internal contradiction, and its personnel, trained primarily in one mission or the other, are asked to crisscross from positions calling for one type of expertise and then the other. The most telling evidence of the value of separating the enforcement and adjudications functions comes the recent history of INS itself. The two most successful examples of INS adjudications programs, the 1986 Legalization program and the creation of an independent corps of asylum officers in 1990, are both instances where adjudications programs were consciously and deliberately kept separate and insulated from the enforcement mission of the INS. These practical, real world examples conclusively make the case for separation of enforcement from adjudications.

Of course, separation and restructuring of the immigration functions is not a panacea in and of itself. The combined missions are far from the only problem confronting the agencies, and the separation of the functions should be seen only as providing a necessary foundation from which real, lasting solutions can be hammered out to the many substantive challenges confronting the government. The substantive problems of operations and policy remain the fundamental issues of concern; structural changes provide means to better accomplishing these ends.

The benefits of restructuring can be gained with far less disruption, at less cost, and with greater chance of success if it is accomplished within the Department of Justice. The two main functions of the INS—enforcement and adjudications—should be separated into two different agencies within the Department of Justice, with separate leadership. This would also permit the insertion of a senior level office in the Department of Justice to coordinate and lead the separate functional agencies.

The creation of the Executive Office for Immigration Review [EOIR], which separated the immigration hearings and appeals function from the rest of INS in 1983, is a good model for this restructuring. Like the EOIR, each agency should have its separate mission, career paths, training, and management, while still benefiting from policy and strategic coordination at senior department level.

The Department of Justice is the proper place for the immigration enforcement function and it is the proper place for the adjudications function. The Department of Justice has long experience with and is the preeminent repository of expertise in both the immigration enforcement and adjudications functions. The Department of Justice epitomizes the values of due process and the rule of law, which are especially important in achieving effective enforcement and fair, accurate adjudications for a well-regulated, highly-selective legal immigration system. The division of these two immigration functions, within the Department of Justice, would be far less disruptive to either responsibility at a time when both adjudications workloads and the need for enforcement activities are at record levels.

In contrast, transferring the adjudications function to the Department of State would require it to integrate into its organization large operations programs with which it has little familiarity. Any department other than Justice would have to undertake the absorption of new missions, expertise, and institutional values with which it has little experience.

Keeping both functions within the Department of Justice would be far less costly than the transfer of all adjudications activities to the Department of State or another department. The personnel, training, facilities, and management are already fully part of and integrated into Department of Justice. Separation of enforcement and adjudications within the Department of Justice raises mostly issues of management and structure, rather the basic re-creation of a substantial institution in an entirely new setting.

Moreover, keeping adjudications within Justice would not require the proposed creation of an entirely new independent agency for immigration review in place of EOIR. There are substantive arguments on both sides of this issue, and it is one that should be decided on the basis of merit, not mandated simply due to interdepartmental restructuring.

As in all cases of organizational change, some predictable disruption and added expense are justifiable if the outcome is most likely to be an improvement. However, the consequences of the proposed transfer of all adjudications functions to the Department of State are far from certain. Unlike the Department of Justice, the Department of State would be undertaking a entirely different mission with which it has had little experience or interest. Historically, immigration and consular matters have received tertiary attention and status at the Department of State. It is a gamble to think that these longstanding attitudes will change for the better. While some argue that the Department of State could and should adopt an entirely new mission in the post-Cold War era, beginning this debate by making the massive implantation of the entire federal immigration adjudications function puts the horse before the cart and is a great risk to take.

The Department of State has not had experience with the large volume of substantive adjudications that heretofore have been done by the Department of Justice. Moreover, elementary concepts of

legal process, including administrative and judicial review, precedent decisions, and the right to counsel, have been vigorously resisted by the Department of State throughout its history of consular affairs. The Department of State has energetically fought all attempts in litigation and in legislation to make individual consular decisions subject to any review within the Department of State itself or by the federal courts. It is difficult for anyone familiar with this history to conceive that these Department of State traditions would soon give way to modern legal concepts and the consistency and accuracy that is their goal.

In contrast, the Department of Justice has the experience and the expertise. It needs only the restructuring and separation of enforcement from adjudications, with dedicated leadership and management for each, to have the best chance of success, at less cost and with less disruption of the fundamental immigration responsibilities.

CONCLUSION LIX

INTRODUCTION

Immigration and immigrant policy is about immigrants, their families and the rest of us. It is about the meaning of American nationality and the foundation of national unity. It is about uniting persons from all over the world in a common civic culture.

The process of becoming an American is most simply called "Americanization," which must always be a two-way street. All Americans, not just immigrants, should understand the importance of our shared civic culture to our national community. This final report of the U.S. Commission on Immigration Reform makes recommendations to further the goals of Americanization by setting out *immigrant* policies to help orient immigrants and their new communities, to improve educational programs that help immigrants and their children learn English and civics, and to reinforce the integrity of the naturalization process through which immigrants become U.S. citizens.

This report also makes recommendations regarding *immigration* policy. It reiterates the conclusions we reached in three interim reports—on unlawful migration, legal immigration, and refugee and asylum policy—and makes additional recommendations for reforming immigration policies. Further, in this report, the Commission recommends ways to improve the structure and management of the federal agencies responsible for achieving the goals of immigration policy. It is our hope that this final report *Becoming An American: Immigration and Immigrant Policy,* along with our three interim reports, constitutes a full response to the work assigned the Commission by Congress: to assess the national interest in immigration and report how it can best be achieved.

MANDATE AND METHODS

Public Law 101-649, the Immigration Act of 1990, established this Commission to review and evaluate the impact of immigration policy. More specifically, the Commission must report on the impact of immigration on: the need for labor and skills; employment and other economic conditions; social, demographic, and environmental impact of immigration; and impact of immigrants on the foreign policy and national security interests of the United States. The Commission engaged in a wide variety of fact-finding activities to fulfill this mandate. Site visits were conducted throughout the United States. Commission members visited immigrant and refugee communities in California, Texas, Florida, New York, Massachusetts, Illinois, Arizona, Washington, Kansas, Virginia, Washington, DC, Puerto Rico and the Commonwealth of the Northern Mariana Islands. We also visited such major source countries as Mexico, the Dominican Republic, Cuba, Haiti, and the Philippines. To increase our understanding of international refugee policy issues, we visited Bosnia, Croatia, Germany, and Kenya, and we consulted with Geneva-based officials from the U.N. High Commission for Refugees and the International Organization for Migration. We held more than forty public hearings, consultations with government and private sector officials, and expert roundtable discussions.

IMMIGRATION TODAY

The effects of immigration are numerous, complex, and varied.[1] Immigrants contribute in many ways to the United States: to its vibrant and diverse communities; to its lively and participatory democracy; to its vital intellectual and cultural life, to its renowned

[1] Please see the full report for a more detailed discussion of the economic, social, demographic, foreign policy, and national security implications for U.S. immigration.

Immigrant Admissions by Major Category: FYs 1992-1996

Category of Admission	1992	1993	1994	1995	1996
TOTAL	**810,635**	**880,014**	**798,394**	**716,194**	**909,959**
SUBJECT TO THE NUMERICAL CAP	**655,541**	**719,701**	**662,029**	**593,234**	**771,604**
FAMILY-BASED IMMIGRANTS	**502,995**	**539,209**	**497,682**	**460,653**	**595,540**
Immediate Relatives of U.S. citizens	235,484	255,059	249,764	220,360	350,192
Spouses and children	170,720	192,631	193,394	171,978	283,592
Parents	64,764	62,428	56,370	48,382	66,600
Children born abroad to alien residents	2,116	2,030	1,883	1,894	1,658
Family-sponsored immigrants	213,123	226,776	211,961	238,122	293,751
Unmarried sons/daughters of U.S. citizens	12,486	12,819	13,181	15,182	20,885
Spouses and children of LPRs	90,486	98,604	88,673	110,960	145,990
Sons and daughters of LPRs	27,761	29,704	26,327	33,575	36,559
Married sons/daughters of U.S. citizens	22,195	23,385	22,191	20,876	25,420
Siblings of U.S. citizens	60,195	62,264	61,589	57,529	64,897
Legalization dependents	52,272	55,344	34,074	277	184

job-creating entrepreneurship and marketplaces; and to its family values and hard-work ethic. However, there are costs as well as benefits from today's immigration. Those workers most at risk in our restructuring economy—low-skilled workers in production and service jobs—are those who directly compete with today's low-skilled immigrants. Further, immigration presents special challenges to certain states and local communities that disproportionately bear the fiscal and other costs of incorporating newcomers.

Properly-regulated immigration and immigrant policy serves the national interest by ensuring the entry of those who will contribute most to our society and helping lawful newcomers adjust to life in the United States. It must give due consideration to shifting economic realities. A well-regulated system sets priorities for admission; facilitates nuclear family reunification; gives U.S. employers access to a global labor market while ensuring that U.S. workers are not displaced or otherwise adversely affected; and fulfills our commitment to resettle refugees as one of several elements of humanitarian protection of the persecuted.

AMERICANIZATION AND INTEGRATION OF IMMIGRANTS

A DECLARATION OF PRINCIPLES AND VALUES

Immigration to the United States has created one of the world's most successful multiethnic nations. We believe these truths constitute the distinctive characteristics of American nationality:

- American unity depends upon a widely-held belief in the principles and values embodied in the American Constitution and their fulfillment in practice: equal protection and

justice under the law; freedom of speech and religion; and representative government;

- Lawfully admitted newcomers of any ancestral nationality—without regard to race, ethnicity, or religion—truly become Americans when they give allegiance to these principles and values;

- Ethnic and religious diversity based on personal freedom is compatible with national unity; and

- The nation is strengthened when those who live in it communicate effectively with each other in English, even as many persons retain or acquire the ability to communicate in other languages.

As long as we live by these principles and help newcomers to learn and practice them, we will continue to be a nation that benefits from substantial but well-regulated immigration. We must pay attention to our core values, as we have tried to do in our recommendations throughout this report. Then, we will continue to realize the lofty goal of *E Pluribus Unum*.[2]

AMERICANIZATION

The Commission reiterates its call for the Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy and equal opportunity. The United States has fought for the principles of individual rights and

[2] Our national motto, *E Pluribus Unum*, "from many, one," was originally conceived to denote the union of the thirteen states into one nation. Throughout our history, *E Pluribus Unum* has also come to mean the vital unity of our national community founded on individual freedom and the diversity that flows from it.

equal protection under the law, notions that now apply to all our residents. We have long recognized that immigrants are entitled to the full protection of our Constitution and laws. And, the U.S. has the sovereign right to impose obligations on immigrants.

Americanization is the process of integration by which immigrants become part of our communities and by which our communities and the nation learn from and adapt to their presence.

In our 1995 report to Congress, the Commission called for a new commitment to Americanization. In a public speech that same year, Barbara Jordan, our late chair, noted: "That word earned a bad reputation when it was stolen by racists and xenophobes in the 1920s. But it is our word, and we are taking it back." Americanization is the process of integration by which immigrants become part of our communities and by which our communities and the nation learn from and adapt to their presence. Americanization means the civic incorporation of immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy, and equal opportunity.

The Commission proposes that the principles of Americanization be made more explicit through the covenant between immigrant and nation. Immigrants become part of us, and we grow and become all the stronger for having embraced them. In this spirit, the Commission sees the covenant as:

Voluntary. Immigration to the United States—a benefit to both citizens and immigrants—is not an entitlement and Americanization cannot be forced.

Mutual and Reciprocal. Immigration presents mutual obligations. Immigrants must accept the obligations we impose—to obey our laws, to pay taxes, to respect other cultures and ethnic groups. At the same time, citizens incur obligations to provide an environment in which newcomers can become fully participating members of our society.

Individual, Not Collective. The United States is a nation

founded on the proposition that each individual is born with certain rights and that the purpose of government is to secure these rights. The United States admits immigrants as individuals (or individual members of families). As long as the United States continues to emphasize the rights of individuals over those of groups, we need not fear that the diversity brought by immigration will lead to ethnic division or disunity.

To help achieve full integration of newcomers, the Commission calls upon federal, state, and local governments to provide renewed leadership and resources to a program to promote Americanization that requires:

- Developing capacities to orient both newcomers and receiving communities;
- Educating newcomers in English language skills and our core civic values; and
- Revisiting the meaning and conferral of citizenship to ensure the integrity of the naturalization process.

ORIENTATION

The Commission recommends that the federal, state, and local governments take an active role in helping newcomers become self-reliant: orienting immigrants and receiving communities as to their mutual rights and responsibilities, providing information they need for successful integration, and encouraging the development of local capacities to mediate when divisions occur between groups. Information and orientation should be provided both to immigrants and to their receiving communities.

Information and orientation should be provided both to immigrants and to their receiving communities.

The Commission believes the federal government should help immigrants and local communities by:

- **Giving orientation materials to legal immigrants upon admission** that include, but are not limited to: a welcoming greeting; a brief discussion of U.S. history, law, and principles of U.S. democracy; tools to help the immigrant locate and use services for which they are eligible; and other immigration-related information and documents. All immigrants would receive the same materials. The packets would be available in English and other dominant immigrant languages.

- **Encouraging state governments to establish information clearinghouses in major immigrant receiving communities.** The Commission recommends that the federal government provide modest incentive grants to states to encourage them to establish and maintain local resources that would provide information to immigrants and local communities.

- **Promoting public/private partnerships to orient and assist immigrants in adapting to life in the United States.** While the federal government makes the decisions about how many and which immigrants will be admitted to the United States, the actual process of integration takes place in local communities. Local government, schools, businesses, charities, foundations, religious institutions, ethnic associations, and other groups play important roles in the Americanization process.

EDUCATION

Education is the principal tool of Americanization. Local educational institutions have the primary responsibility for educating im-

migrants. However, there is a federal role in promoting and funding English language acquisition and other academic and civic orientation for both immigrant children and adults.

The Commission urges a renewed commitment to the education of immigrant children. The number of school-aged children of immigrants is growing and expected to increase dramatically. These children, mostly young, speak more than 150 different languages; many have difficulty communicating in English. They are enrolled in public schools as well as in secular and religious private schools throughout the country. And, in addition to the problems other students have, they face particular problems in gaining an education— often because of language difficulties.

The Commission emphasizes that rapid acquisition of English should be the paramount goal of any immigrant language instruction program. English is the most critical of basic skills for successful integration. English can be taught to children in many ways. Effective programs share certain common characteristics. Based on a review of these programs, the Commission emphasizes the need for public and private educational programs to:

- **Conduct regular evaluations of students' English competence and their ability to apply it to academic subjects.** Such evaluations will ensure placement of immigrant children into regular English-speaking classes as soon as they are prepared. Regular evaluation also will highlight strengths and weaknesses in educational programs and provide insight on improvements that are needed to ensure timely English acquisition.

- **Collect and analyze data** on immigrant students, including their linguistic and academic performance and the efficacy of the instructional methods used in programs for immigrant children.

English is the most critical of basic skills for successful integration.

- **Include appropriate grade-level instruction in other academic disciplines.** Coordination with teachers, curricula, and instruction outside of English acquisition will promote students' mastery of regular subject matter while they expeditiously learn English.

- **Involve parents of immigrant students in their schooling.** A characteristic of many of the most successful language acquisition programs is the active involvement of parents in the education of their children.

The Commission encourages programs that are responsive to the needs of immigrant children and an orientation to United States school systems and the community**,** such as we have seen in "newcomer schools." Newcomer schools must not isolate immigrant newcomers. Instead, they must be transitional and actively promote the timely integration of students into mainstream schools.

The Commission recommends the revival and emphasis on instruction of all kindergarten through grade twelve students in the common civic culture that is essential to citizenship. An understanding of the history of the United States and the principles and practices of our government are an essential for all students, immigrants and natives alike. Americanization requires a renewed emphasis on the common core of civic culture that unites individuals from many ethnic and racial groups.

The Commission emphasizes the urgent need to recruit, train, and provide support to teachers who work with immigrant students. There is a disturbing shortage of qualified teachers for children with limited English proficiency, of teacher training programs for producing such teachers, and of other support for effective English acquisition instruction.

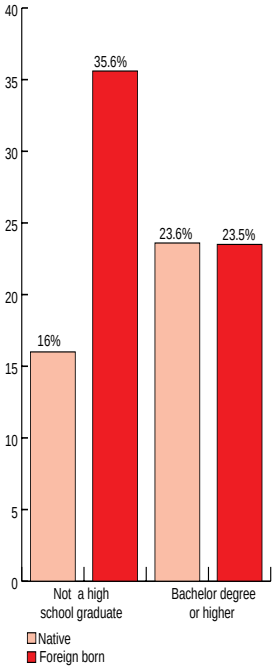
The Commission supports immigrant education funding that is based on a more accurate assessment of the impact of immigration on school systems and that is adequate to alleviate these impacts. There are costs and responsibilities for language acquisition and immigrant education programs that are not now being met. We urge the federal government to do its fair share in meeting this challenge. The long-term costs of failure in terms of dropouts and poorly educated adults will be far larger for the nation and local communities than the costs of such programs. More specifically, we urge the federal government to:

- **Provide flexibility in federal funding for the teaching of English to immigrant students to achieve maximum local choice of instructional model.** The federal government should not mandate any one mode of instruction (e.g., bilingual education, English as a second language programs, immersion).

- **Make funding contingent on performance outcomes—that is, English language acquisition and mastery of regular academic subject matter by students served in these programs.** School systems receiving funds because of large numbers of children with limited English proficiency and immigrant children should be held to rigorous performance standards. Federal and state funding incentives should promote—not impede—expeditious placement in regular, English-speaking classes.

The Commission urges the federal, state, and local governments and private institutions to enhance educational opportunities for adult immigrants. Education for basic skills and literacy in English is the major vehicle that integrates adult immigrants into American society and participation in its civic activities. Literate adults are more

EDUCATIONAL ATTAINMENT NATIVE AND FOREIGN-BORN RESIDENTS: 1996



Source: U.S. Bureau of the Census, *Current Population Survey*, March 1996.

likely to participate in the workforce and twice as likely to participate in our democracy. Literate adults foster literacy in their children, and parents' educational levels positively affect their children's academic performance.

Adult education is severely underfunded. Available resources are inadequate to meet the demand for adult immigrant education, particularly for English proficiency and job skills. In recognition of the benefits they receive from immigration, the Commission urges leaders from businesses and corporations to participate in skills training, English instruction, and civics education programs for immigrants. Religious schools and institutions, charities, foundations, community organizations, public and private schools, colleges and universities also can contribute resources, facilities, and expertise.

NATURALIZATION

Naturalization is the most important act that a legal immigrant undertakes in the process of becoming an American. Taking this step confers upon the immigrant all the rights and responsibilities of civic and political participation that the United States has to offer (except to become President). The naturalization process must be credible, and it must be accorded the formality and ceremony appropriate to its importance.

The naturalization process must be credible, and it must be accorded the formality and ceremony appropriate to its importance.

The Commission believes that the current legal requirements for naturalization are appropriate, but improvements are needed in the means used to measure whether an applicant meets these requirements. With regard to the specific legal requirements, the Commission supports:

- **Maintaining requirements that legal immigrants must reside in the United States for five years (three years for spouses of U.S. citizens and Lawful Permanent Residents**

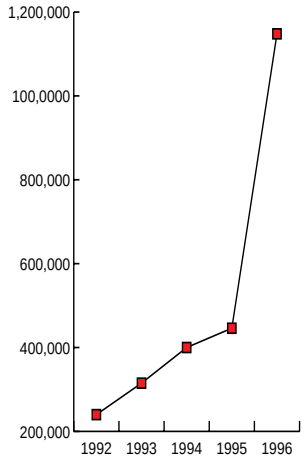
[LPRs] who serve in the military) before naturalizing. We believe five years is adequate for immigrants to embrace, understand, and demonstrate their knowledge of the principles of American democracy.

- **Improving the mechanisms used to demonstrate knowledge of U.S. history, civics, and English competence.** The Commission believes that the tests used in naturalization should seek to determine if applicants have a meaningful knowledge of U.S. history and civics and are able to communicate in English. The tests should be standardized and aim to evaluate a common core of information to be understood by all new citizens.

- **Expediting swearing-in ceremonies while maintaining their solemnity and dignity.** In districts where the federal court has exercised sole jurisdiction to conduct the swearing-in ceremonies, long delays often result from crowded court calendars. The Commission recommends that Congress restore the Executive Branch's sole jurisdiction for naturalization to reduce this waiting time. The Executive Branch should continue to work with federal judges as well as other qualified institutions, such as state courts and Immigration Judges, to ensure that swearing-in ceremonies are consistently conducted in a timely, efficient, and dignified manner.

- **Revising the naturalization oath to make it comprehensible, solemn, and meaningful.** The current oath is not easy to comprehend. We believe it is not widely understood by new citizens. Its wording includes dated language, archaic form, and convoluted grammar. The Commission proposes the following revision of the oath as capturing the essence of naturalization.

NATURALIZATION APPROVALS 1992-1996



Source: INS Statistical Office

Solemnly, freely, and
without any mental reservation,
I, [name] hereby renounce under oath
[or upon affirmation]
all former political allegiances.
My sole political fidelity
and allegiance from this day forward
is to the United States of America.
I pledge to support and respect
its Constitution and laws.
Where and if lawfully required,
I further commit myself to defend them against all enemies,
foreign and domestic, either by military or civilian service.
This I do solemnly swear [or affirm].

The Commission calls for urgently needed reforms to increase the efficiency and integrity of the naturalization process. The vast majority of applicants for naturalization are law-abiding immigrants who contribute to our society. The value of Americanization is eroded whenever unnecessary obstacles prevent eligible immigrants from becoming citizens. Its value also is undermined when the process permits the abuse of our laws by naturalizing applicants who are not entitled to citizenship.

Recognizing steps already are underway to reengineer the naturalization process, the Commission supports the following approaches:

- **Instituting efficiencies without sacrificing quality controls.** In the Commission's 1995 report to Congress, we recommended that the Immigration and Naturalization Service [INS] and the Congress take steps to expedite the processing of naturalization applications while maintaining

As under current regulations, new citizens will conclude the oath with the words "so help me God" unless, because of religious beliefs or by other reasons of conscience they choose to affirm their allegiance.

rigorous standards. Two years later, the naturalization process still takes too long, and previous efforts to expedite processing resulted in serious violations of the integrity of the system. Instituting a system that is both credible and efficient remains a pressing need.

- **Improving the integrity and processing of fingerprints.** The Commission believes that only service providers under direct control of the federal government should be authorized to take fingerprints. If the federal government does not take fingerprints itself but instead contracts with service providers, it must screen and monitor such providers rigorously for their capacity, capability, and integrity. Failure to meet standards would mean the contract would be terminated.

- **Contracting with a single English and civics testing service.** The Commission recommends that the federal government contract with one national and respected testing service to develop and administer the English and civics tests to naturalization applicants. Having one organization under contract should help the government substantially improve its oversight. Moreover, contracting with a highly-respected and nationally-recognized testing service will help ensure a high-quality product.

- **Increasing professionalism**. While many naturalization staff are highly professional in carrying out their duties, reports from district offices, congressional hearings, and complaints from naturalization applicants demonstrate continued dissatisfaction with the quality of naturalization services. Recruitment and training of longer-term staff assigned to adjudicating applications and overseeing quality control would help overcome some of these problems.

- **Improving automation.** The Commission is encouraged by

The value of Americanization is eroded whenever unnecessary obstacles prevent eligible immigrants from becoming citizens.

plans to develop linkages among data sources related to naturalization. The Commission recommends continued funding for an up-to-date, advanced, electronic automation system for information entry and recordkeeping.

- **Establishing clear fee-waiver guidelines and implementing them consistently.** Under current law, the Attorney General is authorized to grant fee waivers to naturalization applicants. The Commission has received accounts of legitimate requests being denied. Clear guidelines and consistent implementation are needed to ensure that *bona fide* requests are granted, while guarding against abuse.

A CREDIBLE FRAMEWORK FOR IMMIGRATION POLICY

In our previous reports, the Commission defined a credible immigration policy "by a simple yardstick: people who should get in do get in, people who should not get in are kept out; and people who are judged deportable are required to leave." By these measures, we have made substantial, but incomplete, progress. What follows are the Commission's recommendations for comprehensive reform to achieve more fully a credible framework for immigration policy.

LEGAL PERMANENT ADMISSIONS

The Commission reiterates its support for a properly-regulated system for admitting lawful permanent residents.[3] Research and analyses conducted since the issuance of the Commission's report

[3] For a full explanation of the Commission's recommendations see *Legal Immigration: Setting Priorities*, 1995. See Appendix for summary of Commissioner Leiden's dissenting statement.

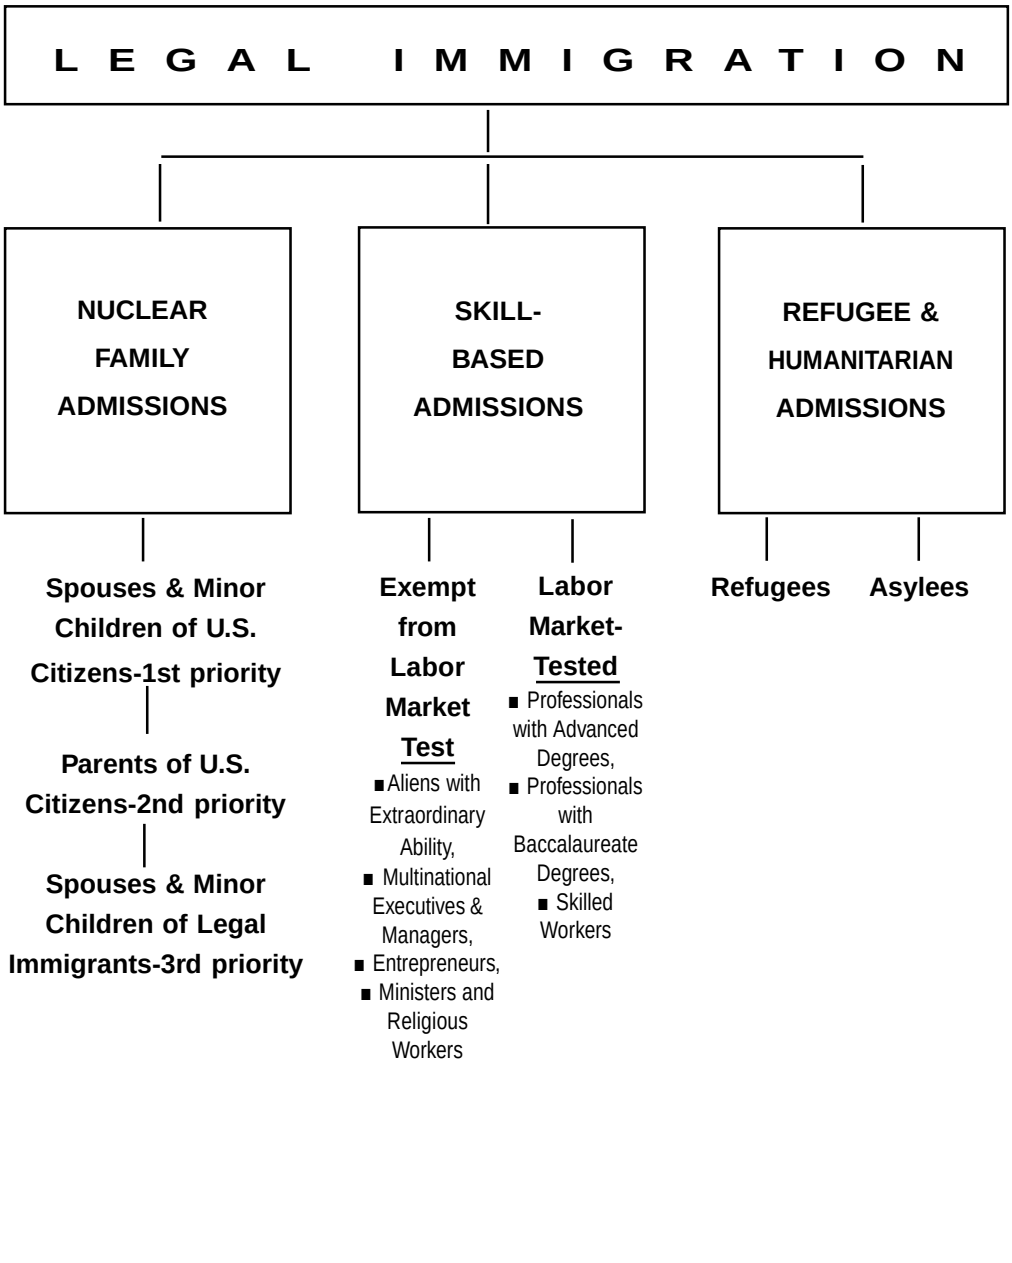
on legal immigration support our view that a properly-regulated system of legal permanent admissions serves the national interest. The Commission urges reforms in our legal immigration system to enhance the benefits accruing from the entry of newcomers while guarding against harms, particularly to the most vulnerable of U.S. residents—those who are themselves unskilled and living in poverty. More specifically, the Commission reiterates its support for:

A properly-regulated system of legal permanent admissions serves the national interest.

- **A significant redefinition of priorities and reallocation of existing admission numbers to fulfill more effectively the objectives of our immigration policy.** The current framework for legal immigration—family, skills, and humanitarian admissions—makes sense. However, the statutory and regulatory priorities and procedures for admissions do not adequately support the stated intentions of legal immigration—to reunify families, to provide employers an opportunity to recruit foreign workers to meet labor needs, and to respond to humanitarian crises around the world. During the two years since our report on legal immigration, the problems in the legal admission system have not been solved. Indeed, some of them have worsened.

  Current immigration levels should be sustained for the next several years while the U.S. revamps its legal immigration system and shifts the priorities for admission away from the extended family and toward the nuclear family and away from the unskilled and toward the higher-skilled immigrant. Thereafter, modest reductions in levels of immigration —to about 550,000 per year, comparable to those of the 1980s—will result from the changed priority system. The Commission continues to believe that legal admission numbers should be authorized by Congress for a specified time (e.g., three to five years) to ensure regular, periodic review and, if needed, change by Congress. This review should consider the ad-

Proposed Tripartite Immigration System



equacy of admission numbers for accomplishing priorities.

- **Family-based admissions that give priority to nuclear family members—spouses and minor children of U.S. citizens, parents of U.S. citizens, and spouses and minor children of lawful permanent residents—and include a backlog clearance program to permit the most expeditious entry of the spouses and minor children of LPRs.** The Commission recommends allocation of 550,000 family-based admission numbers each year until the large backlog of spouses and minor children is cleared. Numbers going to lower priority categories (e.g., adult children, siblings, and diversity immigrants), should be transferred to the nuclear family categories. Thereafter Congress should set sufficient admission numbers to permit all spouses and minor children to enter expeditiously.

  Since the Commission first reported its findings on legal admission, the problems associated with family-based admissions have grown. In 1995, the wait between application and admission of the spouses and minor children of LPRs was approximately three years. It is now more than four and one-half years and still growing. Moreover, various statutory changes made in 1996 make it all the more important that Congress take specific action to clear the backlog quickly to regularize the status of the spouses and minor children of legal permanent residents in the United States. In an effort to deter illegal migration, Congress expanded the bases and number of grounds upon which persons may be denied legal status because of a previous illegal entry or overstay of a visa. An unknown, but believed to be large, number of spouses and minor children of LPRs awaiting legal status are unlawfully present in the United States. While the Commission does not condone their illegal presence, we

are cognizant of the great difficulties posed by the long waiting period for a family second preference visa.

- **Skill-based admissions policies that enhance opportunities for the entry of highly-skilled immigrants, particularly those with advanced degrees, and eliminate the category for admission of unskilled workers.** The Commission continues to recommend that immigrants be chosen on the basis of the skills they contribute to the U.S. economy. Only if there is a compelling national interest—such as nuclear family reunification or humanitarian admissions—should immigrants be admitted without regard to the economic contributions they can make.

  Research shows that education plays a major role in determining the impacts of immigration. Immigration of unskilled immigrants comes at a cost to unskilled U.S. workers, particularly established immigrants for whom new immigrants are economic substitutes. Further, the difference in estimated lifetime fiscal effects of immigrants by education is striking: using the same methodology to estimate net costs and benefits, immigrants with a high school education or more are found to be net contributors while those without a high school degree continue to be net costs to taxpayers throughout their lifetime.[4]

  The Commission also continues to recommend changes in the procedures used in testing the labor market impact of employment-based admissions. Rather than use the lengthy, costly, and bureaucratic labor certification system, the Commission recommends using market forces as a labor market test. To ensure a level playing field for U.S. workers, em-

[4] National Research Council. 1997. *The New Americans: Economic, Demographic, and Fiscal Effects of Immigration*. Washington, DC: National Academy Press.

ployers would attest to having taken appropriate steps to recruit U.S. workers, paying the prevailing wage, and complying with other labor standards. Businesses recruiting foreign workers also would be required to make significant financial investments in certified private sector initiatives dedicated to improving the competitiveness of U.S. workers. These payments should be set at a per worker amount sufficient to ensure there is no financial incentive to hire a foreign worker over a qualified U.S. worker.

- **Refugee admissions based on human rights and humanitarian considerations, as one of several elements of U.S. leadership in assisting and protecting the world's persecuted.**[5] Since its very beginnings, the United States has been a place of refuge. The Commission believes continued admission of refugees sustains our humanitarian commitment to provide safety to the persecuted, enables the U.S. to pursue foreign policy interests in promoting human rights, and encourages international efforts to resettle persons requiring rescue or durable solutions. The Commission also urges the federal government to continue to support international assistance and protection for the majority of the world's refugees for whom resettlement is neither appropriate nor practical.

The Commission continues to recommend against denying benefits to legal immigrants solely because they are noncitizens. The Commission believes that the denial of safety net programs to immigrants solely because they are noncitizens is not in the national interest. In our 1994 and 1995 reports, the Commission argued that Congress should address the most significant uses of public benefit programs —particularly, elderly immigrants using Supplementary

[5] For a full explanation of the Commission's refugee-related recommendations, see *U.S. Refugee Policy: Taking Leadership*, 1997.

Security Income— by requiring sponsors to assume full financial responsibility for newly-arriving immigrants who otherwise would be excluded on public charge grounds. In particular, the Commission argued that sponsors of parents who would likely become public charges assume the responsibility for the lifetimes of the immigrants (or until they became eligible for Social Security on the basis of work quarters). We also argued that sponsors of spouses and children should assume responsibility for the duration of the familial relationship or a time-specified period. We continue to believe that this targeted approach makes greater sense than a blanket denial of eligibility for public services based solely on a person's alienage.

Persons admitted for limited duration stays help to enhance our scientific, cultural, educational, and economic strength.

LIMITED DURATION ADMISSIONS

Persons come to the United States for limited duration stays for several principal purposes: representation of a foreign government or other foreign entities; work; study; and short-term visits for commercial or personal purposes, such as tourism and family visits. These individuals are statutorily referred to as "nonimmigrants." In this report, however, we refer to "limited duration admissions [LDAs]," a term that better captures the nature of their admission: When the original admission expires, the alien must either leave the country or meet the criteria for a new LDA or permanent residence.

For the most part LDAs help enhance our scientific, cultural, educational, and economic strength. However, the admission of LDAs is not without costs and, as explained below, certain reforms are needed to make the system even more advantageous for the United States than it now is.

The Commission believes LDA policy should rest on the following principles:

- Clear goals and priorities;

Limited Duration Admissions and Visa Issuances

Class of Admission	Admissions (Entries) 1996	Visa Issuances 1996
All classes*	24,842,503	6,237,870
Foreign government officials (& families) (A)	118,157	78,078
Temporary visitors for business and pleasure (B1,B2)	22,880,270	4,947,899
Transit aliens (C)	325,538	186,556
Treaty traders and investors (& families) (E)	138,568	29,909
Students (F1, M1)	426,903	247,432
Students' spouses/children (F2, M2)	32,485	21,518
Representatives (& families) to international organizations (G)	79,528	30,258
Temporary workers and trainees	227,440	81,531
Specialty occupations (H-1B)	144,458	58,327
Performing services unavailable (H2)	23,980	23,204
Agricultural workers (H-2A)	9,635	11,004
Unskilled workers (H-2B)	14,345	12,200
Workers with extraordinary ability (O1, O2)	9,289	4,359
Internationally recognized athletes or entertainers (P1, P2, P3)	33,633	23,885
Exchange & religious workers (Q1, R1)	11,048	5,946
Spouses/children of temporary workers and trainees (H4, O3, P4, R2)	53,572	38,496
Exchange visitors (J1)	215,475	171,164
Spouses/children of exchange visitors (J2)	41,250	33,068
Intracompany transferees (L1)	140,457	32,098
Spouses/children of transferees (L2)	73,305	37,617

Sources: Admissions: U.S. Immigration and Naturalization Service statistical division. Visa Issuances: U.S. Department of State. 1996. *Report of the Visa Office, 1996.* Washington, DC: DOS, Bureau of Consular Affairs.

*Categories may not equal total because of omitted categories (e.g., fiancé(e)s of U.S. citizens, overlapping Canadian Free Trade Agreement professionals, unknown, NATO officials and professionals, and foreign media).

- Systematic and comprehensible organization of LDA categories;

- Timeliness, efficiency, and flexibility in its implementation;

- Compliance with the conditions for entry and exit (and effective mechanisms to monitor and enforce this compliance);

- Credible and realistic policies governing transition from LDA to permanent immigration status;

- Protection of U.S. workers from unfair competition and of foreign workers from exploitation and abuse; and

- Appropriate attention to LDA provisions in trade negotiations to ensure future immigration reforms are not unknowingly foreclosed.

The Commission recommends a reorganization of the visa categories for limited duration stays in the United States to make them more coherent and understandable. The Commission recommends that the current proliferation of visa categories be restructured into five broad groups: official representatives; foreign workers; students; short-term visitors; and transitional family members. This reorganization reflects such shared characteristics of different visa categories as entry for like reasons, similarity in testing for eligibility, and similar duration of stay in the United States.

The definitions and objectives of the five limited duration visa classifications would be:[6]

- **Official representatives** are diplomats, representatives of or to international organizations, representatives of NATO or NATO forces, and their accompanying family members. The

objective of this category is to permit the United States to admit temporarily individuals who represent their governments or international organizations.

- **Short-term visitors** come to the United States for commercial or personal purposes. In 1995 alone, millions of inbound visitors from other countries spent $76 billion on travel to and in the United States (on U.S. flag carriers, lodging, food, gifts, and entertainment).

- **Foreign workers** are those who are coming to perform necessary services for prescribed periods of time, at the expiration of which they must either return to their home countries or, if an employer or family member petitions successfully, adjust to permanent residence. This category would serve the labor needs demonstrated by U.S. businesses, with appropriate provisions to protect U.S. workers from unfair competition.

- **Students** are persons who are in the United States for the purpose of acquiring either academic or practical knowledge of a subject matter. This category has four major goals: to provide foreign nationals with opportunities to obtain knowledge they can take back to their home countries; to give U.S. schools access to a global pool of talented stu-

[6] The current system includes the J visa for cultural exchange, which is used for a variety of purposes, ranging from short-term visits to study and work. The workers include scholars and researchers, camp counselors, *au pairs*, and various others. Some work activities under the J visa demonstrate a clear cultural or education exchange; other work activities appear only tangentially related to the program's original purposes. Protection of U.S. workers by labor market tests and standards should apply to the latter group in the same manner as similarly situated temporary workers in other LDA categories. The Department of State should assess how better to fulfill the purpose of the Mutual Educational and Cultural Exchange Act of 1961 [Fulbright-Hays Act]. Such an analysis is particularly timely in light of the merger now being implemented between the Department of State and the United States Information Agency, which is responsible for administering the J visa.

dents; to permit the sharing of U.S. values and institutions with individuals from other countries; and to enhance the education of U.S. students by exposing them to foreign students and their cultures.

- **Transitional family members** include fiancé(e)s of U.S. citizens. These individuals differ from other LDAs because they are processed for immigrant status, although they do not receive such status until they marry in the U.S. and adjust. The Commission believes another category of transitional family members should be added: spouses of U.S. citizens whose weddings occur overseas but who subsequently come to the U.S. to reside.

Short-term Visitors

The Commission recommends that the current visa waiver pilot program for short-term business and tourist visits be made permanent upon the implementation of an entry-exit control system capable of measuring overstay rates. A permanent visa waiver system requires appropriate provisions to expand the number of participating countries and clear and timely means for removing those countries that fail to meet the high standards reserved for this privilege. Congress should extend the pilot three years while the control system is implemented.

Foreign Workers

Each year, more foreign workers enter the United States as LDAs for temporary work than enter as skill-based immigrants. In FY 1996, the Department of State issued almost 278,000 limited duration worker visas, including those for spouses and children. By contrast, only 118,000 immigrant visa issuances and domestic ad-

justments of status in worker categories were recorded in FY 1996, far less than the legislated limit of 140,000.

The Commission recommends that the limited duration admission classification for foreign workers include three principal categories: those who, for significant and specific policy reasons, should be exempt by law from labor market protection standards; those whose admission is governed by treaty obligations; and those whose admission must adhere to specified labor market protection ***standards.*** Under this recommendation, LDA worker categories are organized around the same principles that guide permanent worker categories. Accordingly, the Commission proposes different subcategories with labor market protection standards commensurate with the risks to U.S. workers we believe are posed by the foreign workers.

- **Those exempt by law from labor market protection standards** because their admission will generate substantial economic growth and/or significantly enhance U.S. intellectual and cultural strength and pose little potential for undermining the employment prospects and remuneration of U.S. workers. These include:

  Individuals of extraordinary ability in the sciences, arts, education, business, or athletics, demonstrated through sustained national or international acclaim and recognized for extraordinary achievements in their field of expertise.

  Managers and executives of international businesses. The global competitiveness of U.S. businesses is enhanced by the capacity of multinational corporations to move their senior staff around the world as needed.

  Professors, researchers and scholars whose salary or other compensation is paid by their home government, home institu-

tion, or the U.S. government in a special program for foreign professors, researchers, and scholars.

Religious workers, including ministers of religion and professionals and other workers employed by religious nonprofit organizations in the U.S. to perform religious vocations and religious occupations.

Members of the foreign media admitted under reciprocal agreements. The U.S. benefits from the presence of members of the foreign media who help people in their countries understand events in the United States. Just as we would not want our media to be overly regulated by labor policies of foreign governments, the United States extends the same courtesy to foreign journalists working in the U.S.

- **Foreign workers whose admission is subject to treaty obligations.** This includes treaty traders, treaty investors, and other workers entering under specific treaties between the U.S. and the foreign nation of which the alien is a citizen or national. Under the provisions of NAFTA, for example, Canadian professionals are not subject to numerical limits or labor market testing; Mexican professionals continue to be subject to labor market tests, but will be exempt from numerical limits in 2003.

- **Foreign workers subject by law to labor market protection standards**. These are principally:

  Professionals and other workers who are sought by employers because of their highly-specialized skills or knowledge and/or extensive experience. Included in this category are employees of international businesses who have specialized knowledge but are not managers or executives.

Trainees admitted to the United States for practical, on-the-job training in a variety of occupations. Trainees work in U.S. institutions as an integral part of their training program.

Artists, musicians, entertainers, athletes, fashion models, and participants in international cultural groups that share the history, culture, and traditions of their country.

Lesser-skilled and unskilled workers coming for seasonal or other short-term employment. Such worker programs warrant strict review, as described below. The Commission remains opposed to implementation of a large-scale program for temporary admission of lesser-skilled and unskilled workers.

The Commission recommends that the labor market tests used in admitting temporary workers in this category be commensurate with the skill level and experience of the worker.

- **Employers requesting the admission of temporary workers with highly-specialized skills or extensive experience should meet specific requirements**. Admission should be contingent on an attestation that:

  The employer will pay the greater of actual or prevailing wage and fringe benefits paid to other employees with similar experience and qualifications for the specific employment in question. Actual wage rates should be defined in a simple and straightforward manner.

  The employer has posted notice of the hire, informed coworkers at the principal place of business at which the LDA worker is employed, and provided a copy of the attestation to the LDA worker.

The employer has paid a reasonable user fee that will be dedicated to facilitating the processing of applications and the costs of auditing compliance with all requirements.

There is no strike or lockout in the course of a labor dispute involving the occupational classification at the place of employment.

The employer has not dismissed, except for cause, or otherwise displaced workers in the specific job for which the alien worker is hired during the previous six months. Further, the employer will not displace or lay off, except for cause, U.S. workers in the specific job during the ninety-day period following the filing of an application or the ninety-day periods preceding or following the filing of any visa petition supported by the application.

The employer will provide working conditions for such temporary workers that are comparable to those provided to similarly situated U.S. workers.

- **Certain at-risk employers of skilled workers (described** below) should be required to attest to having taken significant steps—for example, recruitment or training—to **employ U.S. workers in the jobs for which they are recruiting foreign workers.** We do not recommend, however, that current labor certification processes be used to document significant efforts to recruit. These procedures are costly, time consuming, and ultimately ineffective in protecting highly-skilled U.S. workers.

- **Employers requesting the admission of lesser-skilled workers should be required to meet a stricter labor market protection test.** Such employers should continue to be required to demonstrate that they have sought, but were unable to

find, sufficient American workers prepared to work under favorable wages, benefits, and working conditions. They also should be required to specify the plans they are taking to recruit and retain U.S. workers, as well as their plans to reduce dependence on foreign labor through hiring of U.S. workers or other means. Employers should continue to be required to pay the highest of prevailing, minimum, or adverse wage rates, provide return transportation, and offer decent housing, health care, and other benefits appropriate for seasonal employees.

The Commission recommends that categories of employers who are at special risk of violating labor market protection standards —regardless of the education, skill, or experience level of its employees—be required to obtain regular, independently-conducted audits of their compliance with the attestations made about labor market protection standards, with the results of such audit being submitted for Department of Labor review. Certain businesses, as described below, pose greater risk than others of displacing U.S. workers and/or exploiting foreign workers. The risk factors that should be considered in determining whether regular audit requirements must apply include:

- **The employer's extensive use of temporary foreign workers.** Extensive use can be defined by the percentage of the employer's workforce that is comprised of LDA workers. It also can be measured by the duration and frequency of the employer's use of temporary foreign workers.

- **The employer's history of employing temporary foreign workers.** Those employers with a history of serious violations of regular labor market protection standards or of specific labor standards related to the employment of LDA workers should be considered as at risk for future violations.

- **The employer's status as a job contracting or employment agency providing temporary foreign labor to other employers.** Risk of labor violations increases as responsibility is divided between a primary and secondary employer.

To ensure adequate protection of labor market standards, such employers should be required to submit an independent audit of their compliance with all statements attested to in their application. The independent audits should be done by recognized accounting firms that have the demonstrated capacity to determine, for example, that wages and fringe benefits were provided as promised in the attestation and conformed to the actual or prevailing wages and fringe benefits provided to similarly situated U.S. workers.

The Commission recommends enhanced monitoring of and enforcement against fraudulent applications and postadmission violations of labor market protection standards. To function effectively, both the exempt and nonexempt temporary worker programs must provide expeditious access to needed labor. The Commission's recommendations build on the current system of employer attestations that receive expeditious preapproval review but are subject to postapproval enforcement actions against violators. More specifically, the Commission recommends:

- **Allocating increased staff and resources to the agencies responsible for adjudicating applications for admission and monitoring and taking appropriate enforcement action against fraudulent applications and violations of labor market protection standards.** Increased costs required for more efficient adjudication of applications can be covered by applicant fees. However, additional costs incurred for more effective investigations of compliance with labor market standards will require appropriated funds.

- **Barring the use of LDA workers by any employer who has been found to have committed willful and serious labor**

standards violations with respect to the employment of LDA workers. Further, upon the recommendation of any federal, state, or local tax agency, barring the use of LDA workers by any employer who has been found to have committed willful and serious payroll tax violations with respect to LDA workers. The law currently provides for such debarment for failure to meet labor condition attestation provisions or misrepresentation of material facts on the application. Implementation of this recommendation would enable penalties to be assessed for serious labor standards violations that are not also violations of the attestations.

- **Developing an enforcement strategy to reduce evasion of the LDA labor market protection standards through contractors.** U.S. businesses' growth in contracting-out functions has raised questions of employment relationships and ultimate liability for employment-related violations, including those related to temporary foreign workers. A uniform policy for dealing with these situations is desirable for the enforcement agencies involved, as well as for employers, contractors, and workers.

CURBING UNLAWFUL MIGRATION

In its first interim report to Congress , the Commission recommended a comprehensive strategy to curb unlawful migration into the United States through prevention and removal.[7] Despite the additional resources, new policies, and often innovative strategies adopted during the past few years, illegal migration continues to be a problem. The Commission continues to believe that unlawful immigration can be curtailed consistent with our traditions, civil rights, and civil liberties. As a nation committed to the rule of law, our immi-

[7] For a full explanation of the Commission's recommendations see: *U.S. Immigration Policy: Restoring Credibility*, 1994.

Unlawful immigration can be controlled consistent with our traditions, civil rights, and civil liberties.

gration policies must conform to the highest standards of integrity and efficiency in the enforcement of the law. We must also respect due process.

Deterrence Strategies

The Commission reiterates its 1994 recommendations supporting a comprehensive strategy to deter illegal migration. More specifically, the Commission continues to support implementation of the following deterrence strategies:

- **An effective border management policy that accomplishes the twin goals of preventing illegal entries and facilitating legal ones.** New resources for additional Border Patrol officers, inspectors, and operational support, combined with such new strategies as operations "Hold the Line," "Gatekeeper," and "Safeguard," have improved significantly the management of the border where they are deployed. The very success of these new efforts demonstrates that to gain full control, the same level of resources and prevention strategies must be deployed at all points on the border where significant violations of U.S. immigration law are likely to occur.

- **Reducing the employment magnet is the linchpin of a comprehensive strategy to deter unlawful migration.** Economic opportunity and the prospect of employment remain the most important draw for illegal migration to this country. Strategies to deter unlawful entries and visa overstays require both a reliable process for verifying authorization to work and an enforcement capacity to ensure that employers

adhere to all immigration-related labor standards. The Commission supports implementation of pilot programs to test what we believe is the most promising option for verifying work authorization: a computerized registry based on the social security number.[8]

- **Restricting eligibility of illegal aliens for publicly-funded services or assistance, except those made available on an emergency basis or for similar compelling reasons to protect public health and safety or to conform to constitutional requirements.** Although public benefit programs do not appear to be a major magnet for illegal migrants, it is important that U.S. benefit eligibility policies send the same message as immigration policy: Illegal aliens should not be here and, therefore, should not receive assistance, except in unusual circumstances. The Commission recommended drawing a line between illegal aliens and lawfully resident legal immigrants with regard to benefits eligibility, in part to reinforce this message. We continue to believe that this demarcation between legal and illegal aliens makes sense. The Commission urges the Congress to reconsider the changes in welfare policy enacted in 1996 that blur the distinctions between legal and illegal aliens by treating them similarly for the purposes of many public benefit programs.

- **Strategies for addressing the causes of unlawful migration in source countries.** An effective strategy to curb unauthorized movements includes cooperative efforts with source countries to address the push factors that cause people to seek new lives in the United States. The Commission continues to urge the United States government to give priority in its foreign policy and international economic policy to

[9] For a fuller discussion of the Commission's recommendation on mass migration emergencies, see *U.S. Refugee Policy: Taking Leadership*, 1997.

long-term reduction in the causes of unauthorized migration.

- **Mechanisms to respond in a timely, effective, and humane manner to migration emergencies.** A credible immigration policy requires the ability to respond effectively and humanely to migration emergencies in which large numbers of people seek entry into the United States. These emergencies generally include *bona fide* refugees, other individuals with need for protection, and persons seeking a better economic life in the U.S. Failure to act appropriately and in a timely manner to determine who should be admitted and who should be returned can have profound humanitarian consequences. Further, an uncontrolled emergency can overwhelm resources and create serious problems that far outlast the emergency.[9]

Removals

A credible immigration system requires the effective and timely removal of aliens who can be determined through constitutionally-sound procedures to have no right to remain in the United States. If unlawful aliens believe that they can remain indefinitely once they are within our national borders, there will be increased incentives to try to enter or remain illegally.

Our current removal system does not work. Hundreds of thousands of aliens with final removal orders remain in the U.S. The system's ineffectiveness results from a fragmented, uncoordinated approach, rather than flawed legal procedures. The Executive Branch does not have the capacity, resources, or strategy to detain aliens likely to abscond, to monitor the whereabouts of released aliens, or to remove them.

The Commission urges immediate reforms to improve management of the removal system and ensure that aliens with final orders of deportation, exclusion, or removal are indeed removed from the United States. Establishing a more effective removal system requires changes in the management of the removal process. More specifically, the Commission recommends:

- **Establishing priorities and numerical targets for the removal of criminal *and* noncriminal aliens.** The Commission encourages headquarters, regional, and local immigration enforcement officials to set these priorities and numerical goals.

- **Local oversight and accountability for the development and implementation of plans to coordinate apprehensions, detention, hearings, removal, and the prevention of reentry.** With guidance on priorities, local managers in charge of the removal system would be responsible for allocation of resources to ensure that aliens in the prioritized categories are placed in the system and ultimately removed. Local managers also would be responsible and accountable for identifying effective deterrents that reduce the likelihood that removed aliens would attempt to reenter the U.S.

- **Continued attention to improved means for identifying and removing criminal aliens with a final order of deportation.** The Commission reiterates the importance of removing criminal aliens as a top priority. Our recommendation regarding the importance of removing noncriminal aliens with final orders is not intended to shift the attention of the removal system away from this priority. Rather, both criminal and noncriminal aliens must be removed to protect public safety (in the case of criminals) and to send a deterrent message (to *all* who have no permission to be here).

- **Legal rights and representation.** The Executive Branch should be authorized to develop, provide, and fund programs and services that educate aliens about their legal rights and immigration proceedings. Such programs also should encourage and facilitate legal representation where to do so would be beneficial to the system and the administration of justice. Particular attention should be focused on aliens in detention where release or removal can be expedited through such representation. Under this approach, the alien would not have a right to appointed counsel, but the government could fund services to address some of the barriers to representation.

- **Prosecutorial discretion to determine whether to proceed with cases.** Guidelines on the use of prosecutorial discretion should be developed, local Trial Attorneys trained, support staff provided, and discretion exercised with the goal of establishing a more efficient and rational hearing system. Trial attorneys should focus their efforts on trying cases that are likely to result in the removal of the alien upon completion of the proceedings.

- **Strategic use of detention and release decisions.** Detention space, always in limited supply, is in greater demand as the government has focused more on the removal of criminal aliens and as Congress mandates more categories to be detained. Detention needs to be used more strategically if removals are to be accomplished. Alternatives to detention should be developed so that detention space is used efficiently and effectively. The Commission fully supports the three-year pilot program, created with and implemented by the Vera Institute, to help define effective alternatives to detention for specific populations.

- **Improved detention conditions and monitoring.** Detention cannot be used effectively unless the conditions of detention are humane and detainees are free from physical abuse and harassment by guards. We have no doubt that appropriate criteria for all facilities can be promulgated, based on sound governmental judgment and consultation with concerned nongovernmental organizations. But most importantly, a system to monitor facilities on a regular basis must be developed. Inspections must occur more than once annually.

  Further, the Commission recommends that the Department of Justice consider placing administrative responsibility for operating detention centers with the Bureau of Prisons or U.S. Marshals Service. An immigration enforcement agency should not be shouldered with such a significant responsibility that is not part of its fundamental mission or expertise.

- **Improved data systems.** Current data systems are unable to link an apprehension to its final disposition (e.g., removal, adjustment of status). This significantly limits the use of apprehension and removal data for analytical purposes. The Commission urges development of data systems that link apprehensions and removals and provide statistics on individuals.

- **The redesigned removal system should be managed initially by a Last-In-First-Out [LIFO] strategy to demonstrate the credibility of the system.** Once a coherent system is organized and appropriate resources are assigned to removing deportable aliens—not simply to put aliens through proceedings—removals should proceed in a Last-In-First-Out mode. In this way, the government can send a credible

deterrent message to failed asylum seekers, visa overstayers, users of counterfeit documents, and unauthorized workers, that their presence in the United States will not be tolerated. Such a well-organized system can establish control over the current caseload and quickly prioritize the backlog for enforcement purposes. The deterrent effect of LIFO has been shown in the asylum system where new procedures were adopted in a LIFO mode.

The Commission urges Congress to clarify that the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 [IIRIRA] and the Antiterrorism and Effective Death Penalty Act of 1996 [AEDPA] do not apply retroactively to cases pending when the new policies and procedures went into effect. As a matter of policy, the Commission believes that retroactive application of new immigration laws undermines the effectiveness and credibility of the immigration system. Applying newly-enacted laws or rules in an immigration proceeding that has already commenced results in inefficiency in the administration of the immigration laws. It also can raise troubling issues of fairness. Finally, it invites confusion, adds uncertainty, and fosters a lack of trust and confidence in the rule of law.

ACHIEVING IMMIGRATION POLICY GOALS

INTRODUCTION

Restoring credibility and setting priorities—themes at the center of the Commission's policy recommendations on illegal and legal immigration, respectively—will not come to pass unless the government is structured to deliver on these policies. An effective immi-

gration system requires both credible policy and sound management. Good management cannot overcome bad policy. Poor structures, lack of professionalism, poor planning, and failure to set priorities will foil even the best policies.

Until relatively recently, the agencies responsible for implementing immigration policy were underfunded, understaffed, and neglected. During the past few years, however, massive increases in resources and personnel, combined with significant political attention to immigration issues, have provided new opportunities to address long-standing problems. A recent General Accounting Office [GAO] report documented improvements—including, for example, a more strategic approach to the formulation of immigration enforcement programs. The Commission has seen progress in many management areas—for example, more effective border management, increased numbers of criminal alien removals, and asylum reform that has deterred abusive claims while protecting *bona fide* refugees. Nevertheless, problems remain in the operation of the U.S. immigration and naturalization system. Further improvements must be made if it is to function smoothly and effectively, anticipating and addressing, rather than reacting to, problems.

An effective immigration system requires both credible policy and sound management.

STRUCTURAL REFORM

The Commission recommends fundamental restructuring of responsibilities within the federal government to support more effective management of the core functions of the immigration system: border and interior enforcement; enforcement of immigration-related employment standards; adjudication of ***immigration and naturalization applications; and consolidation of administrative appeals***. The immigration system is one of the most complicated in the federal government bureaucracy. In some cases, one agency has mul-

tiple, and sometimes conflicting, operational responsibilities. In other cases, multiple agencies have responsibility for elements of the same functions. Both situations create problems.

Mission Overload. Some of the agencies that implement the immigration laws have so many responsibilities that they have proved unable to manage all of them effectively. Between Congressional mandates and administrative determinations, these agencies must give equal weight to more priorities than any one agency can handle.

Proposed
U.S. Immigration System

AGENCY \ FUNCTION	IMMIGRATION ENFORCEMENT	IMMIGRATION BENEFITS	LABOR STANDARDS	APPEALS
DEPARTMENT OF JUSTICE Bureau for Immigration Enforcement	✓			
DEPARTMENT OF STATE Undersecretary for Citizenship, Immigration, and Refugee Admissions		✓		
DEPARTMENT OF LABOR Employment Standards Administration			✓	
AGENCY FOR IMMIGRATION REVIEW				✓

Such a system is set up for failure and, with such failure, further loss of public confidence in the immigration system.

No one agency is likely to have the capacity to accomplish all of the goals of immigration policy equally well. Immigration law enforcement requires staffing, training, resources, and a work culture that differs from what is required for effective adjudication of benefits or labor standards regulation of U.S. businesses.

Diffusion of Responsibilities Among Agencies. Responsibility for many immigration functions are spread across numerous agencies within single departments or between departments. For example, responsibility for making decisions on skill-based immigrant and LDA applications is dispersed among the Department of Labor [DOL], the Department of Justice's [DOJ] Immigration and Naturalization Service [INS], and the Department of State [DOS]. Responsibility for

Proposed Restructuring of the Immigration System

DEPARTMENT OF JUSTICE	DEPARTMENT OF STATE	DEPARTMENT OF LABOR	INDEPENDENT AGENCY

Immigration enforcement at the border and in the interior of the United States	Adjudication of eligibility for immigration, refugee and naturalization applications	Enforcement of immigration-related employment standards	Administrative review of all authorized immigration-related appeals

investigating employer compliance with immigration-related labor standards is shared by INS and DOL.

The Commission considered a range of ways to reorganize roles and responsibilities, including proposals to establish a Cabinet-level Department of Immigration Affairs. After examining the full range of options, the Commission concludes that a clear division of responsibility among existing federal agencies, with appropriate consolidation of functions, will improve management of the federal immigration system. As discussed below, ***the Commission recommends a restructuring of the immigration system's four principal operations as follows:***[10]

1. ***Immigration enforcement at the border and in the interior of the United States in a Bureau for Immigration Enforcement at the Department of Justice;***

2. ***Adjudication of eligibility for immigration-related applications (immigrant, limited duration admission, asylum, refugee, and naturalization) in the Department of State under the jurisdiction of an Undersecretary for Citizenship, Immigration, and Refugee Admissions;***

3. ***Enforcement of immigration-related employment standards in the Department of Labor; and***

4. ***Appeals of administrative decisions including hearings on removal, in an independent body, the Agency for Immigration Review.***

The Commission believes this streamlining and reconfiguring of responsibilities will help ensure: coherence and consistency in immigration-related law enforcement; a supportive environment for adjudication of applications for immigration, refugee, and citizenship services; rigorous enforcement of immigration-related labor stan-

dards to protect U.S. workers; and fair and impartial review of immigration decisions.

Bureau For Immigration Enforcement (DOJ)

The importance and complexity of the enforcement function within the U.S. immigration system necessitate the establishment of a higher-level, single-focus agency within the Department of Justice.

The Commission recommends placing all responsibility for enforcing United States immigration laws to deter future illegal entry and remove illegal aliens in a Bureau for Immigration Enforcement at the Department of Justice. The Commission believes that the importance and complexity of the enforcement function within the U.S. immigration system necessitate the establishment of a higher-level, single-focus agency within the DOJ. The Commission further recommends that the newly configured agency have the prominence and visibility that the Federal Bureau of Investigation [FBI] currently enjoys within the DOJ structure. The Director of the Bureau would be appointed for a set term (e.g., five years). The agency would be responsible for planning, implementing, managing, and evaluating all U.S. immigration enforcement activities both within the United States and overseas.

The Commission recommends the following distribution of responsibilities within the Bureau for Immigration Enforcement.

Uniformed Enforcement Officers. The Commission recommends merger of the INS Inspectors, Border Patrol, and detention officers into one unit, the Immigration Uniformed Service Branch. Its officers would be trained for duties at land, sea, and air ports of entry, between land ports on the border, and in the interior where uniformed officers are needed for enforcement.

Investigators. The Commission believes investigations will be a key part of the new agency's responsibility. Investigators are the main agents responsible for identifying and apprehending people who are

illegally residing or working in the United States, for deterring smuggling operations, for building a case against those who are not deterred, and for identifying, apprehending, and carrying out the removal of aliens with final enforceable orders of removal.

Intelligence. The Bureau will require an Intelligence Division to provide strategic assessments, training and expertise on fraud, information about smuggling networks, and tactical support to uniformed officers or investigators.

Assets Forfeiture Unit. As with the other DOJ enforcement agencies, the Bureau will have an Assets Forfeiture unit.

Pre- and Post-Trial "Probation" Officers. "Probation" functions are not now performed consistently or effectively, but the Commission believes this function is essential to more strategic use of detention space. As it is unlikely that all potentially deportable aliens could or should be detained awaiting removal, the Commission believes more attention should be given to supervised release programs and to sophisticated methods for tracking the whereabouts of those not detained.

Trial Attorneys/Prosecutors. The Commission believes that the Trial Attorneys, who in effect are the Government's immigration prosecutors, should be vested with, *and should utilize,* an important tool possessed by their criminal counterparts: prosecutorial discretion.

Field Offices. The new agency would implement its programs through a series of field offices that are structured to address comprehensively the immigration enforcement challenges of the particular locality. As the location of these offices should be driven by enforcement priorities, they are likely to be in different places than current district offices. Regional Offices could be retained for administrative and managerial oversight of these dispersed and diverse field offices.

Citizenship, Immigration, And Refugee Admissions (DOS)

The Commission recommends that all citizenship and immigration benefits adjudications be consolidated in the Department of State, and that an Undersecretary for Citizenship, Immigration, and Refugee Admissions be created to manage these activities. At present, three separate agencies—the INS, the Department of State, and the Department of Labor—play broad roles in adjudicating applications for legal immigration, limited duration admissions, refugee admissions, asylum, and/or citizenship. The Commission believes a more streamlined and accountable adjudication process, involving fewer agencies but greater safeguards, will result in faster and better determinations of these benefits. As in the current system, these services would be funded through fees paid by applicants and retained by the benefits offices for delivery of the services.

A more streamlined and accountable adjudication process, involving fewer agencies but greater safeguards, will result in faster and better determinations of immigration and citizenship benefits.

The Commission considered the advantages and disadvantages of consolidating responsibility in the Department of Justice and in the Department of State, the two agencies that already have the most significant immigration, refugee, and citizenship duties. Bearing in mind the dual problems the Commission identified in the current structures—mission overload and fragmentation of responsibility, we concluded that consolidation in the Department of State makes greater sense than creation of a new, separate benefits agency within the Department of Justice.

Taking responsibility for immigration and citizenship services out of the Department of Justice sends the right message, that legal immigration and naturalization are not principally law enforcement problems; they are opportunities for the nation as long as the services are properly regulated. Further, the Department of Justice does not have the capacity internationally to take on the many duties of the Department of State. The Department of State, however, already has a domestic presence and an adjudication capability. It issues one-

half million immigrant visas and six million nonimmigrant visas each year. DOS also provides a full range of citizenship services both domestically (issuance of almost 6 million passports annually) and abroad (e.g., citizenship determinations and registration of births of U.S. citizens overseas). Indeed, DOS has devoted a major share of its personnel and its capital and operating resources to these adjudicatory functions at embassies and consulates in more than two hundred countries and in passport offices in fifteen U.S. cities.

Consolidating responsibility requires some changes in the way the Department of State administers its immigration responsibilities, which we believe will strengthen the adjudication function. Because immigration has both foreign and domestic policy import, the Department of State will need to develop mechanisms for consultation with groups representing a broad range of views and interests regarding immigration. Such consultations already occur in the refugee program. The Department of State also will need to change its historic position on review of consular decisions. At present, decisions made at INS and the Department of Labor on many immigrant and LDA applications may be appealed, but no appeal is available on consular decisions. The Commission believes that immigrant and certain limited duration admission visas with a U.S. petitioner should be subject to independent administrative appeal (see below).

The Undersecretary, who would have direct access to the Secretary of State, would be responsible for domestic and overseas immigration, citizenship, and refugee functions. These include adjudication of applications for naturalization, determinations of citizenship overseas, all immigrant and limited duration admission petitions, work authorizations and other related permits, and adjustments of status. It also would have responsibility for refugee status determinations abroad and asylum claims at home. Overseas citizenship services would continue to be provided by consular officers abroad. The

agency would have enhanced capacity to detect, deter, and combat fraud and abuse among those applying for benefits.

Within the Office of the Undersecretary would be a unit responsible both for formulating and assessing immigration policy as well as reviewing and commenting on the immigration-related effects of foreign policy decisions. This policy capacity would be new for the Department of State, but it is in keeping with the important role that migration now plays in international relations.

The Undersecretary would have three principal operating bureaus:

A Bureau of Immigration Affairs would focus on the immigration process, as noted above, as well as on LDA processing. In addition to its existing overseas work, the Immigration Affairs Bureau would be responsible for domestic adjudication/examination functions, including work authorization, adjustment of status, domestic interviewing, and the issuance of appropriate documentation (e.g., green cards). The Immigration Affairs Bureau also would staff immigration information and adjudication offices in areas with immigrant concentrations.

A Bureau of Refugee Admissions and Asylum Affairs would assure an appropriate level of independence from routine immigration issues and processes. It would combine the present Bureau for Population, Refugees and Migration [PRM] responsibilities for overseas refugee admissions, the refugee and asylum offices of the INS, and the DOS asylum office in the Bureau of Democracy, Human Rights and Labor. This would integrate the key governmental offices in one of our most important and historic international activities.

A Bureau of Citizenship and Passport Affairs would be responsible for naturalization, other determinations of citizenship, and issuance of passports. Local offices performing some citizenship func-

tions, such as overseas travel information, passport and naturalization applications, testing and interviews, could be located with local immigration services.

Overseas citizen services would continue to be handled within the newly consolidated organization. These services include: responding to inquiries as to the welfare or whereabouts of U.S. citizens; assisting when U.S. citizens die, are arrested, or experience other emergencies abroad; providing notarial services; and making citizenship determinations and issuing passports abroad.

Quality Assurance Offices would oversee records management, monitoring procedures, fraud investigations, and internal review. At present, monitoring of the quality of decisions made on applications for immigration and citizenship benefits receives insufficient attention. The Commission believes that quality decisions require some form of internal supervisory review for applicants who believe their cases have been wrongly decided. This type of review helps an agency monitor consistency and identify problems in adjudication and offers a means of correcting errors. A staff responsible for and dedicated to ensuring the quality of decisions taken on applications for immigration and citizenship should address some of the weaknesses in the current system, such as those recently identified in the naturalization process.

With respect to the domestic field structure for implementing these programs, the Regional Service Centers [RSCs] and National Visa Center [NVC] would continue to be the locus of most adjudication. The physical plants are excellent and the locally-hired staffs are trained and in place. At this time, information is passed from the

[11] At present, DOL investigates employer compliance with the requirement to check documentation and fill out the I-9 form, while INS does this paperwork review and investigations of knowing hire of illegal aliens. The latter investigations are hampered, however, by the absence of an effective verification process and proliferation of fraudulent documents.

RSCs to the NVC when the applicant for admission is overseas. Overseas interviews would continue to take place at embassies and consulates.

A range of other interviews would take place domestically. Ideally, to avoid long lines and waits for service, there would be smaller offices in more locations that the current INS district offices. The Commission recommends against locating these offices with the enforcement offices discussed above. Asking individuals requesting benefits or information to go to an enforcement agency sends the wrong message about the U.S. view of legal immigration.

Immigration-related Employment Standards (DOL)

The Commission recommends that all responsibility for enforcement of immigration-related standards for employers be consolidated in the Department of Labor. These activities include enforcing compliance with requirements to verify work authorization and attestations made regarding conditions for the legal hire of temporary and permanent foreign workers. The Commission believes that as this is an issue of labor standards, the Department of Labor is the best equipped federal agency to regulate and investigate *employer compliance* with standards intended to protect U.S. workers. The hiring of unauthorized workers and the failure of employers to comply with the commitments they make (e.g., to pay prevailing wages, to have recruited U.S. workers) in obtaining legal permission to hire temporary and permanent foreign workers are violations of such labor standards. Enforcement of compliance with these requirements currently lies within the responsibility of both INS and DOL. Under consolidation, the DOL Employment Standards Administration's [ESA] Wage and Hour Division [WH] and Office of Federal Contract Compliance Programs [OFCCP] would perform these func-

The Department of Labor is the best equipped federal agency to regulate and investigate employer compliance with standards intended to protect U.S. workers.

tions in conjunction with their other worksite labor standards activities.

Sanctions Against Employers Who Fail to Verify Work Authorization. The Commission believes all worksite investigations to ascertain employers' compliance with employment eligibility verification requirements should be conducted by DOL. DOL already conducts many of these investigations. However, under this recommendation, DOL also would assess penalties if employers fail to verify the employment eligibility of persons being hired. DOL would not be required to prove that an employer knowingly hired an illegal worker, just that the employer hired a worker without verification of his or her authorization to work. With implementation of the Commission's proposal for a more effective verification process, this function will be critical to deterring the employment of unauthorized workers.[11]

Enforcement of Skill-Based Immigrant and Limited Duration Admissions Requirements. The Commission believes an expedited process is needed for the admission of both temporary and permanent foreign workers, as discussed earlier in this report, as long as adequate safeguards are in place to protect the wages and working conditions of U.S. workers. To prevent abuse of an expedited system, an effective postadmission enforcement scheme is necessary.

DOL's other worksite enforcement responsibilities place it in the best position to monitor employers' compliance with the attestations submitted in the admissions process. DOL investigators are experienced in examining employment records and interviewing employees. Penalties should be established for violations of the conditions to which the employer has attested, including payment of the appropriate wages and benefits, terms and conditions of employment, or any misrepresentation or material omissions in the attestation. Such penalties should include both the assessment of significant administrative fines as well as barring egregious or repeat vio-

lators from petitioning for the admission of permanent or temporary workers.

Agency For Immigration Review

The Commission recommends that administrative review of all immigration-related decisions be consolidated and be considered by a newly-created independent agency, the Agency for Immigration Review, within the Executive Branch. The Commission believes that a system of formal administrative review of immigration-related decisions—following internal supervisory review within the initial adjudicating body—is indispensable to the integrity and operation of the immigration system. Such review guards against incorrect and arbitrary decisions and promotes fairness, accountability, legal integrity, uniform legal interpretations, and consistency in the application of the law both in individual cases and across the system as a whole.

Not only is independence in decisionmaking the hallmark of meaningful and effective review, it is also critical to the reality and the perception of fair and impartial review.

The review function works best when it is well insulated from the initial adjudicatory function and when it is conducted by decisionmakers entrusted with the highest degree of independence. Not only is independence in decisionmaking the hallmark of meaningful and effective review, it is also critical to the reality and the perception of fair and impartial review.

Hence, the Commission recommends that the review function be conducted by a newly-created independent reviewing agency in the Executive Branch. To ensure that the new reviewing agency is independent and will exist permanently across Administrations, we believe it should be statutorily created. It would incorporate the activities now performed by several existing review bodies, including the DOJ Executive Office for Immigration Review, the INS Administrative Appeals Office, the DOL Board of Alien Labor Cer-

tification Appeals, and the DOS Board of Appellate Review. It also would have some new responsibilities.

This reviewing agency would be headed by a Director, a presidential appointee, who would coordinate the overall work of the agency, but would have no say in the substantive decisions reached on cases considered by any division or component within the agency.

There would be a trial division headed by a Chief Immigration Judge, appointed by the Director. The Chief Judge would oversee a corps of Immigration Judges sitting in immigration courts located around the country. The Immigration Judges would hear every type of case presently falling within the jurisdiction of the now-sitting Immigration Judges.

The reviewing agency also would consider appeals of decisions by the benefits adjudication agency, using staff with legal training. Although the benefits adjudication agency will handle a wide range of applications—from tourist visas to naturalization and the issuance of passports—not all determinations will be appealable, as is the case under current law. We envision that those matters that are appealable under current law would remain appealable. The only difference is that the appeal would be lodged with and considered by the new independent Agency for Immigration Review rather than by the various reviewing offices and Boards presently located among the several Departments. The administrative appeals agency also would consider appeals from certain visa denials and visa revocations by consular officers. Under current law, such decisions are not subject to formal administrative or judicial review. The Commission believes that consular decisions denying or revoking visas in specified visa categories—i.e., all immigrant visas and those LDA categories where there is a petitioner in the United States who is seeking the admission of the visa applicant—should be subject to formal administrative review. The visa applicant would have no

right to appeal an adverse determination. Instead, standing to appeal a visa denial or revocation would lie only with United States petitioners, whether U.S. citizens, lawful permanent residents, or employers.

An appellate Board would sit over the trial and administrative appeals divisions of the new independent Agency for Immigration Review. This appellate Board would be the highest administrative tribunal in the land on questions and interpretations of immigration law. It would designate selected decisions as precedents for publication and distribution to the public at large. Its decisions would be binding on all officers of the Executive Branch. To ensure the greatest degree of independence, decisions by the Board would be subject to reversal or modification only as a result of judicial review by the federal courts or through congressional action. Neither the Director of the reviewing agency nor any other agency or Department head could alter, modify, or reverse a decision by the appellate Board.

MANAGEMENT REFORM

The Commission urges the federal government to make needed reforms to improve management of the immigration system. While the Commission-recommended structural changes will help improve implementation of U.S. policy, certain management reforms also must be adopted if the restructured agencies responsible for immigration matters are to be effective in performing their functions. Structural reforms will not by themselves solve some of the management problems that have persisted in the immigration agencies.

More specifically, the Commission recommends:

- **Setting More Manageable and Fully-Funded Priorities**. The

Commission urges Congress and the Executive Branch to establish and then appropriately fund a more manageable set of immigration-related priorities. More manageable means fewer objectives, but also a set of more integrated priorities, more realistically-achievable short-term and long-term goals, and greater numerical specificity on expected annual outcomes to which agencies could be held accountable.

- **Developing More Fully the Capacity for Policy Development, Planning, Monitoring, and Evaluation.** Each department with immigration-related responsibilities needs to perform a wide range of policy functions, including, but not limited to, long-range and strategic policy planning, interagency policy integration, policy review, policy coordination, priority setting, data collection and analysis, budget formulation, decisionmaking, and accountability. The Domestic Policy Council and the National Security Council in the White House can also play an important role in coordinating policy development across departments.

- **Improving Systems of Accountability.** Staff who are responsible for immigration programs should be held accountable for the results of their activities. Systems should be developed to reward or sanction managers and staff on the basis of their performance.

- **Recruiting and Training Managers.** The Commission believes enhancements must be made in the recruitment and training of managers. As immigration-related agencies grow and mandated responsibilities increase or evolve, closer attention should be paid to improving the skills and managerial capacity of immigration staff at all levels to ensure more efficient and effective use of allocated resources.

- **Strengthening Customer Service Orientation.** The Commission urges increased attention to instilling a customer-service ethic in staff, particularly those responsible for adjudication of applications for benefits.

- **Using Fees for Immigration Services More Effectively.** The Commission supports the imposition of user fees, but emphasizes: (1) that the fees should reflect true costs; (2) that the agencies collecting the fees should retain them and use them to cover the costs of those services for which the fees are levied; (3) that those paying fees should expect to be treated to timely and courteous service; and (4) that maximum flexibility should be given to agencies to expand or contract their response expeditiously as applications increase or decrease.

The Commission reiterates its 1994 recommendations concerning the need for improvements in immigration data collection, coordination, analysis, and dissemination. Although some progress has been made, much more needs to be done to collect data that will inform responsible immigration policymaking. The Commission believes that each agency involved in immigration must establish a system and develop a strategy for the collection, interagency coordination, analysis, dissemination, and use of reliable data.

Further, the Commission urges the federal government to support continuing research and analysis on the implementation and impact of immigration policy. In particular, the federal government should support data collection and analysis in the following areas: longitudinal surveys on the experiences and impact of immigrants; on the experiences and impact of foreign students and foreign workers admitted for limited duration stays; and on the patterns and impacts of unlawful migration.

CONCLUSION

This report concludes the work of the U.S. Commission on Immigration Reform. Together with our three interim reports, this final set of recommendations provides a framework for immigration and immigrant policy to serve our national interests today and in the years to come. The report outlines reforms that will enhance the benefits of legal immigration while mitigating potential harms, curb unlawful migration to this country, and structure and manage our immigration system to achieve all these goals. Most importantly, this report renews our call for a strong commitment to Americanization, the process by which immigrants become part of our community and we learn and adapt to their presence. Becoming an American is the theme of this report. Living up to American values and ideals is the challenge for us all.

U.S. COMMISSION ON IMMIGRATION REFORM

1 9 9 5
EXECUTIVE SUMMARY

Legal Immigration: Setting Priorities

THE NATIONAL INTEREST

A properly regulated system of legal immigration is in the national interest of the United States. Such a system enhances the benefits of immigration while protecting against potential harms.

Immigrants often create new businesses and other employment-generating activities that promote the renewal of city neighborhoods and commercial districts. Immigrants also can strengthen America's economic and political ties with other nations and, thus, enhance our ability to compete in a global economy and provide leadership in international and humanitarian affairs. Properly regulated immigration further strengthens American scientific, literary, artistic and other cultural resources. It promotes family values and ties, important components of good schools and strong communities. At a time of troubling ethnic strife in many parts of the world, an effective American immigration policy can demonstrate to other countries that religious and ethnic diversity are compatible with national civic unity in a democratic and free society.

Legal immigration, however, has costs, as well as benefits. Immigrants with relatively low education and skills may compete for jobs and public services with the most vulnerable of Americans, particularly those who are unemployed or underemployed. Jobs generated by immigrant businesses do not always address this problem. Concentrated and/or rapid entry of immigrants into a locality may impose immediate net costs, particularly in education funding to meet the additional and special needs of newcomers. Concentration of new immigrants can exacerbate tensions among ethnic groups. Certain legal immigrant populations may impose other costs: refugees often need special health and other services, making per capita resettlement more costly than overseas solutions; elderly new immigrants are more likely to draw upon public services than elderly native-born Americans or immigrants who came to the United States at a younger age.

Immigrant Admissions by Major Category: FYs 1990-1994

Category of Admission	1990	1991	1992	1993	1994
SUBJECT TO THE NUMERICAL CAP	535,993	537,010	655,541	719,701	662,029
FAMILY-BASED IMMIGRANTS	448,640	455,415	502,995	539,209	497,682
Immediate Relatives of U.S. citizens	231,680	237,103	235,484	255,059	249,764
--Spouses and children	171,491	173,527	170,720	192,631	193,394
--Parents	60,189	63,576	64,764	62,428	56,370
Children born abroad to alien residents	2,410	2,224	2,116	2,030	1,883

Family-sponsored immigrants	214,550	216,088	213,123	226,776	211,961
--Unmarried sons/daughters of U.S. citizens	15,861	15,385	12,486	12,819	13,181
--Spouses and children of LPRs	X	X	90,486	98,604	88,673
--Sons and daughters of LPRs	X	X	27,761	29,704	26,327
--Married sons/daughters of U.S. citizens	26,751	27,115	22,195	23,385	22,191
--Siblings of U.S. citizens	64,252	63,462	60,195	62,264	61,589
Legalization dependents	X	X	52,272	55,344	34,074

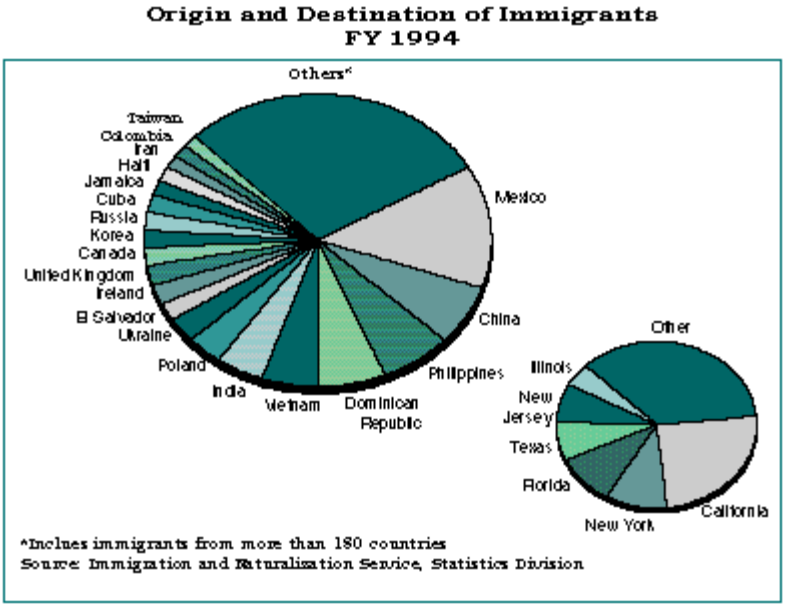
Source: Immigration and Naturalization Service, Statistics Division

The recommendations in this report strongly affirm the value of a properly regulated immigration system. They seek to maximize the many positive opportunities that legal immigration presents to our nation. At the same time, the recommendations will help mitigate potential negative impacts, particularly on disadvantaged U.S. workers. Finally, the Commission's recommendations support effective Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy, and equal opportunity. These recommendations should help ensure that our legal immigration system will continue to serve the national interest of the United States.



FRAMEWORK FOR IMMIGRATION REFORM

The Commission supports the basic framework of current policy-family unification, employment-based immigration, and refugee admissions. We considered alternative frameworks, particularly a point system, but rejected these approaches. We believe that a system that relies on formulas and bureaucratic procedures for determining which immigrants meet the ability criteria for admission is not as effective in serving the national interest as one that relies on the judgment of American families and employers within a framework that protects U.S. workers from unfair competition. At the same time, the Commission is convinced that our current immigration system must undergo major reform to ensure that admissions continue to serve our national interests. Hence, the Commission recommends a significant redefinition of priorities and a reallocation of existing admission numbers to fulfill more effectively the objectives of our immigration policy.*

PRINCIPLES FOR A PROPERLY REGULATED IMMIGRATION POLICY

The Commission believes that our immigration system should rest upon certain basic principles.

Clear Goals and Priorities. Sound immigration policy must set out clear goals and give priority to the admission of those immigrants who best meet those goals.

Enforcement of Immigration Limits. An effectively regulated immigration policy establishes limits on the number of immigrants that are consistent with the goals of the various categories under which immigrants enter. Moreover, these limits must be enforceable and enforced. We underscore our commitment to curtailing illegal immigration as embodied in our 1994 recommendations. We will continue to monitor progress toward their implementation until the expiration of our mandate in September 1997.

Regular Periodic Review. An effectively regulated system requires some flexibility with regard to numbers so as to permit adjustment as circumstances in the United States change.

Clarity and Efficiency. Immigration policy should not be overly complex, and the mechanisms used to implement immigration policy should be efficient and comprehensible. The terms used should be as clear and self-explanatory as possible. The number of visas allocated to various immigrant categories should be sufficient to ensure the expeditious entry of those of highest priority. Backlogs in high priority categories undermine the purposes of immigration policy, while backlogs in lower priority categories give false hope to individuals whose admissions are of lesser national interest.

Enforcement of Sponsor Responsibility. A properly regulated immigration policy will hold sponsors accountable for keeping immigrants from becoming burdens on the American taxpayer and enforce that accountability through legally binding obligations.

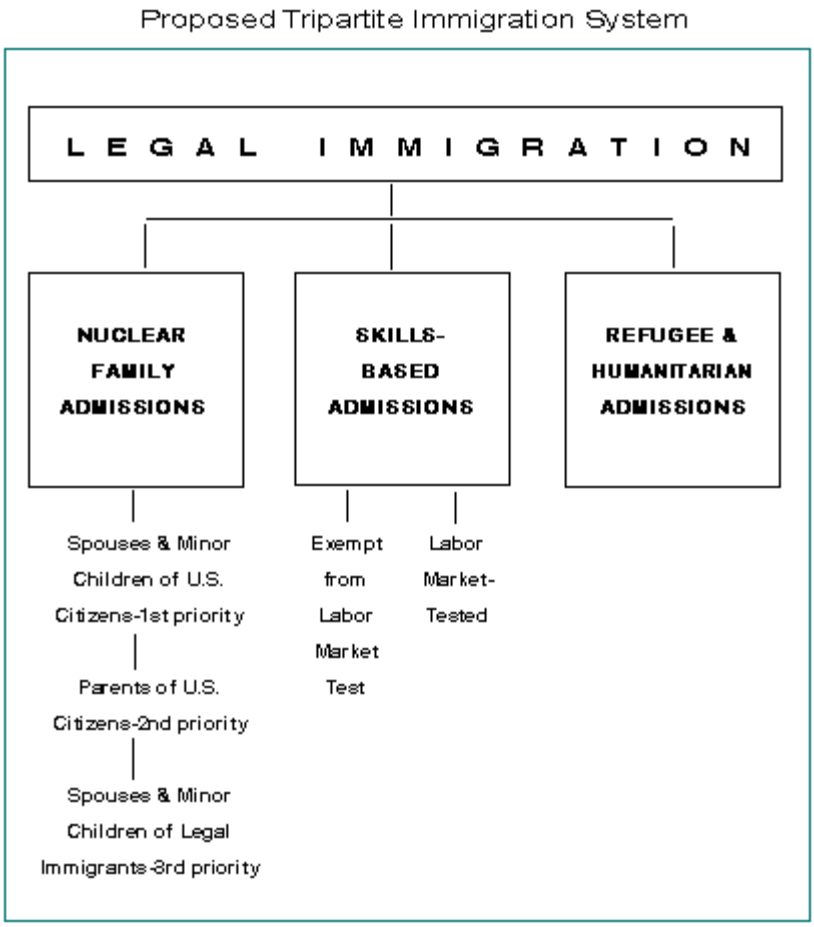
Protection of U.S. Workers. A properly regulated system will also provide protection to American workers against unfair competition arising from immigrant categories that are designed to enhance U.S. economic strength. A higher level of job protection should be made available to the most vulnerable in our society.

Coherence. Both temporary and permanent admissions categories must be seen as integral parts of a coherent legal immigration policy. Temporary student, worker, and humanitarian categories are linked to permanent immigration. Inefficiencies and inconsistencies in the procedures for determining admissibility in permanent categories frequently lead employees, employers, and even family members to use temporary categories to gain entrance when the immigrant's true intention is permanent residence.

Americanization. Immigration policy is not credible without attention to English language training, civic education, and preparation for naturalization and effective citizen participation. Americanization-by which we mean cultivation of a shared commitment to the American values of liberty, democracy, and equal opportunity-is desirable and possible regardless of the nationality, native language, or religious background of immigrants and their children.

A Transition Period. Fundamental immigration reform, as proposed by the Commission, requires a period of transition to get from the present system to the new one. We recommend prudent, measured steps to make that transition possible.

RECOMMENDATIONS



The following recommendations will contribute to a more accountable and credible application of our immigration policy:

The Commission supports a tripartite immigration policy that permits the entry of nuclear family members, professional and skilled workers, and refugees and other humanitarian admissions. In addition, the Commission urges Congress to take steps to address the continued aftereffects of the 1986 Immigration Reform and Control Act [IRCA] that provided legal status to formerly illegal aliens.

The Commission proposes a core immigration admissions level of 550,000 per year, to be divided as follows:

- Nuclear family immigration 400,000;
- Skill-based immigration 100,000;
- Refugee resettlement 50,000.*

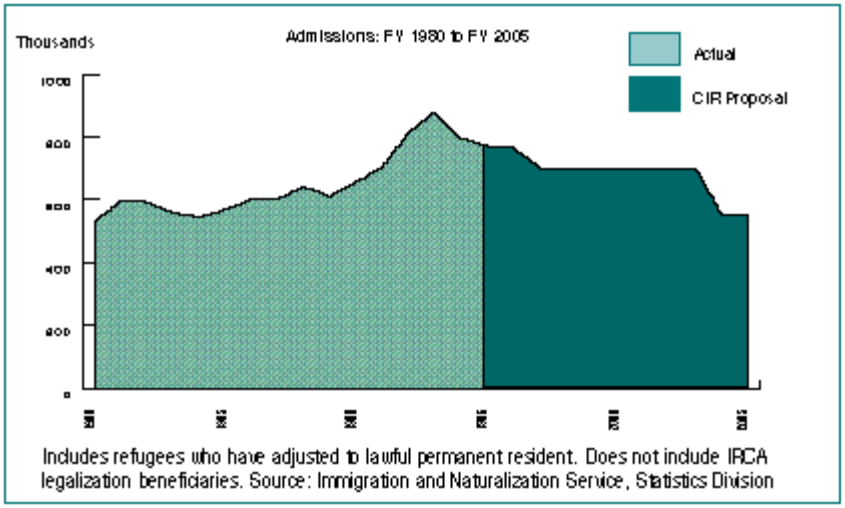
The Commission further recommends that Congress authorize 150,000 visas annually for the admission of the spouses and minor children of legal permanent residents who have been awaiting entry until such time as this backlog is eliminated.
The Commission recommends that admission levels be authorized by Congress for a specified time period (e.g., three to five years) in order to ensure regular periodic review and, if needed, change by Congress.
These recommendations represent fundamental reform of U.S. immigration policy.

Legal Immigration Levels

	Current		Proposed	
Category	Numerical Limits	FY 1996 Projected Use	Transition (5-8 years)	Core
Nuclear Family Admissions	480,000	480,000	550,000	400,000
Skills-based Admissions	140,000	100,000	100,000	100,000
Refugee Resettlement*	Variable	90,000	50,000**	50,000**
Diversity	55,000	55,000	0	0
TOTAL		725,000	700,000	550,000

*Does not include asylum claimants or other humanitarian admissions.
**50,00 is a target that can be exceeded in an emergency or with direct and affirmative participation by Congress.

Legal Immigration Admissions



Nuclear Family Immigration

Immigration supports the national interest by promoting strong and intact nuclear families-that is, the basic social unit consisting of parents and their dependent children living in one household. Immigration contributes to this national interest by permitting the entry of close family members of U.S. citizens and permanent residents who otherwise may be separated for years. Immigration policy also can contribute to the strength of U.S. families by ensuring that immigrants receive any needed financial support from their own relatives and, thus, impose no financial burdens upon the taxpaying public.

The Commission recommends:

A prioritization of family relationships to determine who will be admitted through family-based immigration, with admission numbers going to those who are of the highest priority. Only to the extent that visas are available after the demand in higher priorities is met should visas be made available to lower priority categories. Following this reasoning, the Commission makes further recommendations.

- Spouses and minor children of U.S. citizens should continue to be admitted as the first priority. Also to be admitted under this priority are the small number of adult children dependent on U.S. citizen parents because of a mental or physical disability. This policy permits the expeditious entry of the closest family members while reinforcing the notion that citizenship confers additional benefits on those who become fully participating members of our polity.

- Parents of U.S. citizens should be admitted as the second priority. This permits adult children to sponsor their parents, most of whom are past working age. However, the Commission is mindful of the potential negative impacts that the entry of parents may pose for the U.S. taxpayer if these individuals utilize Supplemental Security Income, Medicaid, and similar programs. Therefore, the Commission believes that continued admission of parents should be contingent on a legally enforceable affidavit of support. The affidavit should ensure that parents who are unable to work enough quarters to become eligible for Social Security or Medicare do not become a burden to taxpayers through use of SSI, Medicaid, or equivalent state and local services. Further, the Commission recommends that affidavit signers (petitioners and, if necessary, coguarantors) should provide:

    Verifiable assurance that they indeed have the capacity to provide what may be a lifetime of financial support to the parent immigrants; and
    Verifiable assurance of the purchase of what may be lifetime health coverage for the parent immigrants (obtained either privately or through buying into Medicare, which the government should make available at an actuarially fair price).

- Third priority should be allocated to spouses, minor children, and adult physically or mentally dependent children of legal permanent residents [LPRs].

The Commission further recommends sufficient additional numbers, on an interim basis, to eliminate the backlog in the category for admission of spouses and minor children of LPRs. We believe that this backlog, which results primarily from the Immigration Reform and Control Act, can be cleared without creating another waiting list. By the end of this fiscal year, 824,000 spouses and minor children of aliens legalized under IRCA will be waiting for visas. The number of new applications has fallen to only a handful for this group. However, since the filing of applications by the legalization beneficiaries, a backlog of 279,000 (or about 80,000 per year) spouses and minor children of other LPRs has developed. Under our current system, it would take more than a decade to clear the backlog, even with substantial naturalization. In the meantime, when an LPR sponsors a spouse and/or minor child, that individual goes to the end of the waiting list of 1.1 million.

We believe that priority for clearance of the backlog should go first to the spouses and minor children of LPRs who entered lawfully under the regular immigration preferences. Only afterwards should expedited admission be offered to the spouses and minor children of LPRs who entered under one of the legalization provisions of the Immigration Reform and Control Act.

The Commission recommends this separate treatment of the family members of those who became permanent residents through regular immigration and those who legalized under IRCA because:

- The circumstances are different for the two sets of spouses and minor children. Many of the families of the immigrants who legalized under IRCA are in the United States and, under the Family Unity provisions of the Immigration Act of 1990, have a quasi-legal status that permits their continued presence and work authorization. Many of the families of the other legal immigrants are separated, with their spouses and/or minor child(ren) living outside the United States.
- The legalized have already received special treatment in obtaining amnesty. To further reward their earlier illegal entry by giving equal or higher priority to the entry of their relatives sends the wrong message at a time in which the U.S. must obtain greater control over unauthorized entry.
- As of December 31, 1995, most legalized aliens will be eligible to naturalize. As citizens, they will be able to expedite the admission of their spouses and minor children without using the additional visas earmarked for LPRs.

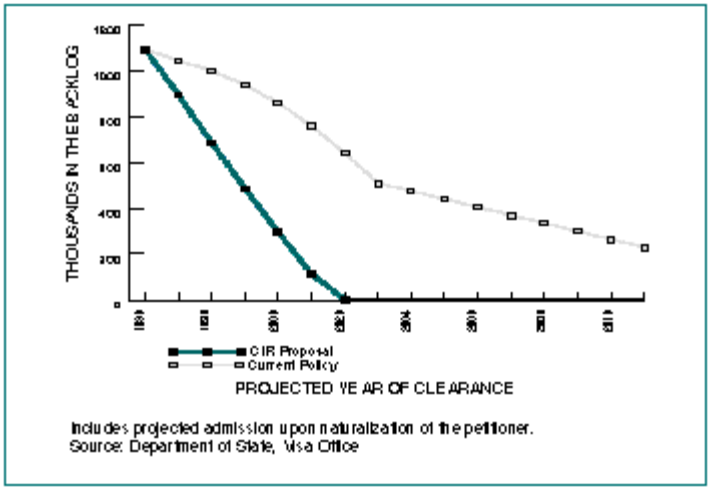
Family-Based Immigration:
Categories and Admission Numbers

CURRENT LAW	
CATEGORIES	USAGE (FY 1994)
Unlimited Spouses/Minor Children of USCs	193,394
Unlimited Parents of USCs	56,370
First Preference Adult Unmarried Sons/ Daughters of USCs	13,181
Second Preference	115,000
2A Spouses/Children of LPRs (88,673)	
2B Adult Unmarried Sons/ Daughters of LPRs (26,327)	
Third Preference Adult Married Sons/ Daughters of USCs	22,191
Fourth Preference Brothers/Sisters of USCs	61,589
TOTAL	461,725

CIR RECOMMENDATIONS		
CATEGORIES	ADMISSIONS (Transition)	ADMISSIONS (Core)
First priority Spouses/Minor Children of USCs	up to 400,000 (current usage about 200,000)	400,000
Second priority Parents of USCs	400,000 less number admitted under first priority (current usage about 55,000)	400,000 less number admitted under first priority
Third priority Spouses/Minor Children of LPRs	400,000 less number admitted under first and second priorities plus 150,000 for backlog clearance	400,000 less number admitted under first and second priorities
TOTAL	550,000	400,000

The Commission believes that the addition of 150,000 visas will permit the elimination of the regular LPR beneficiary backlog within three years and the legalization beneficiary backlog in five to eight years. Thereafter, the entry of all spouses and minor children of LPRs should be possible within a year of application under the proposed 400,000 admissions ceiling on family-based immigration.

Elimination of the Backlog: Spouses and Minor Children of Legal Immigrants



Includes projected admission upon naturalization of the petitioner.
Source: Department of State, Visa Office

The Commission recommends elimination of other family-based admission categories, including:

- Adult, unmarried sons and daughters of U.S. citizens;
- Adult, married sons and daughters of U.S. citizens;
- Adult, unmarried sons and daughters of legal permanent residents; and
- Siblings of U.S. citizens.

The Commission acknowledges that many individuals in these categories have contributed to U.S. society. Nevertheless, it is necessary at this time to emphasize the reunification of nuclear families. The elimination of these categories should take place one year after the date that legislation is enacted to accomplish this purpose. In this way, the plans of U.S. families that are on the verge of reunifying with their foreign siblings and adult children will not be unfairly disrupted.

The Commission recommends elimination of these categories for several reasons.

- The numbers now used to admit these individuals in more extended family relationships could be used instead to reduce the waiting time for closer family members without raising the overall levels of immigration.
- Elimination of these preferences will remove extraordinary backlogs that now undermine the credibility of our policy. Credible immigration policy should not give false hopes to applicants. An individual now applying under the sibling category, for example, could not expect to enter the U.S. legally for more than a decade. Applicants from the Philippines face the longest waiting period-as much as forty years for those applying today.
- Unless there is a compelling national interest to do otherwise, immigrants should be chosen on the basis of the skills they contribute to the U.S. economy. The Commission believes that admission of nuclear family members and refugees provide such a compelling national interest. Reunification of adult children and siblings of adult citizens solely because of their family relationship is not as compelling.

The Commission recommends amendment of Section 201(c) of the Immigration and Nationality Act [INA] to provide that otherwise unused immigrant visa numbers for a fiscal year be made available to people who have a priority date that would entitle them to processing in that year but who were not issued visas.

Given the large backlog of spouses and minor children, all efforts should be made to ensure their expeditious entry by fully utilizing authorized visas. Under current policy visas unused because of administrative delay or personal reasons are lost. Allowing such unused visas to be made available to otherwise eligible immigrants after the end of that fiscal year ensures that all the visas allocated for family-sponsored immigrants would be used and charged to the given fiscal year. The new fiscal year visa numbers would not reflect an increase in visas allocated over the annual worldwide limit for family-based immigration.

For example, if 400,000 visas were allocated for family-sponsored immigrants in FY 1997, and during that year only 390,000 visas were issued because 10,000 immigrants were delayed beyond the end of the fiscal year, the remaining 10,000 visas could be issued to the delayed or other eligible aliens during the next fiscal year but would count toward the original year. Under the proposed amendment, the Department of State could charge to FY 1997 all visas allocated in that year even though the visas themselves might not be issued in FY 1997. As the recommendation affects only aliens already entitled to a visa, annual number limitations would not be exceeded.

The Commission further recommends that the INA be amended to address better the aging-out problem of certain aliens. One unfortunate side effect of waiting lists is the aging-out of minor children who become adults while awaiting their already approved petition. This issue, which arises particularly in the case of the minor children of legal permanent residents, will become even more of a problem with the elimination of admission opportunities for adult children. For example, the minor child of a legalized alien may have been granted Family Unity status with the understanding that eventually a visa would be available. Under current law, a child who has aged-out would rarely be deported but is no longer eligible for permanent residence as a minor child. A provision stating that "a person entitled to status at the time a petition is approved shall continue to be entitled to that status regardless of his or her age" would allow such applicants to retain their eligibility for immigrant visas.

Skill-Based Immigration

Immigration can support the national interest by bringing to the U.S. individuals whose skills would benefit our society. It also can help U.S. businesses compete in the global economy. This national interest in the competitiveness of business must be balanced by an equally compelling national interest in developing a U.S. workforce that has the skills necessary to compete in the global economy. Immigration policy can contribute to this national interest by:

- Focusing on the admission of highly-skilled individuals;
- Giving employers access to a global labor market when they cannot identify U.S. workers with knowledge and expertise required for a specific job or when they demonstrate a labor shortage that cannot be filled through short-term training programs;
- Helping companies conducting business, both in the United States and internationally, to reassign personnel as needed to maintain their competitiveness;
- Encouraging entrepreneurial activities and other investment in the United States aimed at creation of jobs;
- Providing a means of ensuring that U.S. workers are not displaced or otherwise adversely affected by the entry of foreign workers; and
- Providing incentives or penalties to help ensure that employers in the U.S. engage in serious recruitment of American workers (for example, national rather than local recruitment where appropriate) and contribute significantly to the training of the comestic U.S. workforce.

The Commission recommends that the preferences for the admission of skill-based immigrants be reorganized to establish two categories: those subject to a lobor market test, which we would expect to be the norm; and those who, for significant and specific policy reasons, should be exempt from such a labor market test. Labor market testing requires a demonstration that a business has a *bona fide* need for the skills of a foreign worker and cannot find a qualified U.S. worker or one who could be readily trained for the intended job.

Skills-Based Immigration:
Categories and Admission Numbers

CURRENT LAW	
Categories	Usage (FY 1994)
FIRST PREFERENCE Aliens with Extraordinary Ability Outstanding Professors/Researchers Multinational Executives and Managers	21,053
SECOND PREFERENCE Professionals with Advanced Degrees	14,432
THIRD PREFERENCE Skilled Workers (2 years training/experience) Professionals with Baccalaureate Degrees	46,269
FOURTH PREFERENCE Ministers and Religious Workers	7,946
FIFTH PREFERENCE Investors (Entrepreneurs)	444
TOTAL	90,184

CIR RECOMMENDATIONS	
Categories	Admissions (proposed)
LABOR MARKET TEST EXEMPT Aliens with Extraordinary Ability Multinational Executives and Managers Entrepreneurs Ministers and Religious Workers (Limited to current usage, about 8,000)	Up to 100,000 (current usage about 30,000)
LABOR MARKET TESTED Professionals with Advanced Degrees (Including professors and researchers who do not meet the definition of "extraordinary") Professionals with Baccalaureate Degrees Skilled Workers (5 years specialized experience)	100,000 less number admitted in exempt category (current usage about 60,000)
TOTAL	

Exempt workers should include those individuals whose entry will generate economic growth and/or significantly enhance U.S. intellectual and cultural strength without undermining the employment prospects and remuneration of U.S. workers. The following individuals should be exempt:

Individuals at the very top of their chosen field whose extraordinary ability in the sciences, arts, education, business, or athletics is demonstrated by sustained national or international acclaim and whose achievements have been recognized through extensive documentation, or individuals who have demonstrated the potential for extraordinary achievement in their chosen field through extensive documentation, including the receipt of internationally-recognized prizes and the testimony of appropriate experts;

Managers and executives of international businesses whose expertise contributes to U.S. global competitiveness. Greater safeguards must be put in place to ensure that only bona fide international businesses benefit from this policy;

Entrepreneurs whose active investment in new commercial enterprises generate a significant number of jobs for American workers in the United States;

A limited number of individuals ordained by a religious denomination and other religious workers who have carried on the religious vocation abroad during the two years immediately preceding the application for admission and who are members of a religious denomination having a bona fide nonprofit, religious organization in the United States that sponsors them.

Labor market-tested foreign workers permitted to immigrate to the United States under these

categories should include only those who have attained a baccalaureate or higher academic degree or those who are needed to fill jobs that require a high level of specific skills above the entry or journeyman level. Categories that would require a test of the domestic labor market include:

> **Professionals with advanced degrees**, including professors and researchers who do not meet the definition of "extraordinary;"
>
> **Professionals with baccalaureate degrees, and skilled workers with a minimum of five years of specialized work experience**, whose admission should be scrutinized strictly to ensure that they will have no adverse effect on similarly qualified U.S. workers.

The Commission recommends the elimination of the admission of unskilled workers. Unless there is another compelling interest, such as in the entry of nuclear families and refugees, it is not in the national interest to admit unskilled workers. This is especially true when the U.S. economy is showing difficulty in absorbing disadvantaged workers and when efforts towards welfare reform indicate that many unskilled Americans will be entering the labor force.

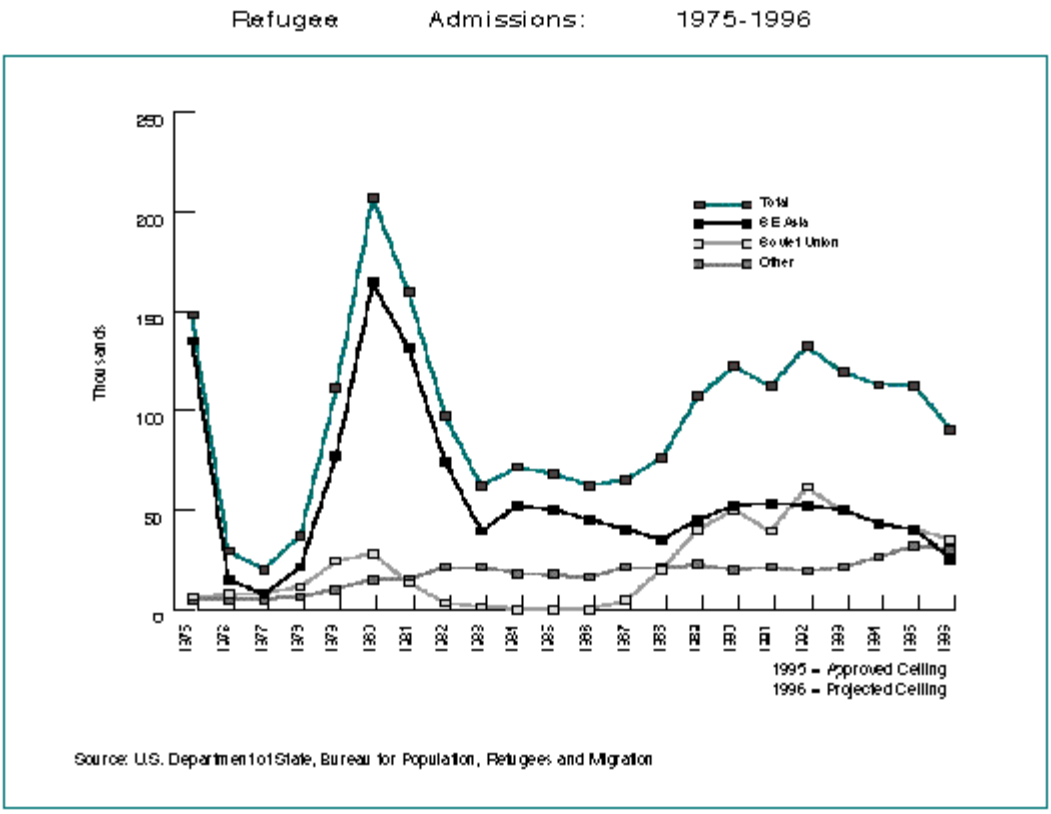
The Commission is not satisfied with current labor certification procedures because they are neither timely enough to meet the needs of employers with a bona fide interest in hiring a foreign worker nor effective in protecting the interests of U.S. workers. We seek to replace a failed and expensive regulatory system with one that is market-driven. (The cost to the federal government was about $70 million in 1992 and is estimated to be about $60 million in 1995.) The Commission recommends replacing the labor certification procedure with a more timely and effective labor market test.

To demonstrate the bona fide need for a foreign worker and to increase the competitiveness of U.S. workers, **an employer should be required to pay a substantial fee, that is, make a substantial financial investment into a certified private sector initiative dedicated to increasing the competitiveness of U.S. workers**, for example through education and training. Employers seeking to hire foreign workers already incur substantial financial costs and face lengthy processing delays. Under the Commission's proposal, the fee would go towards developing a well-trained U.S. workforce rather than supporting costly bureaucratic processes. To ensure that the employer, and not the foreign worker, pays the fee, penalties should be imposed upon violators.

Employers should demonstrate that they have engaged in appropriate attempts to find a qualified U.S. worker using normal company recruitment procedures that meet industry-wide standards and offering wages that are at least 5 percent above the prevailing wage.

The resulting permanent resident status so obtained should be conditional for a two-year period. Conditional status would be removed at the end of that period if the foreign worker is still employed by the same employer at the same or higher level and if the employer demonstrates that the attested wage has been paid. The law should specify conditions under which the foreign worker could obtain a waiver of the two-year requirement. For example, it could be waived in situations where unanticipated circumstances, such as layoffs or business failure, occur or where an employer's unfair labor practices would render the foreign worker subject to abuse. To prevent both fraud and abuse against workers, penalties should be authorized.

To provide greater flexibility and allow for market adjustments, the Commission recommends that skill-based visas not used in a fiscal year be carried over to the next year's skill-based numbers.



Refugee Resettlement

The Commission strongly affirms that the United States should continue its commitment to resettle refugees as one of several elements of humanitarian protection for the persecuted. Refugee admissions fulfill a humanitarian commitment to provide protection and assistance to those who otherwise would be persecuted or endangered. The Commission recommends that, on an interim basis:

> The U.S. should allocate 50,000 admission numbers each year to the entry of refugees from overseas (not including asylum adjustments);
>
> Other than in emergency situations, refugee admissions could exceed the 50,000 admissions level only with more direct and affirmative participation by Congress than occurs in the current consultation process;
>
> In the case of an emergency, the President may authorize the admission of additional refugees upon certification of the emergency circumstances necessitating such action. The Congress may override the emergency admissions only with a two-house veto of the Presidential action.

Allocating a set number of refugee admissions, with provisions to exceed this number in case of an emergency or other changed circumstances, ensures a continued U.S. commitment to resettlement, particularly following the expected closure of the current refugee programs in Southeast Asia and, possibly, the former Soviet Union. These two programs account for almost 80 percent of current resettlement (about 87,000 out of 112,000 admissions in FY 1994).

Reform of the current consultation process is needed to ensure Congressional oversight of decisions made to exceed the 50,000 limit. Current consultations are often pro forma and occur very late in the planning process. As discussed below, the Commission will provide recommendations on mechanisms for decisionmaking on numbers in a forthcoming report.

The U.S. should take leadership in generating international responses to refugee crises, with particular focus on international burdensharing and regional solutions. Future policies also must take into account the relative weight to be given resettlement versus the other avenues open to the United States to help protect and assist refugees worldwide, including support for repatriation of refugees to their homelands when conditions permit.

The Commission recommends a thorough assessment of the criteria used to admit refugees for resettlement and the procedures for their admission. The contexts for making future policy regarding refugee resettlement are in flux. The refugee resettlement program must be revamped to meet the needs of a post-Cold War world. Today extreme nationalism and ethnic conflicts produce massive population displacements while resolution of other conflicts is permitting large-scale voluntary repatriation. Resettlement criteria should take into account the protection of refugees who otherwise would be endangered in a country of origin or asylum and who would have no other alternatives.

The Commission is reviewing a variety of issues related to refugee resettlement, including: the priority system; in-country refugee processing; country-specific legislation; procedural issues; congressional and Executive Branch roles, including the consultation process; the role of international organizations; parole authority; and domestic assistance, including the role of the state and local organizations (e.g., nongovernmental organizations and voluntary agencies).

Specific recommendations on refugee resettlement-which may include modification of the above interim recommendations-will be included in a future Commission report. This report also will include recommendations related to immigration emergencies.

Nonimmigrant Admissions

The Commission believes that both permanent and temporary (nonimmigrant) admissions must be considered as part of an integrated immigration system. Although we are deferring specific recommendations on most nonimmigrant issues until we have completed a comprehensive review, we do note two areas of particular interest.

Temporary Workers and Foreign Students. The Commission intends to examine in depth the nonimmigrant temporary worker and foreign student systems and their relationships to permanent immigration. In particular, we will be looking at ways to simplify and achieve greater coordination in these systems and to make recommendations as a result of this study. A high percentage of applicants for permanent skill-based admission are already in this country on temporary work or student visas. Businesses that intend to petition for permanent visas for new hires frequently obtain temporary visas first because of long delays in processing. In addition, a significant number of individuals admitted for temporary study or work seek permanent jobs during their stay. As noted above, these categories of temporary admission must be seen as integral parts of a coherent legal immigration policy. The Commission will address these specific issues in a later report.

Agriculture Guestworker Program. The Commission believes that an agriculture guestworker program, sometimes referred to as a revisiting of the "bracero agreement," is not in the national interest and unanimously and strongly agrees that such a program would be a grievous mistake.

First, the Commission is highly skeptical of the need for an agricultural guestworker program at this time or in the near future. Proponents of such a program have failed to demonstrate that a labor shortage is about to occur or that there are no means other than a guestworker program available to agricultural producers to obtain sufficient employees in their industry.

Guestworker programs effectively expand rural poverty. Moreover, guestworker programs are predicated on limitations on the freedom of those who are invited to enter and work. Experience has shown that such limitations are incompatible with the values of democratic societies. For that very reason, "temporary" guestworkers tend to become permanent residents, de facto or even de jure. The inconsistency between the stated intent of guestworker programs and their actual consequences cannot be ignored by policymakers who seek credibility in a reformed system.

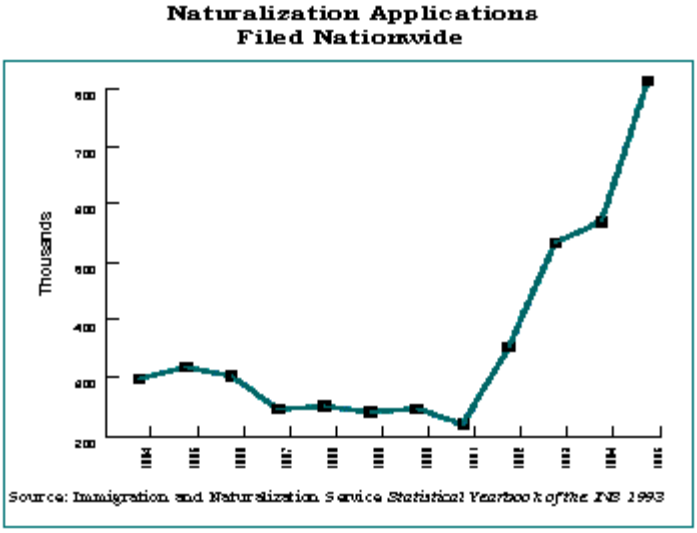
Americanization

The Commission supports effective Americanization of new immigrants, that is the cultivation of a shared commitment to the American values of liberty, democracy, and equal opportunity. The United States is one of the most successful multiethnic nations in history. It has united immigrants and their descendants from all over the world around a commitment to democratic ideals and constitutional principles. Those ideals and principles have been embraced by persons from an extraordinary variety of religious and ethnic backgrounds, partly because they permit and protect religious and cultural diversity within a framework of national political unity.

Religious and cultural diversity does not pose a threat to the national interest as long as public policies ensure civic unity. Such policies should help newcomers learn to speak, read, and write English effectively. They should strengthen civic understanding in the teaching of American history for all Americans. They should lead to the vigorous enforcement of laws against hate crimes and of laws to deter and to punish discrimination. Of course, such policies should encourage the naturalization of immigrants as the path to full civic participation.

At the same time, immigration to the United States should be understood as a privilege, not a right. Immigration carries with it obligations to embrace the common core of the American civic culture, to become able to communicate--to the extent possible--in English with other citizens and residents, and to adapt to fundamental constitutional principles and democratic institutions.

In its further deliberations, the Commission will consider other public policies that are believed by some to encourage ethnocentrism in the name of multiculturalism or to promote political separatism in the name of civil rights. For example: Do bilingual education and affirmative action as applied to immigrants and their children promote or diminish civic unity? Now that immigrants come from more than 160 nations and many more ethnic groups, it is extremely important that public policies facilitate, not inhibit, the Americanization of newcomers.



Naturalization is the most visible manifestation of civic incorporation. At present, there is greater interest in naturalization than there is a capacity to act upon this interest. Large backlogs must be overcome so that the nation can benefit from the growing commitment of immigrants to become American citizens.

The Commission strongly recommends that INS adopt and implement as a strategic goal the reduction of processing time and backlogs for naturalization while maintaining rigorous standards in processing applications. The Commission also urges Congress to appropriate sufficient resources to support the implementation of this strategic goal. Applicants for naturalization pay a fee designed to cover the costs of the application process. The fees go into an account dedicated to use for examinations. The Commission believes that naturalization applicants have the right to receive the timely service that their fee represents. Naturalization fees should not subsidize other activities. Nor should an efficient naturalization procedure require a reallocation of resources from other priority functions. If the current fee is not adequate to cover the full costs of timely naturalization, it should be increased appropriately. Further, the Commission urges INS to:

Set a standard reasonable time frame for processing naturalization applications. The time frame should permit timely review of applications without lowering the standards for civics and English language knowledge or compromising the required background checks. The INS also should improve processes and policies, as well as allocation of resources, to establish a level of efficiency that can withstand fluctuations in volume.

Continue to recruit national and community-based organizations, both public and private, as well as employers, to assist in facilitating smooth operation of the processing of naturalization applications. These organizations have proved very helpful in prior partnerships with INS in: overseeing proper completion of applications; taking security check fingerprints; serving as testing sites for the required English and civics examinations; briefing applicants on procedures; providing less intimidating final interview sites; and reviewing files before interviews to make certain that examiners need spend time only on substantive interview issues.

Ensure that there are adequate numbers of personnel to complete naturalization processing efficiently. To reduce waiting periods in districts with backlogs, INS should reassign personnel and, where appropriate, designate examiners who will do naturalization interviews exclusively. In instances where an interview can be waived, INS should permit naturalization applications to be filed, reviewed, and approved at one of its four Regional Service Centers.

Carefully scrutinize the naturalization applications of all Special Agricultural Workers [SAW] to assure that their original SAW status was properly granted. Reports of widespread fraud in this program require such special attention to applications for U.S. citizenship by SAW legalization beneficiaries.

The Commission urges both the public and private sectors to assist legal immigrants in their preparation for naturalization.

The Commission urges private industry, churches, community groups and individual volunteers to redouble their efforts to provide English language instruction and civics education to immigrants. The current increased interest in naturalization presents an opportunity to use instruction in English, U.S. history, and civics to help immigrants participate more fully in the life of the community. Private sector initiatives would fill current gaps in such services. These programs also would benefit the providers, particularly businesses, who would gain from a workforce better able to communicate in English.

The Commission supports targeted outreach programs aimed at informing eligible

immigrants about the requirements for naturalization. Outreach programs are critical to civic ncorporation. They encourage immigrants to want to become citizens and help ensure awareness of opportunity and equitable access to information about naturalization.

CONCLUSION

These interim conclusions and recommendations on legal immigration to the United States are a first step in the Commission's examination of the implementation and impact of our legal immigration system. Together with our earlier recommendations on illegal immigration, they seek to restore credibility to our immigration policies.

This report defines the national interest in immigration. It outlines mechanisms that permit the expeditious entry of those who are of highest priority for admission while mitigating potential harmful effects on U.S. communities and vulnerable populations.

The Commission continues our longer-term investigation of the impact of legal immigration on the United States. Based on the results of these studies, the Commission expects to make further recommendations on legal immigration in our final report to Congress in 1997.

U.S. COMMISSION ON IMMIGRATION REFORM

summary

U.S. Immigration Policy: Restoring Credibility

EXECUTIVE SUMMARY

Introduction

The U.S. Commission on Immigration Reform was created by Congress to assess U.S. immigration policy and make recommendations regarding its implementation and effects. Mandated in the Immigration Act of 1990 to submit an interim report in 1994 and a final report in 1997, the Commission has undertaken public hearings, fact-finding missions, and expert consultations to identify the major immigration-related issues facing the United States today.

This process has been a complex one. Distinguishing fact from fiction has been difficult, in some cases because of what has become a highly emotional debate on immigration. We have heard contradictory testimony, shaky statistics, and a great deal of honest confusion regarding the impacts of immigration. Nevertheless, we have tried throughout to engage in what we believe is a systematic, non-partisan effort to reach conclusions drawn from analysis of the best data available.

Underlying Principles

Certain basic principles underlie the Commission's work. The Commission decries hostility and discrimination against immigrants as antithetical to the traditions and interests of the country. At the same time, we disagree with those who would label efforts to control immigration as being inherently anti-immigrant. Rather, it is both a right and a responsibility of a democratic society to manage immigration so that it serves the national interest.

Challenges Ahead

The Commission believes that legal immigration has strengthened and can continue to strengthen this country. While we will be reporting at a later date on the impacts of our legal immigration system, and while there may even be disagreements among us as to the total number of immigrants that can be absorbed into the United States or the categories that should be given priority for admission, the Commission members agree that immigration presents many

opportunities for this nation. Immigrants can contribute to the building of the country. In most cases, they have been actively sought by family members or businesses in the U.S. The tradition of welcoming newcomers has become an important element of how we define ourselves as a nation.

The Commission is mindful of the problems that also emanate from immigration. In particular, we believe that unlawful immigration is unacceptable. Enforcement efforts have not been effective in deterring unlawful immigration. This failure to develop effective strategies to control unlawful immigration has blurred the public perception of the distinction between legal and illegal immigrants.

For the Commission, the principal issue at present is how to manage immigration so that it will continue to be in the

national interest.

* How do we ensure that immigration is based on and supports broad national economic, social, and humanitarian interests, rather than the interests of those who would abuse our laws?

* How do we gain effective control over our borders while still encouraging international trade, investment, and tourism?

* How do we maintain a civic culture based on shared values while accommodating the large and diverse population admitted through immigration policy?

The credibility of immigration policy can be measured by a simple yardstick: people who should get in, do get in; people who should not get in are kept out; and people who are judged deportable are required to leave.

During the decade from 1980 to 1990, three major pieces of legislation were adopted to govern immigration policy--the Refugee Act of 1980, the Immigration Reform and Control Act of 1986, and the Immigration Act of 1990. The Commission supports the broad framework for immigration policy that these laws represent: a legal immigration system that strives to serve the national interest in helping families to reunify and employers to obtain skills not available in the U.S. labor force; a refugee system that reflects both our humanitarian beliefs and international refugee law; and an enforcement system that seeks to deter unlawful immigration through employer sanctions and tighter border control.

The Commission has concluded, however, that more needs to be done to guarantee that the stated goals of our immigration policy are met. The immediate need is more effective prevention and deterrence of unlawful immigration. This report to Congress outlines the Commission's recommendations in this area.

In the long term, immigration policies for the 1990s and beyond should anticipate the challenges of the next century. These challenges will be substantially influenced by factors such as the restructuring of our own economy, the establishment of such new trade relationships as the North American Free Trade Agreement [NAFTA], and changing geopolitical relations. No less importantly, immigration policy must carefully take into account social concerns,

demographic trends, and the impact of added population on the country's environment.

Finally, current immigration is the first to occur in what economists call a post-industrial economy, just as it is the first to occur after the appearance of the modern welfare state. The Commission's report to Congress in 1997 will cover these issues in assessing the impact of the Immigration Act of 1990. The present report reviews the progress of the beginning implementation of this legislation.

RECOMMENDATIONS

Serious problems undermine present immigration policies, their implementation, and their credibility: people who should get in find a cumbersome process that often impedes their entry; people who should not get in find it all too easy to enter; and people who are here without permission remain with impunity.

The Commission is convinced that unlawful immigration can be controlled consistent with our traditions, civil rights, and civil liberties. As a nation with a long history of immigration and commitment to the rule of law, this country must set limits on who can enter and then must credibly enforce our immigration law. Unfortunately, no quick and easy solutions are available. The United States can do a more effective job, but only with additional financial resources and the political will to take action. Our recommendations for a comprehensive, effective strategy follow.

Border Management

The Commission believes that significant progress has been made during the past several years in identifying and remedying some of the weaknesses in U.S. border management. Nevertheless, we believe that far more can and should

be done to meet the twin goals of border management: preventing illegal entries while facilitating legal ones.

Land Borders

Credibility is a problem at U.S. land borders, given the ease of illegal entry and various obstacles to legal entry. These problems are particularly prevalent at the U.S.-Mexico border, as the Commission's visit to San Diego and El Paso demonstrated. The Commission believes that an underlying principle of border management is that prevention is far more effective and cost-efficient than the apprehension and removal of illegal aliens after entry. At the same time, the Commission believes that legal entry should be facilitated in order for the country to benefit from cross-border trade and tourism.

The Commission supports the strategy, now being tested as "Operation Hold the Line" in El Paso, that emphasizes prevention of illegal entry at the border, rather than apprehension following illegal entry. Prevention holds many advantages: it is more cost-effective than apprehension and removal; it eliminates the cycle of voluntary return and reentry that has characterized unlawful border crossings; and it reduces potentially violent confrontations on the border. The Commission recommends:

* **Increased resources for prevention**, including additional staff, such improved technology as sensors and infrared scopes, data systems that permit expeditious identification of repeat offenders, and such additional equipment as vehicles and radios.

* **Increased training for border control officers** to execute strategies that emphasize prevention of illegal entry.

* **Formation of a mobile, rapid response team to improve Border Patrol anticipation of new smuggling sites and to augment their capacity at these locations.** The Immigration and Naturalization Service [INS] must develop a capacity to respond quickly to changing patterns of unlawful immigration along the land border. Also, contingency plans should be developed to address increased boat arrivals that may arise from improved land border enforcement.

* **Use of fences to reduce border violence and facilitate enforcement. However, the Commission does not support the erection of extraordinary physical barriers, such as unscaleable walls, unless needed as a last resort to stop violence when other means have proved ineffective.** Fences have been used effectively in San Diego to reduce border violence, deter illegal aliens from running across the interstate highway that leads from Mexico, and facilitate enforcement.

* **Systematic evaluation of the effectiveness of any new border strategies by INS.** The typical measurements of Border Patrol effectiveness--apprehension rates--have little meaning in assessing a prevention strategy. INS should develop new evaluation techniques that measure the effects of border management efforts in terms of the flow of unauthorized aliens and their impacts on U.S. communities.

The Commission supports efforts to reduce potentially violent confrontations between Border Patrol officers and those believed to be seeking illegal entry into the U.S. Such confrontations were reduced, for example, during "Operation Hold the Line," in terms of both reported human rights violations against suspected illegal aliens and attacks on Border Patrol officers.

The Commission supports efforts already underway to address complaints about human rights violations, including:

*** Increased training and professionalism of Border Patrol officers to enable them to respond appropriately to potentially violent situations;**

*** Improved procedures for adjudicating complaints of Border Patrol abuses;**

*** Mechanisms to provide redress or relief to those subjected to improper actions;** and

* More effective protection of Border Patrol officers from violence directed at them.

The Commission believes that port of entry operations can be improved. Legal entry at the border should be facilitated as the United States benefits from trade, tourism, family visits and consumer spending. More specifically, the Commission supports:

* **Additional resources for inspections** at land border ports of entry.

* **An expedited adjudication and issuance process for the Border Crossing Card [BCC]**. Mexican nationals are required to have a visa (unlike Canadians). Because of the volume of BCC applications on the Mexican border, the Commission encourages negotiations between the U.S. and Mexico to amend the bilateral treaty to permit collection of fees to be used exclusively to expedite the issuance and adjudication of the card.

* **Further steps to better ensure that the BCC is not misused by legal crossers who engage in unauthorized employment after entry.** Each BCC should contain the legend indicating it is "not for work authorization," as currently appears on INS-issued cards.

* **Development of a land border user fee to pay for needed improvements in the inspection of border crossers,** with fees to be used exclusively to facilitate land border management.

The Commission supports increased coordination on border issues between the governments of the U.S. and Mexico. The Commission views favorably the discussions underway between the U.S. and Mexican governments. These discussions promote greater cooperation between the two governments in solving problems of mutual concern. In particular, the Commission encourages:

* **Continued cooperation in antismuggling efforts** to reduce smuggling of people and goods across the U.S.-Mexico border.

* **Bilateral discussions that take into account both U.S. entry and Mexican exit laws in devising a cooperative approach to regulating the movements of people across the U.S.-Mexican land border.** Mexican law requires that Mexican nationals exit Mexico through official inspection stations. Thus, unauthorized migration into the United States generally violates not only U.S. law, but Mexican law as well.

* **Cross border discussions and cooperative law enforcement efforts** among federal, state, and local officials of both countries to develop cooperative approaches to combat violent crimes and auto and cargo theft along the border.

* **Continued U.S. cooperation and support for Mexican efforts to address the problem of third-country nationals crossing Mexico** to come to the United States.

Airports

Each year about 50 million citizens and aliens enter the country through airports.

The Commission supports a combined facilitation and enforcement strategy that would prevent the entry of unauthorized aliens while facilitating legal admissions at U.S. airports as efficiently as possible, including:

*** The use of new technologies to expedite the inspections process and improve law enforcement, including more efficient processing of travelers with Machine Readable Documents.**

* **Programs that enhance the capacity of airline carriers to identify and refuse travel to aliens seeking to enter the U.S. on fraudulent documents,** including the Carrier Consultant Program and other coordinated efforts to maintain complete, accurate, and reliable Advance Passenger Information System [APIS] data and improved lookout data systems.

* **Continued government-airline industry discussions on improving inspections** that have led to innovative proposals.

* **Development of a system for mitigation of penalties or fines for those carriers that cooperate in screening and other pro-**

grams and demonstrate success in reducing the number of unauthorized aliens they carry.

* **Making INS, not the carrier, responsible for the actual physical custody of inadmissible air passengers.**

Interagency Coordination

The Commission expresses its dissatisfaction with the past lack of coordination between the Customs Service and the INS at ports of entry. This has hampered effective border management by both agencies.

The Commission recommends implementation of initiatives to

improve coordination between INS and Customs, as recommended by the General Accounting Office [GAO] and the National Performance Review. The Commission will monitor these efforts to improve coordination of border management, particularly as they relate to immigration matters.

If these efforts prove ineffective, the Commission will recommend more extensive action, such as creating a new immigration and customs agency or designating one agency as the lead agency on inspections.

Alien Smuggling

Organized smuggling operations undermine the credibility of U.S. enforcement efforts and pose dangers to the smuggled aliens.

The Commission recommends an effective prevention strategy that requires enhanced capacities to combat organized smuggling for commercial gain. Possible enhancements include:

* **Expanded enforcement authorities,** such as Racketeer Influenced and Corrupt Organizations Act [RICO] provisions, wiretap authority, and expanded asset forfeiture for smuggling aliens; and

* **Enhanced intelligence gathering and diplomatic efforts** to deter smuggling.

Worksite Enforcement

The Commission believes that reducing the employment magnet

is the linchpin of a comprehensive strategy to reduce illegal immigration. The ineffectiveness of employer sanctions, prevalence of fraudulent documents, and continued high numbers of unauthorized workers, combined with confusion for employers and reported discrimination against employees, have challenged the credibility of current worksite enforcement efforts.

Verification

A better system for verifying work authorization is central to the effective enforcement of employer sanctions.

The Commission recommends development and implementation of a simpler, more fraud-resistant system for verifying work authorization. The current system is doubly flawed: it is too susceptible to fraud, particularly through the counterfeiting of documents; and it can lead to increased discrimination against foreign-looking or foreign-sounding authorized workers.

In examining the options for improving verification, ***the Commission believes that the most promising option for***

secure, non-discriminatory verification is a computerized registry using data provided by the Social Security Administration [SSA] and the INS.

The key to this process is the social security number. For decades, all workers have been required to provide employers with their social security number. The computer registry would add only one step to this existing requirement: an employer check that the social security number is valid and has been issued to someone authorized to work in the United States.

The Commission believes the computerized system is the most promising option because it holds great potential for accomplishing the following:

* **Reduction in the potential for fraud.** Using a computerized registry, rather than only an identification card, guards against counterfeiting of documents. It provides more reliable information about work authorization.

* **Reduction in the potential for discrimination** based on national origin and citizenship status, as well as inappropriate demands for specific or additional documents, given that employers will not be required to ascertain whether a worker is a citizen or an immigrant and will have no reason to reject documents they believe to be counterfeit. The only relevant question will be: "What is your social security number?"

* **Reduction in the time, resources, and paperwork** spent by employers in complying with the Immigration Reform and Control Act of 1986 [IRCA] and corresponding redirection of enforcement activities from paperwork violations to knowing hire of unauthorized workers.

***The Commission recommends that the President immediately initiate and evaluate pilot programs using the proposed computerized verification system in the five states with the highest levels of illegal immigration as well as several less affected states*.** The President has the authority to do so under Section 274A(d)(4) of the Immigration and Nationality Act. A pilot program will: permit the testing of various approaches to using the proposed verification system; provide needed information about the advantages, disadvantages, and costs of the various approaches; develop and evaluate measures to protect civil rights and civil liberties; and ensure that any potential obstacles, such as the quality of the data used in the registry, are addressed prior to national implementation. Assuming the successful results of the pilot program, Congress should pass the necessary statutory authorities to support more effective verification. Pilot program features should include:

* **A means by which employers will access the verification system to validate the accuracy of information given by workers**. We have received conflicting testimony about the best way to check the applicant's identity. We have heard proposals for a more secure social security card, a counterfeit-resistant driver's license, and a telephone verification system that does not rely on any document. The pilot program presents an opportunity to determine the most cost-effective, fraud-resistant, and nondiscriminatory method available.

* **Measures to ensure the accuracy of and access to the specific data needed** to ensure that employers have timely and reliable information when seeking verification of work authorization. Improvements in the Social Security Administration and INS databases must be made to ensure that these data are available. Procedures must be developed to ensure timely and accurate entry, update, extraction, and correction of data. The Commission strongly urges INS and the Social Security Administration to cooperate in this endeavor, as the proposed registry would be built upon and--once implemented--would support the primary missions of those agencies.

* **Measures to ensure against discrimination and disparate treatment of foreign-looking or -sounding persons.** The Commission believes that the least discriminatory system would have the same requirements for citizens and aliens alike. To reduce the potential for discrimination and increase the security of the system, the Commission also believes that employers should not be required to ascertain immigration status in the process of verifying authorization for employment. Their only requirement should be to check the social security number presented by each employee against the registry and record an authorization number to prove that they have done so.

* **Measures to protect civil liberties.** It is essential that explicit protections be devised against use of the database--and any card or any other means used to gain access to it--for purposes other than those specified in law. The uses to be

made of the verification system must be clearly specified. We believe the worksite verification system could be used, without damage to civil liberties, for verifying eligibility to receive public benefits [see p. 22]. However, it should be stipulated that no one should be required to carry a card, if one is used, or to present it for routine identification purposes. There also should be penalties for inappropriate use of the verification process.

* **Measures to protect the privacy of the information included in the database.** The Commission is aware of the proliferation of databases and the potential for the invasion of privacy by both government and private agencies. There need to be explicit provisions for protecting privacy; the resultant system should incorporate appropriate safeguards regarding authorized users' access to individual information. In establishing privacy safeguards, it is important to take into account that, while access to any one piece of information may not be intrusive, in combination with other information such access may violate privacy.

* **Estimates of the start-up time and financial and other costs** of developing, implementing and maintaining a national system in such a manner that verification is reliable.

* **Specification of the rights, responsibilities, and impact on individual workers and employers,** for example: what individuals must do; how long it will take for newly authorized workers to get on the system and to correct inaccurate data; and what will be required of employers and at what expense. Provisions must also be developed to protect both workers from denial of employment and employers from penalties in cases where the information provided by the computer registry may be missing or inaccurate.

* **A plan for phasing in of the system.** The Commission recognizes that the proposed verification system will result in financial costs. The system should be phased in to lessen the immediate impact. The pilot programs should test various phase-in procedures. Given the required levels of accuracy, reliability, and convenience required, the evaluation should help measure the cost of phasing in the system nationally.

The Commission recommends evaluation of the pilot programs to assess the effectiveness of the verification system. The evaluation should include objective measures and procedures to determine whether current problems related to fraud, discrimination, and excessive paperwork requirements for employers are effectively overcome without imposing undue costs on the government, employers, or employees. The evaluation should pay particular attention to the effectiveness of the measures used to protect civil liberties and privacy.

The Commission supports INS efforts to improve its Telephone Verification System/SAVE [TVS/SAVE] database--but only as an interim measure. The improvements are essential for improving the data needed for the new, more effective verification process. The Commission is aware of the inadequacies of the current INS data that would be used in the proposed system. The Commission does not endorse the TVS/SAVE program as a long-term solution to the verification problem because use of TVS/SAVE requires the inadequate mechanism of self-attestation by workers as to their citizenship or alienage, thus making it easy for aliens to fraudulently claim U.S. citizenship. It also imposes requirements on legal immigrants that do not apply to citizens. Nevertheless, improvements in this database, as well as the Social Security Administration database, are essential to the development of a more secure, less potentially discriminatory verification system.

The Commission also recommends action that would reduce the fraudulent access to so-called "breeder documents," particularly birth certificates, that can be used to establish an identity in this country, including:

* **Regulation of requests for birth certificates** through standardized application forms;

* **A system of interstate and intrastate matching** of birth and death records;

* **Making certified copies of birth certificates issued by states or state-controlled vital records offices the only forms accepted by federal agencies**;

* **Using a standard design and paperstock for all certified copies** of birth certificates to reduce counterfeiting; and

* **Encouraging states to computerize** birth records repositories.

To address the abuse of fraudulent documents, the Commission recommends imposition of greater penalties on those producing or selling such documents. Document fraud and counterfeiting has become a lucrative and well-organized operation that may involve international networks that conspire to produce and sell the resulting fraudulent products. These documents are used in smuggling and terrorist operations, as well as for work authorization. RICO provisions designed to facilitate racketeering investigations should cover conspiracy to produce and sell fraudulent documents. Criminal penalties should also be increased for large-scale counterfeiting activities

Antidiscrimination Strategies

The Commission is concerned about unfair immigration-related employment practices against both citizens and noncitizens that may occur under the current system of employer sanctions. A more reliable, simpler verification system holds great potential to reduce any such discrimination because employers will no longer have to make any determination as to immigration status. Nevertheless, mechanisms must effectively prevent and redress discrimination.

The Commission recommends that the Office of the Special Counsel [OSC] for Immigration-Related Unfair Employment Practices in the Department of Justice initiate more proactive strategies to identify and combat immigration-related discrimination at the workplace. OSC should target resources on independent investigations and on programs to assess the incidence and prevalence of unfair immigration-related employment practices.

The Commission also recommends a methodologically-sound study to document the nature and extent of unfair immigration-related employment practices that have occurred since GAO's 1990 report. The new study should measure the effects of immigration policy--as distinct from other factors--on discrimination at the worksite. As noted above, the pilot programs should be evaluated to determine if they substantially reduce immigration-related discrimination at the workplace.

Employer Sanctions and Labor Standards Enforcement

The Commission believes that enforcement of employer sanctions, wage/hour, child labor, and other labor standards can be an effective tool in reducing employment of unauthorized workers. The Commission finds, however, that current enforcement efforts are inadequate. In addition, the Commission expresses its concern that current coordination efforts between the Immigration and Naturalization Service and the Department of Labor are insufficient.

The Commission supports vigorous enforcement of labor standards and enforcement against knowing hire of unauthorized workers as an integral part of the strategy to reduce illegal immigration. Labor standards and employer sanctions should be seen as mutually reinforcing. Specifically, the Commission recommends:

* **Allocation of increased staff and resources to the enforcement of labor standards to complement employer sanctions enforcement.**

* **Vigorous enforcement, increased staff and resources, and full use of current penalties against those who knowingly hire unauthorized workers.** If the new verification system proposed by the Commission substantially reduces inadvertent hiring of unauthorized workers--as we believe will occur--Congress should discontinue paperwork pen-alties and evaluate the need for in-creased penalties against violators and businesses that knowingly hire or fail to verify work authorization for all employees.

* **Targeting of investigations to industries that have a history of using illegal alien labor.**

* **Enhanced enforcement efforts targeted at farm labor and other contractors** who hire unauthorized workers on behalf of agricultural growers and other businesses.

* **Application of employer sanctions to the federal government**. At a minimum, the President should issue an Executive Order requiring federal agencies to abide by the procedures required of other employers. Alternatively, legislation should stipulate that federal agencies follow the verification procedures required of other employers and be

subject to penalties if they fail to verify work authorization.

The Commission urges the Attorney General and the Secretary of Labor to review the current division of responsibilities between the Departments of Justice and Labor in the enforcement of employer sanctions and labor standards. INS and the Department of Labor have signed a Memorandum of Understanding [MOU] that spells out each agency's responsibility for enforcing employer sanctions and labor standards. Preliminary evidence indicates that few warnings have been issued to employers under the MOU. The implementation of the MOU should be closely monitored over the next twelve months. Should the monitoring demonstrate that the joint efforts have not resulted in effective enforcement, it may be necessary to designate a single agency to enforce employer sanctions.

The Commission recommends enhanced coordination mechanisms to promote cooperation among all of the agencies responsible for worksite enforcement. Strategies to promote coordination at headquarters and in field operations include:

* **Establishment of a taskforce in Washington, D.C., to review and set policy**;

* **Local taskforces of worksite investigators** to coordinate field operations; and

* **Continued joint training for worksite investigators** from all applicable agencies.

Education

Thousands of new businesses begin operations each year. New workers enter the labor force each year as well.

The Commission recommends coordination and continuance of educational efforts by the Immigration and Naturalization Service, the Office of Special Counsel, and the Department of Labor regarding employer sanctions, antidiscrimination provisions, and labor standards. The Commission calls upon these agencies to develop and communicate a single message to all employers and employees. The Commission also recommends the development of new strategies, including the enhanced use of technology, to inform employers and workers of their rights and responsibilities under the law.

Benefits Eligibility and Fiscal Impact

The Commission believes a clear and consistent policy on immigrant eligibility for public benefits is needed. The Commission also believes that the federal government has a responsibility to mitigate the impacts of unlawful immigration on states and localities, particularly through renewed efforts to reduce illegal entries.

Eligibility

The U.S. has the sovereign authority to make distinctions as to certain rights and responsibilities of various people subject to its jurisdiction--illegal aliens, legal immigrants, and U.S. citizens. Policies regarding the eligibility of aliens for public benefits should be consistent with the objectives of our immigration policy.

The Commission recommends that illegal aliens should not be eligible for any publicly-funded services or assistance except those made available on an emergency basis or for similar compelling reasons to protect public health and safety (e.g., immunizations and school lunch and other child nutrition programs) or to conform to constitutional requirements. Illegal aliens are now eligible for few benefit programs. The Commission firmly believes that benefits policies should continue to send this message: if aliens enter the U.S. unlawfully, they will not receive aid except in limited instances. Federal legislation should permit states and localities to limit eligibility of illegal aliens on this same basis. Should illegal aliens require other forms of assistance, their only recourse should be return to their countries of origin.

* **The pilot programs on work authorization also should test new procedures for verification of benefit eligibility.**

Verification of eligibility for federally-funded benefits is an essential part of the overall strategy for maintaining a credible benefits enforcement policy. Many of the shortcomings of the eligibility verification process are parallel to those for employment. The proposed pilot programs will provide an opportunity to test new approaches to benefit eligibility verification.

* **An equitable policy based on immigration status must be adhered to in cases of mixed households** (households in which some members are legal residents and/or citizens and others are illegal aliens). Regardless of a family's economic situation, only citizen members or those legally authorized to reside and work in the U.S. should receive routine benefits. Some benefits could be prorated in order to provide them only to eligible recipients in a household.

The Commission recommends against any broad, categorical denial of public benefits to legal immigrants. The United States admits legal immigrants with the expectation that they will reside permanently in the United States as productive residents. Therefore, the Commission believes that:

* **The safety net provided by needs-tested programs should continue to be available to those whom we have affirmatively accepted as legal immigrants into our communities.** U.S. immigration law bars the entry of those who are likely to become a public charge [see below]. However, circumstances may arise after entry that create a pressing need for public help--unexpected illness, injuries from a serious accident, loss of employment, a death in the family. Under such circumstances, legal immigrants should be eligible for public benefits if they meet other eligibility requirements.

* **Sponsors should be held financially responsible for the immigrants that they bring to this country.** In particular, the Commission believes that the affidavits of support signed by sponsors should be legally enforceable, with contingencies made if the sponsor's financial circumstances change significantly for reasons that occurred after the immigrant's entry. Mechanisms should be developed that would ensure that sponsors actually provide the support they have promised. This would protect recent immigrants and close a loophole in current policy wherein the sponsor's income is "deemed," or taken into account, in calculating the immigrant's eligibility, regardless of whether such support is actually available to the immigrant.

* **A serious effort to enhance and enforce the public charge provisions** in immigration law is needed to ensure that legal immigrants do not require public assistance within five years of entry for reasons that existed prior to entry. The Commission recommends modification in the procedures for deporting such individuals. The sustained use of public benefits for reasons that existed prior to entry should become the basis for deportation. Current practices are unreasonable: the government is required to show that the benefit program requested repayment of the aid under a specific statute and that the immigrant has refused repayment.

The Commission recommends that comprehensive categories of aliens in the U.S. be defined in the Immigration and Nationality Act to simplify determination of eligibility for public benefits. The Commission believes that benefit eligibility determinations are complicated by the myriad legal statuses now afforded to individuals within this country. While the rights of lawful permanent residents, refugees and asylees have been spelled out in the Immigration and Nationality Act and/or benefit laws, it is also true that the Congress, Executive Branch, and the courts have created various other statuses that may or may not denote benefit eligibility.

The Commission recommends:

* **Establishment of statutory categories of aliens according to their eligibility for work and benefits.** Such categories could include those who are authorized to work and eligible for needs-tested benefits, subject to public charge and sponsorship provisions; authorized to work and eligible only for benefits that accrue from employment; not authorized to work and not eligible for any but a circumscribed list of benefits.

* **Placement of every alien who is permitted to remain in the country on a temporary or permanent basis (whether by legislation, court order, or administrative order) in one of the designated categories.** The categories should reflect whether an alien has been affirmatively admitted to the United States, is awaiting a final decision on deportability, or has already been determined deportable and is awaiting removal.

Impact on States and Localities

Difficulties in enforcing U.S. immigration laws have created fiscal impacts that would not have occurred had enforcement strategies been more effective. The ineffective enforcement has been due, in some measure, to a lack of political will on the part of decisionmakers, including officials and representatives of states now heavily affected by illegal immigration. Nevertheless, the federal government clearly bears a responsibility for alleviating these impacts, particularly through renewed efforts to reduce unlawful immigration.

The Commission supports in principle a short-term authorization of impact aid to offset at least a portion of the fiscal burdens of unlawful immigration until such time as better enforcement measures are in place. Any such aid should be provided contingent on the following conditions:

* **Better data and methods to measure the net fiscal impact of illegal immigration**. The Commission finds that weak data make it difficult to determine the extent of these burdens. The authorization of impact aid should follow a concerted effort to develop better data on such impacts, with impact assistance provided only to the extent that actual net costs are accurately identified.

* **Provision of any impact aid authorized in a manner commensurate with the interim period of regaining control over unauthorized immigration.** Impact aid mechanisms should be temporary and designed to ensure that governments do not become dependent on impact aid as a continuing source of funding.

* **Appropriate cooperation of state and local governments receiving impact aid with federal authorities** to enforce the immigration laws of the United States. The type of cooperation will vary depending on the assistance programs covered by impact aid and should be consistent with the federal laws and regulations that apply to the program in question. For example, law enforcement officers may be asked to provide information to identify convicted or arrested illegal aliens, whereas school officials would not be required to transfer information obtained from their pupils.

The Commission supports an immediate authorization of impact aid aimed specifically at criminal justice costs. The Commission believes impact assistance for criminal justice and law enforcement is justified where there is a high incidence of illegal aliens in the criminal justice system. Specific costs attributable to the incarceration of illegal aliens can be reliably ascertained if state correctional departments cooperate with INS in identifying deportable illegal aliens in prisons. The federal government should assume responsibility for the costs of incarcerating illegal aliens through reimbursement, by incarcerating them in federal facilities, and/or by negotiating with foreign governments to accept and incarcerate their nationals who are criminal illegal aliens.

The Commission recommends further investigation of the costs of education and emergency medical assistance. The data currently available do not provide reliable estimates of the number of illegal alien children and the proportion of emergency medical assistance specifically associated with illegal aliens. While the Commission accepts in principle the need for enhanced federal funding to assist localities with the costs of providing elementary and secondary education to illegal alien children and of emergency medical care under Medicaid to illegal aliens, the Commission does not recommend that such a program be instituted until there is a workable method for accurately establishing actual costs.

Detention and Removal of Criminal Aliens

An effective procedure for prompt removal of aliens ordered deported is an essential part of a credible deterrence policy. If unlawful aliens believe that they can remain indefinitely once they are within our national borders, there will be increased incentives to try to enter or remain illegally. The Commission is reviewing the full range of issues raised by U.S. exclusion and deportation procedures and plans to issue a separate report on this subject in FY 1995. For the present, the Commission limits its specific recommendations to the removal of criminal aliens who represent the most serious threat to public safety and national security.

The top priority of enforcement strategies should be the removal of criminal aliens from the U.S. in such a way that the potential for their return to the U.S. will be minimized. To help ensure the prompt and effective removal of criminal aliens, the Commission recommends:

* **Increased resources for INS investigations** to identify and initiate deportation of criminal aliens.

* **Enhanced use of the Institutional Hearing Program [IHP] as an effective mechanism to ensure that criminal aliens are identified and receive final orders of deportation while still serving their sentences.** The IHP is cost-effective in that criminal aliens can be deported directly from state and federal prisons, alleviating INS' need to detain them during deportation proceedings. The Commission commends the negotiations taking place between INS, the Executive Office of Immigration Review [EOIR], and state correctional departments to enhance their efficiency.

* **In the case of Mexico, repatriation of deported criminal aliens to the area of Mexico from which they came, rather than simply to the border.** Removals should be done in coordination with Mexican authorities who may then determine if there is a warrant for the arrest of the criminal alien for crimes committed in Mexico.

* **Use of bilateral treaties encouraging the transfer of criminal aliens to serve sentences in their own countries.** The Department of State should monitor these cases to be certain that sentences are served.

Immigration Emergencies

Since 1980, emergency circumstances in their home countries have prompted the migration of large numbers of people to the U.S. Their arrival, in turn, has created emergency circumstances within the United States. The exodus of Haitians and Cubans are only the most

recent examples. An emergency can overwhelm resources and create

massive problems that far outlast the emergency.

The Commission believes that a credible immigration policy requires the ability to respond effectively and humanely to immigration emergencies. Specific recommendations regarding emergencies will be the subject of a separate report in FY 1995 that will include discussion of contingency planning, interdiction, safe havens, refugee processing, asylum procedures, temporary protected status, aid to communities experiencing emergency arrivals of aliens, and other issues.

Curtailing Unlawful Immigration at the Source

Migrants enter and remain unlawfully in the United States for a variety of reasons. Few migrants take the decision to leave their countries lightly. Generally, a combination of "push" and "pull" factors contribute to these movements. Many of the recommendations in this report aim to reduce the pull of both jobs and of ineffective immigration enforcement. On the push side, lack of employment, low wages and poor working conditions, separation from family members, political, social and religious repression, civil conflict, and other problems motivate people to leave their homes. Any effective strategy to prevent unlawful migration must address these causes.

The Commission recommends that the United States give priority in its foreign policy and international economic policy to long-term reduction in the causes of unauthorized migration to the U.S. More specifically, the Commission supports:

* **The recommendations of the Commission for the Study of International Migration and Cooperative Economic Development related to trade with, and investment in, immigrant-sending countries.**

* **Adoption of quick and effective strategies targeted at alleviating migration pressures in communities producing large numbers of illegal aliens.**

* **Strengthening intelligence gathering capacities to improve early warning of unauthorized migration patterns.**

* **Coordinated efforts by the United States and other countries to address pressures for unlawful migration.** The Commission recommends a strengthening of those multilateral coordination efforts that prove effective in averting unauthorized migration, particularly within the Western Hemisphere.

Improving Data

Throughout the Commission's own inquiry, we have found it difficult to assess the effects of immigration policy and of immigration itself because of inadequacies in the data. The Commission commends the work of the InterAgency Working Group on Immigration Statistics that is seeking to reform data collection efforts within the federal government. Reliable data is a necessary ingredient for credible policy and its implementation.

***The Commission supports improved data collection efforts in four major areas*:**

* **Matching administrative data** on immigrants collected by the INS, Social Security Administration, and other agencies to obtain a more accurate profile of their experiences in this country;

* **Developing a methodology for better measuring the size of the illegal alien population and the flow of illegal aliens entering the United States;**

* **Developing new methods for estimating emigration** from the United States; and

* **Improving the estimates of the costs and benefits** associated with people of different immigration status.

THE IMMIGRATION ACT OF 1990 AND LEGAL IMMIGRATION

The Immigration Act of 1990 [IMMACT], which provided for the most comprehensive change in the legal immigration system since 1965, aimed to:

* Establish overall limits on legal immigration through adoption of a flexible cap on total numbers;

* Permit continued reunification of close family members (allowing increases above the cap if higher numbers of immediate relatives of U.S. citizens seek entry);

* Meet labor market needs by

increasing the number of immigrants admitted for employment-based reasons and giving higher priority to the entry of professionals and others who are highly skilled; and

* Provide greater diversity through new opportunities for migration from countries with relatively small numbers of immigrants to the United States.

IMMACT Effects on Migration

The principal provisions of IMMACT were not implemented until 1992, and with only two years worth of data, there is little experience to use in determining its effects. The Diversity Program will not go into effect until FY 1995. The following analysis, therefore, must be considered preliminary at best.

As Table 1 shows, overall levels of legal immigration increased from an average of 640,000 during the five years preceding IMMACT implementation to an average 840,000 for the past three years. The immigrants fall into two major categories: those whose numbers are subject to an annual statutory cap and those whose numerical limits can change each year.

Statutory Cap

IMMACT established a flexible worldwide level of 700,000 family-based, employment-based, and diversity

immigration visas for FYs 1992-1994. This limit can be "pierced" if the number of immediate relatives of U.S. citizens, for whom there are no numerical limits, exceeds 239,000 (FYs 1992-1994) and 254,000 (FY 1995 and after).

* **Family-sponsored immigration** increased modestly since passage of IMMACT, largely because of an increase in the number of immediate relatives of U.S. citizens. Waiting lists that number more than one million persons continue in the categories under which spouses and minor children of permanent residents and siblings of U.S. citizens enter the United States. Much of the growth in the backlog for spouses and children is attributable to the large number of legalized aliens who are now seeking to reunify with their families.

* **Employment-based immigration** represents a sizeable increase over the 58,000 average employment-based immigration pre-IMMACT. Nevertheless, employment-related admissions under the new legislation have been well below the statutory ceiling of 140,000. Many of those who entered, particularly in 1992, were in the backlog of individuals who had applied prior to IMMACT. In addition, Chinese nationals who adjusted status under the provisions of the Chinese Student Protection Act were counted in this category. The economic recession may have led employers to petition for fewer immigrant workers than allowable under the IMMACT ceilings.

* **Diversity immigration** has not yet begun in its permanent form. The diversity transition program averaged 34,000 in FY 1992-93. As of FY 1995, 55,000 visa numbers will be available for the permanent diversity program.

Immigrants outside the Statutory Cap

The number of immigrants considered in the categories outside the statutory cap varies each year, largely depending on the number of refugees admitted in prior years who adjust to permanent resident status. Refugees are initially admitted under conditional status and may adjust to permanent resident status after one year. Because of the increase in refugee admissions from the former Soviet Union that began in 1988, the 1990s have seen an increase in refugee adjustments.

Characteristics of Legal Immigrants

INS maintains data on the countries of origin, age, gender, occupation, and place of intended residence of new immigrants.

* **Places of origin.** IMMACT has not changed the regional origins of immigrants significantly. Asia accounts for more than 40 percent of new admissions, while North America, including Mexico, accounts for another 30 percent. Mexico appears to have almost doubled its number of new arrivals since IMMACT passed, largely because of the legalization dependents program and the elimination of per-country limits for some second preference family visas.

* **Age and gender**. The median age of immigrants admitted in FYs 1992 and 1993 was 28. About 54 percent of the immigrants were female and 46 percent were male. By contrast, during the 1980s, men and women were equally represented. The trend toward more women admitted as legal immigrants began prior to IMMACT. It is likely to be reinforced by the entry of the family members of aliens legalized under IRCA. Very high proportions of young adult legalized aliens were men, many of whom have already petitioned for their wives.

* **Intended residence.** Immigration follows much the same pattern as in the 1980s regarding intended residence. Approximately 70 percent of the immigrants intend to live in the six states of California, New York, Texas, Florida, New Jersey, and Illinois. More than 25 percent of immigrants intend to live either in New York City or Los Angeles. Other metropolitan areas with significant immigrant arrivals are Chicago, Miami, Washington, D.C., and San Francisco.

* **Occupation**. Among those who reported an occupation, the percentage of immigrants of working age who were professionals or executives increased slightly from 15 percent in the two years before IMMACT to 17 percent in fiscal years 1992 and 1993. Every other occupation group declined, except for operators, fabricators, and laborers, which increased from 9.2 to 9.7 percent.

Looking to the Future

Much has changed in the U.S. and the world since passage of IMMACT--for example, the end of the Cold War, cutbacks in many defense industries, and such new trade arrangements as NAFTA and the most recent round of GATT. Commission recommendations must take into account this changing context, along with the changes brought about by IMMACT.

Future Commission activities will include:

* Exercising the Commission's mandate to assess the impact which the establishment of a national level of immigration has upon the availability and priority of family preference visas.

* Developing an understanding of both the long- and short-term interconnections between immigration and the U.S. economy and labor market with an eye toward formulating sound immigration policy.

* Examining the effects of our immigrant population on social and community relations, as well as the effects of American life on immigrants. A further area of interest is the civic integration of immigrants, including participation in local, state, and national political affairs, development of political constituencies, and other manifestations of civic involvement.

* Looking at data and analyses regarding population pursuant to IMMACT's instruction to determine and report on the effects of immigration on demographics and natural resources.

* Analyzing and reporting on the relationship between immigration and the environment as mandated by IMMACT.

* Examining the interconnections between U.S. immigration and international trade and foreign policy.

Plans for FY 1995--FY 1997

The Commission will launch a new research program to gauge the effects of IMMACT upon the size and characteristics of the incoming immigrant population and to evaluate the impacts that legal immigration poses for family reunification, the U.S. economy, social relations, demographics, the environment, foreign policy, and national security.

The Commission will also develop further recommendations to address two of the issues touched on in this report--removal of deportable aliens and handling of immigration emergencies.

The Commission plans to continue its schedule of public hearings, roundtable consultations and fact-finding missions. The Commission's assessments will be discussed and recommendations offered in future reports.

INTRODUCTION

In recent years the international community, as well as individual governments, have placed growing emphasis on preventing the movement of people across international borders. This trend is in part a response to new, post-Cold War opportunities to address the political, economic, and environmental problems—often referred to as "root causes"—that potentially could result in large-scale movements of people. The United Nations' efforts to find a political settlement to the conflicts in the former Yugoslavia and Somalia and to provide in-country assistance and protection to victims of those crises are examples of this new emphasis on prevention. In a November 1992 speech before the U.N. General Assembly, Mrs. Sadako Ogata, the U.N. High Commissioner for Refugees, explained that her agency's preventive activities "have taken the form of enhancing legal norms through extending technical advice, training, information and institution building, particularly in countries confronted by actual or potential refugee problems." (Ogata 1992)

Coinciding with these efforts to resolve the root causes of population displacement is a trend toward increasingly restrictive asylum policies in a number of countries. Political and economic pressures in the United States and Germany, for example, have led to proposed legislative and procedural changes aimed at deterring immigration. This restrictionism is also fueled by a perception that these countries are becoming overwhelmed by influxes of asylum seekers. The U.N. General Assembly's 47th Session acknowledged the rise in "persistent problems in countries or regions seriously jeopardizing the security or well-being of refugees, including incidents of refoulement, expulsion, physical attack, and detention under unacceptable conditions," and it called upon member states "to take all measures necessary to ensure respect for the principles of refugee protection."

In some cases, efforts to avert mass migration are motivated by concern that the influx of migrants to an area could overwhelm local services. Even if the migrants are of humanitarian concern, a government may decide that a humanitarian crisis could ensue if receiving communities do not have the capacity to provide migrants with such basic necessities as food, housing, and medical services. In such situations, a favorable—yet often difficult to achieve—alternative is to distribute the burden of receiving the migrants among a number of countries.

When migration emergencies are the result of political repression, a subset of the

population involved may qualify as refugees and their rights to seek asylum and not to be returned forcibly to a country where they face persecution should be protected. At the same time, many of those involved in immigration emergencies are fleeing from difficult economic conditions but have no claim to asylum. Overly generous immigration policies could leave industrialized countries open to unmanageable influxes of people seeking immigration and economic opportunities. Therefore, one of the key issues at hand for the United States in seeking to respond effectively to migration emergencies is to strike an appropriate balance between protecting the rights of refugees and maintaining reasonable control over its borders.

In June of 1980, when faced with mass migration from Cuba and Haiti, Victor Palmieri, the U.S. Coordinator for Refugees at that time, noted the difficulty of making refugee determinations in the face of a large-scale immigration emergency:

> The Refugee Act of 1980 did not contemplate the kind of situation we face now, with a sudden massive influx, without overseas processing and valid documentation. The procedures for dealing with asylum seekers in this country require lengthy examinations on a case-by-case basis that would leave many arrivals in limbo status for long periods, without eligibility for federally funded assistance.

At the same time, he noted, "we cannot stand by in silent witness to the unsafe and uncontrolled exodus" from Cuba (Palmieri 1980).

Fourteen years later, the United States continues to struggle with the challenge of planning for and responding to immigration emergencies in ways that treat migrants humanely and respect the rights of refugees without exceeding the country's capacity to absorb new immigrants. Over the past two decades, the United States has had to respond to a number of immigration emergencies, most notably from Haiti, Cuba, Central America, Eastern Europe, and Indochina. This briefing paper provides background information on the spectrum of options the United States has available to avert immigration emergencies. These options range from responding to the early warnings of an emergency before displacement occurs to redirecting the flow once people leave.

EARLY WARNING AND PREVENTION

Early warnings of large-scale movements of people allow advance time to plan an appropriate response, whether it be alleviating the problems causing the displacement or mounting a humanitarian response for those who choose to flee. The response to early warnings should be determined in a comprehensive framework that takes into consideration conditions in the sending and receiving countries, as well as the situation of those at risk of becoming displaced. In some situations the need for people to flee across international borders can be prevented if the economic and political problems triggering their flight are identified at an early stage and reported to international or local institutions that can resolve them. Early warning depends upon the systematic collection and analysis of field observations in areas of potential displacement. Early warnings of impending population displacements can be detected in such precipitating factors as political instability, human rights violations, or the outbreak of conflict. The response to early warning information depends largely upon the amount of time between the detection of signals and the potential or actual displacement. If detected early enough, these warnings in some cases can lead to prevention. If identified too late to avoid the displacement, they can allow for contingency planning and a more adequate and timely response to the outflow.

When a crisis breaks out and the threat of large-scale displacement is imminent, efforts can be made to provide adequate assistance and protection within the country to avoid the need for people to cross an international border. The growing emphasis that the U.N. High Commissioner for Refugees has placed on internally displaced persons in recent years is aimed at preventing international displacement. On October 4, 1993, the High Commissioner stated: "UNHCR is prepared . . . to intervene on behalf of the internally displaced when our involvement could have a preventive impact on refugee problems. For example, we could provide protection or assistance to displaced people who might otherwise feel compelled to cross the border to become refugees."

One of the most difficult challenges of assisting and protecting people within their countries is gaining access to them. Governments sometimes obstruct relief efforts by outside parties by saying that these activities infringe upon their sovereignty. This is particularly true in situa-

tions where the governments do not want outsiders to interfere with their domestic policies. A major turning point in the international community's ability to gain humanitarian access to persons at risk within their own national borders was U.N. Security Council Resolution 688 (1991) which allowed the Allied Coalition to go into northern Iraq to provide assistance and protection to persons displaced by the civil war in that country.

In addition to the humanitarian intervention in northern Iraq, other innovative approaches have been taken in recent years to provide assistance and protection within countries in the midst of war so that people do not need to flee. In Sri Lanka, for example, the UNHCR has set up Open Relief Centers [ORCs] where people affected by the conflict can obtain essential relief assistance in a safe environment until conditions stabilize.

In Somalia, "preventive zones" were planned to protect displaced victims of civil conflict. Assistance in the form of food, seeds, agricultural equipment, and livestock are brought across the border from Kenya into designated zones in Somalia. The objectives of this program are to improve the living conditions of those remaining in the preventive zones, to deliver essential supplies to people at risk of becoming displaced, and to encourage the return of Somali refugees in Kenya.

The special provisions contained in the Immigration Act of 1990 [IMMACT] for residents of Hong Kong are an example of preventive measures taken far in advance of a potential immigration emergency. Anticipating a possible mass exodus when Hong Kong is incorporated into the People's Republic of China [PRC] in 1997, IMMACT includes provisions aimed at regulating the admission of residents of Hong Kong who may want to immigrate legally to the United States over the next twenty years.

INTERNATIONALIZING IMMIGRATION EMERGENCIES

When an immigration emergency cannot be prevented by resolving the problems causing displacement, strategies must be found that put the least strain on the countries trying to respond to the exodus. The United States' experience with large scale immigration emergencies during the past two decades testifies to the tremendous challenge of providing a humane response that does not exceed the country's capacity to receive immigrants. Ideally the burden of responding to an immigration

emergency should be distributed among a number of countries. Such an arrangement often requires skillful diplomacy and a commitment on the part of governments to the principle of burden-sharing.

International Response to the Indochinese Migration Crisis 1979-1989

The 1975 victories of communist forces in Vietnam, Cambodia, and Laos led to a migration crisis of such urgency and magnitude that in July 1979, the U.N. Secretary-General convened an international conference attended by sixty-five governments to formulate an international emergency response. Neighboring countries agreed to allow temporary refuge to Indochinese asylum seekers, the UNHCR committed resources for their care and maintenance, and third countries pledged to resettle refugees.

While this system was effective in alleviating some of the pressure on neighboring countries, by 1989 such factors as continuing arrivals, high birth rates in the camps, and a decline in admissions to third countries led to considerable concern in the countries of first asylum. Therefore, in June 1989, the Secretary-General convened a second conference, the International Conference on Indo-chinese Refugees. The seventy-four governments that attended the conference adopted the Comprehensive Plan of Action [CPA] that called for: controls on clandestine boat departures from Vietnam; an expanded Orderly Departure Program for legal exit from Vietnam; guarantees of safe arrival and humane treatment for Vietnamese and Laotian asylum seekers by neighboring countries; a region-wide refugee status determination process; continued resettlement abroad; and the eventual return of nonrefugees to their countries of origin (Knowles 1989).

As of August 31, 1993, there were approximately 110,000 Indochinese in UNHCR camps throughout Southeast Asia; 742,000 Vietnamese, 235,000 Cambodians, and 300,000 Laotians had been resettled. Through the CPA approximately 46,000 Vietnamese, 23,000 Cambodians and 14,000 Laotians had repatriated. The CPA is an example of how the international community, working with the countries of a region, can collaborate to distribute the burden of responding to an migration emergency.

Unsuccessful Attempts to Internationalize the Haitian Migration Crisis, 1991-1994

The immigration emergencies from Cuba and Haiti in the past two decades have been viewed by other nations almost exclusively as an United States problem. Efforts to internationalize the migration aspect of the crisis in Haiti since the overthrow of President Aristide demonstrate the tremendous challenge of brokering an international program of burden-sharing. At a meeting held at the Organization of American States [OAS] headquarters in Washington on November 19, 1991, the UNHCR asked Caribbean states to take screened-out Haitians. Venezuela took 100, Suriname 60, and Honduras 250. Without success, the United States also searched for alternative sites for temporary camps in Jamaica, the Bahamas, the Turks and Caicos Islands, and the Dominican Republic. One senior Administration official stated that other countries would not share in the burden without an economic incentive, "Nobody is going to take them off our hands without getting something in return."

With prospects for a political settlement to the Haitian stalemate looking increasingly grim in 1993, the UNHCR renewed its efforts to find an international solution to the plight of those wanting to flee Haiti. UNHCR offered to establish one or more regional processing centers for Haitians in the Caribbean. Modelled on the Comprehensive Plan of Action, this would permit UNHCR to screen Haitians for a fear of persecution in accordance with international standards. Those who were screened in would be resettled, those who were screened out would be given temporary safe haven at the center or elsewhere in the region.

INTERDICTION

In situations where people are fleeing by boat, interdiction allows the U.S. to control the movement of migrants before they reach U.S. shores. In the past twelve years, the United States' policy of interdiction, whereby the Coast Guard intercepts boats on the high seas, has affected nationals from China, Cuba, the Dominican Republic, and Haiti. Between 1981 and 1993, the U.S. Coast Guard interdicted 3,188 Chinese, 7,142 Cubans, 5,256 Dominicans, and 66,122 Haitians. Upon interdicting migrants, the U.S. can (1) bring them to the United States, (2) return them to their country of origin, or (3) bring them to a third location for temporary protection. The fate of those interdicted has

varied depending largely on the country that they have left. The clearest example of this differential treatment is the contrast between the reception of interdicted Haitians and Cubans. Haitians are returned directly to Haiti. Most Cubans are brought to the U.S. and given automatic parole.

As the United States' interdiction policy was first established in response to the threat of massive numbers of Haitians arriving in the United States and continued to evolve as such, this section focuses primarily on the interdiction of Haitians.

History of Interdiction

One of the only early recorded incidents of interdiction was of the *St. Louis* in 1939. The *St. Louis* carried 1,128 German Jews who went to several points in the Western hemisphere, including the United States, seeking asylum. As the ship approached the United States, a Coast Guard cutter patrolled the waters off the Florida coast to prevent any passengers from attempting to come ashore. The passengers wired a plea for admission to President Roosevelt who did not respond. The State Department decided that no one without a visa would be allowed to enter the U.S. As no one on board had a visa, the *St. Louis* returned to Europe where some of its passengers were killed by Hitler (Zucker & Zucker 1987).

In part because of the experience in Nazi Germany during the Holocaust, U.S. policy regarding refugees shifted in the years following World War II. A number of special laws established programs permitting the entry of displaced persons, Hungarians, Cubans, and Indochinese. In 1980, after four decades of *ad hoc* arrangements, the Refugee Act of 1980, which adopted the U.N. definition of refugees and a process for the orderly admission of refugees from abroad, was passed. The law also contained a brief reference to asylum in the United States, a provision tested soon after the law's passage by the Mariel boatlift of Cubans. At the same time, advocates of asylum for Haitians urged that their cases be reviewed under the new legal framework and that Haitians be granted the same special status given to the Cubans. Toward the end of 1980, the flow of Cubans had all but stopped. Haitians continued to arrive by boat, however.

On September 23, 1981, through an exchange of letters between the U.S. government and the Haitian government of President Duvalier, the two countries agreed to the "establishment of a cooperative program of interdiction and selective return to Haiti of certain Haitian

migrants and vessels involved in illegal transport of persons coming from Haiti."[1] On September 29, 1981, President Reagan issued an executive order expressing concern for the "continuing problem of migrants coming to the United States, by sea, without necessary entry documents . . ." and stating that the Secretary of State "shall undertake to enter into, on behalf of the United States, cooperative arrangements with appropriate foreign governments for the purpose of preventing illegal migration to the United States by sea" (Reagan 1981a).

The interdiction agreement stated that the United States "does not intend to return to Haiti any Haitian migrants whom United States authorities determine to qualify for refugee status." Therefore, during the period from 1981 to 1991, interdicted Haitians were brought on board Coast Guard cutters and interviewed by INS officials to determine whether or not they had "a credible fear" of persecution. The "credible fear" standard is more lenient than the "well-founded fear" standard that must be met to qualify for political asylum. According to one INS officer, a more generous standard on the cutters was used as a procedural safeguard to compensate for the difficult conditions under which the applicants were presenting their claims. Of the 24,600 Haitians screened on the cutters during that period, only 28 were allowed to enter the United States to seek asylum (US GAO 1992). Those who did not meet the "credible fear" standard were returned to Haiti.

Following the September 30, 1991 coup that overthrew President Aristide, the number of Haitians fleeing by boat exceeded the capacity of the Coast Guard cutters to accommodate them during the screening process. In November 1991, the U.S. government established an emergency camp at the U.S. naval base on Guantanamo Bay, Cuba, where the INS screened Haitians with the "credible fear" standard that had been used on the cutters since 1981. (A fuller discussion of the reception of Haitians on Guantanamo is provided below.)

On January 19, 1978, the National Security Council issued a Presidential Directive [P.D. 27] calling for interagency discussion and decisionmaking when nonmilitary incidents that could adversely affect foreign relations occur. In the case of interdiction, when a Coast Guard ship interdicts a vessel carrying undocumented migrants, the passengers are held until an interagency decision is made on how to handle the case. The Coast Guard initiates the interagency call, recommending to the other agencies the action that it believes to be appropriate. The discus-

sion involves the Coast Guard, State Department, Justice Department, and, at times, the National Security Council. In arriving upon an interagency decision, the various agencies weigh in with their respective operational, legal, and diplomatic concerns. P.D. 27 is not invoked in the case of interdicted Haitians as that policy is based on the 1981 agreement between the two countries and the foreign policy implications, therefore, do not need to be assessed case-by-case. As the U.S. does not have such an agreement with any other country, the interdiction of nationals of any other country is, therefore, implemented according to P.D. 27.

A major turning point in the U.S. interdiction policy was the May 24, 1992 Executive Order issued by President Bush that revoked the 1981 Executive Order and replaced it with expanded authority to "suspend the entry of aliens coming by sea to the United States without necessary documentation . . ." and "to repatriate aliens interdicted beyond the territorial sea of the United States." A controversial aspect of the implementation of this order is that Haitians no longer were given the opportunity to present their claim to asylum as they had been in the previous eleven years. Instead, those interdicted were returned directly to Haiti. Despite campaign promises to end interdiction, which he characterized as a "callous response to a terrible human tragedy," on January 14, 1993 President-elect Clinton announced that he would continue the policy on a temporary basis. Far from moving away from Bush's interdiction policy, the Clinton Administration has reinforced it with additional ships and resources. In January 1993, the U.S. increased the presence of U.S. Coast Guard cutters, Navy ships, and helicopters to blockade the island and prevent refugee flight (National Coalition 1993). Under Operation Able Manner, as the blockade is named, the Coast Guard deployed as many as twenty-two vessels at one time to surround Haiti and contain anyone trying to leave.

While interdiction has affected Haitians more than any other group, it is increasingly being used to control the movement of other groups of migrants. On July 6, 1993, the Coast Guard intercepted three ships in international waters southwest of San Diego. The vessels were carrying 658 Chinese emigrants. This incident came in the wake of heightened public outcry over alien smuggling, precipitated by the June arrival of the Golden Venture, a ship carrying 300 Chinese immigrants who had paid to be smuggled into the United

States. When the ships arrived off the coast of California, the U.S. asked Mexico to accept the U.S.-bound Chinese for processing. Vice President Gore described this action as a "no nonsense response to this wave of criminal smuggling of illegal immigrants into the US. They will be given careful attention under the law, and those who do not have legitimate requests, and historically that has been the vast majority in these cases, will be returned directly to China." Mexico eventually agreed to accept the Chinese for processing and most of them were returned to China within a week.

Justification and Legality of Interdiction

The U.S. government traditionally has justified interdiction by emphasizing that it is aimed at curbing illegal immigration. In a proclamation issued on the same day as his 1981 executive order on interdiction, President Reagan stated that:

> . . . the ongoing migration of persons to the United States in violation of our laws is a serious national problem detrimental to the interests of the United States. A particularly difficult aspect of the problem is the continuing illegal migration by sea of large numbers of undocumented aliens into the southeastern United States. These arrivals have severely strained the law enforcement resources of the Immigration and Naturalization Service and have threatened the welfare and safety of communities in that region (Reagan 1981b).

The U.S. government also has interdicted Haitians out of concern for the safety of migrants risking their lives in boats. In announcing his decision to continue the interdiction policy in 1993, President Clinton stated that "boat departures will result in further tragic losses of life" (Clinton 1993). The Coast Guard also has noted the danger involved in fleeing Haiti by boat. One Coast Guard lieutenant commander explained that the Caribbean waters are unpredictable and that it is "common to have beautiful sunny weather when you leave and a short distance away localized heavy thunderstorms with forty-mile-per-hour winds and fifteen-foot seas." He explained that many of the Haitians fleeing are from rural areas and have no nautical experience. "They are crammed in horrible conditions with inadequate food, water, and sanitation." In the late 1980s, another Coast Guard official reported that "50 percent of the sail-

boats departing from Haiti never land, capsizing or foundering with total loss of life" (*Refugee Reports* 1987). The U.S. government's concern for the safety of those fleeing Haiti by boat is, therefore, clearly not unfounded.

An internal UNHCR memorandum of October 29, 1981 documents the agency's early concern about interdiction by noting that "whether or not the measures [interdiction] can be challenged from a legal point of view is not certain. The newly introduced interdiction measures, of course, deprive asylum seekers of access to counsel and of the appeal possibilities which they would have had they entered the USA . . . the new interdiction measures could certainly constitute an undesirable precedent for other areas of the world" (Shawcross 19??).

After months of lower court battles over interdiction and forced return, on June 21, 1993, the policy was upheld by the Supreme Court. The eight-to-one decision concluded that the policy was legal under U.S. immigration law and that it did not renege on the U.S.'s obligations as a signatory to the 1967 U.N. Protocol Relating to the Status of Refugees. One of the central points raised by the plaintiff was that the interdiction policy violated Article 33 of the 1951 Refugee Convention and its 1967 Protocol, which states, "No Contracting State shall expel or return a refugee in any manner whatsoever to the frontiers of territories where his life or freedom would be threatened on account of his race, religion, nationality, membership of a particular social group, or political opinion."

The majority held that protections against forced repatriation of refugees apply "only to aliens who reside in or have arrived at the border of the United States." It, therefore, did not apply when the Coast Guard interdicted vessels outside of U.S. territorial waters. The majority also noted, however, that while repatriation did not violate the letter of the law, it may violate its spirit: "the drafters of the Convention . . . may not have contemplated that any nation would gather fleeing refugees and return them to the one country they had desperately sought to escape."

The lone dissenter, Justice Harry Blackmun argued that:

> . . . the refugees attempting to escape from Haiti do not claim a right of admission to this country. They do not even argue that the Government has no right to intercept their boats. They demand only that the United States, land of refugees and guardian of freedom, cease forcibly driving them

> back to detention, abuse and death. That is a modest plea, vindicated by the Treaty and the statute. We should not close our ears to it.

In response to the decision the UNHCR stated that "This decision is contrary to the views of UNHCR's Executive Committee that refugees should not be refused entry to a country where they are seeking asylum, and that asylum seekers rescued at sea should always be admitted, at least on a temporary basis. . . . UNHCR considers the Court's decision a setback to modern international refugee law" (UNHCR 1993).

IN-COUNTRY PROCESSING

Like interdiction, in-country processing aims to avert a potential immigration crisis by directing the flow of migrants before they reach U.S. shores. In-country processing is similar to overseas resettlement processing in that both of these programs determine whether or not a person is a refugee before he or she enters the United States. This differs from the affirmative asylum process that makes such a determination after a person is already in the United States. Admissions through both in-country and overseas refugee processing fall under the refugee ceilings set annually by Congress in consultation with the Administration. The principal difference between in-country processing and the resettlement program is that in the former, applicants are still within the country where they fear persecution, whereas in the latter, they have already reached the safety of a first country of asylum. The United States has in-country refugee processing programs in the former Soviet Union, Cuba, Vietnam, and Haiti. It also has participated in in-country processing programs run by the International Organization of Migration [IOM] in Chile, Argentina, Nicaragua, El Salvador, and Bolivia.

Critics of in-country processing point out that the people most in fear are the very ones who likely would be too afraid to come forward with a persecution claim. People in fear might mistrust an in-country processing program's intentions, fearing that it could be a device for identifying subversives. After exposing themselves, applicants have no guarantee of escaping from the country. Proponents of in-country processing argue that it allows for the humane and orderly departure of legitimate refugees. They also point out that it avoids the arrival of large numbers of asylum seekers in the United States

where, due to backlogged and protracted asylum procedures, they can remain for years without ever having established their claim to asylum.

Orderly Departure Program for Vietnam

The April 1975 collapse of the Republic of Vietnam uprooted thousands of people. By the end of the 1970s, thousands of Vietnamese boat people were journeying across the South China Sea to find refuge in squalid camps throughout Southeast Asia. It will never be known how many perished at sea during their attempts to escape. It became clear that an alternative to the dangerous and uncontrolled flight of Vietnamese boat people had to be found. The United States worked with the UNHCR—and through the UNHCR with the Government of Vietnam—to establish a ore ordered, legal means of departure. The resulting U.S. Orderly Departure Program [ODP] began operations in December 198-0 (Migration and Refugee Services 1986; aynes 1992). Those wishing to participate in the program first needed to obtain an it permit from the Vietnamese Minist y of Internal Affairs. Applicants w uld then be transported to the U.S. embassy in Bangkok where U.S. consular officers would make the determination as to whether or not to issue a U.S. entry visa.

A few months prior to the inception of the ODP, in May 1980, a U.S. presidential determination (No. 80-17) was issued allowing Vietnamese "with past or present ties to the United States" to be considered "refugees of special humanitarian concern to the United States even though they are still within their country of nationality or habitual residence." (The determination also applied to present and former political prisoners and their families in Argentina and Cuba.) The U.S. established criteria for categories of people eligible for the program: Category 1, family members of persons in the U.S. not currently eligible for immigrant visas; Category 2, former employees of the U.S. government; and Category 3, other persons closely associated or identified with the U.S. presence in Vietnam prior to 1975. Amerasians and their immediate family members fell under this third category. By the end of 1992, more than 300,000 Vietnamese had departed for the United States via the ODP. This included 161,400 family reunification cases, 81,500 Amerasians and their relatives, 61,500 former political prisoners and their families (US Committee for Refugees 1993).

In-Country Processing in Cuba

The U.S.'s in-country processing program in Cuba is based on a 1984 migration agreement between the U.S. and Cuban governments that established procedures for U.S. processing of nonimmigrant and immigrant visas, as well as of refugee applications. Cuba, to show its opposition to Radio Marti, unilaterally suspended the program almost immediately after its inception. The processing program, therefore, did not begin to operate fully until the Cuban suspension was revoked in November 1987. It operates out of the U.S. Interests Section in Havana. Those applying for refugee status must fall into one of the following seven categories: former political prisoners; members of persecuted religious minorities; human rights activists; forced labor conscripts; persons who have lost their professional credentials and are unable to practice their profession because of their political activity; dissidents; or other refugees of compelling concern to the United States.

In-Country Processing in the Former Soviet Union

Under the Lautenberg Amendment to the Foreign Assistance Appropriations Act for FY 1990, selected groups of Indo-chinese and Eastern Europeans with a "credible fear of persecution" can qualify for refugee status. To be eligible for in-country processing in the former Soviet Union, an applicant must fall into one of the categories given special consideration under the Lautenberg Amendment: Soviet Jews; evangelical Christians; members of the Ukrainian Catholics and Ukrainian Orthodox religions. The in-country processing program that the U.S. operates in the former Soviet Union gives priority to those who fall into one of the Lautenberg categories with close family members in the United States. Since the in-country processing program began in 1989, 750,000 preliminary applications have been received. The program has brought approximately 250,000 people to the United States.

In-Country Processing in Haiti

In February 1992, in-country processing began at the consular section of the U.S. embassy in Haiti. The program was established to facilitate the exit of those most likely to face persecution, such as high-ranking officials from the Aristide government, Aristide's bodyguards, and pro-Aristide academics. Since May 1992, when the U.S. government began its policy of interdicting Haitian boats and returning

them directly to Haiti without an opportunity to make a claim to asylum, the in-country processing program has served as the only means by which Haitians can apply for asylum in the United States (unless, they are able to slip through the blockade and arrive on U.S. shores without being interdicted). The critical difference between in-country processing in Haiti and its use in other countries is that, coupled with interdiction, in-country processing in Haiti acts as a deterrent to the immigration emergency that could ensue if departure from the island were unrestricted during this period of political instability. In contrast, the ODP was established under emergency circumstances similar to those in Haiti when thousands of people were risking their lives in boats, but Vietnamese who fled by boat were not turned back because the ODP existed (Frelick 1993).

In October 1992, the IOM, under contract with the State Department, assumed the responsibility of running the in-country processing program from an office outside of the embassy. According to the State Department, one reason for this transfer was that the high security at the embassy did not offer the unintimi- dating atmosphere that would make fearful people feel safe enough to come forward with their refugee claims. An American Immigration Lawyers Association [AILA] delegation that went to Haiti in January 1993, reported that the IOM office was threatening because it is close to the police headquarters and has very intimidating security—applicants must pass through two layers of Haitian guards. The State Department counters that those guards work for the IOM and offer a level of security that is appropriate to the situation.

The in-country processing program operates on a vetting system that determines the level of priority of each application. While the State Department oversees the vetting of applications, the INS makes the final determination as to whether applicants are allowed to go to the United States as refugees. Those determined to have valid claims are admitted to the United States within the refugee ceiling set annually by Congress. Between February 1992 and January 1994, the program's vetting system consisted of three categories. The "A" category was for likely targets of persecution, such as officials in the Aristide government, academics, and journalists. The "C" category was for those who, as one State Department official put it, "want to work in Miami." The "B" category was for those who fell in the middle, such as those who do not appear to fear individual persecution but rather fear generalized violence in their neighborhoods.

In January 1993, the U.S. government resolved to work within Haiti to restore democracy, protect human life, and improve in-country processing. A technical team consisting of representatives from the INS and the State Department, as well Members of Congress, travelled to Haiti to look at ways to improve in-country processing. Their recommendations, which have now been implemented, were:

1. To double the capacity of the in-country processing from 100 to 200 per week (i.e., that IOM would interview enough applicants for the INS to adjudicate 200 per week);

2. To streamline the in-country processing for Category A so that the INS interviews A applicants the very day that they submit their application and they can be fully processed and ready to leave Haiti within seven days;

3. To open regional processing centers in rural areas where people find it difficult to travel to the IOM office in the capital (two such programs were set up in the spring of 1993 in Les Cayes and Cape Haitian and are being run by nongovernmental organizations, World Relief and the U.S. Catholic Conference respectively);

4. To provide additional security to those afraid to go to the processing centers, including IOM hiring of a human rights liaison person to remain in contact with the Haitian human rights community for alerts on cases of people in particular fear or danger;

5. To pass out a preliminary questionnaire to returnees on cutters, and then upon their return, the Refugee Coordinator and his staff go onto the cutters and prioritize the questionnaires, taking those in category A directly to the INS for processing.

The U.S. Government's justification for this program is that it enables legitimate refugees to leave the country without risking their lives in boats. Following a Federal Appeals Court decision in March 1992 to suspend the forced return of Haitians (later overturned by the Supreme Court), one Justice Department official stated, "The Administration remains convinced that in-country processing is the most equitable and humanitarian way to deal with this situation. We are extremely concerned that as a result of today's actions, Haitians may be lured into embarking on dangerous journeys on the high seas in the false hope of reaching the United States" (Washington Post 1992).

The three categories of the vetting system were abolished in January 1994, and they were replaced by a more narrow set of criteria. As of January 31, 1994, to be eligible for in-country processing, a person must fall into one of the following groups: former senior or mid-level members of the Aristide government; close Aristide associates; journalists or educational activists who have experienced significant or persistent persecution; highly visible members of social, political, or development organizations that have experienced persecution or significant harassment by the *de facto* authorities; or others of compelling concern to the U.S. because they are in immediate danger.

Some who criticize the in-country processing program in Haiti hold that in-country processing in itself is not necessarily harmful. It is when it is the only means of protection that it becomes a dangerous tool of containment.

TEMPORARY PROTECTION AT OFFSHORE LOCATIONS

One objective of planning for immigration emergencies is to avoid the economic, political, and social problems that can result when an influx of migrants suddenly arrives, overwhelming the local capacity to absorb them. A middle ground between sending all migrants involved in an immigration emergency back to their country of origin and admitting them all into the United States, is to provide temporary protection and refugee processing at an offshore location. In 1975, the U.S. temporarily housed fleeing Vietnamese on Guam, and at the time of the Mariel boatlift some Cubans were temporarily accommodated in Puerto Rico. The United States' experience of temporarily housing Haitians at the U.S. Naval Base at Guantanamo Bay, Cuba provides insights into how this option may be used in the future.

Within the first few months after the September 1991 coup in Haiti, the Coast Guard cutters being used for INS screening became overwhelmed and an alternative location for conducting the interviews needed to be found. In November 1991, the U.S. government dispatched a military task force to erect an emergency camp at the U.S. Naval Base at Guan-tanamo Bay. Once the Guantanamo site was established, the Coast Guard brought the intercepted Haitians to Guantanamo for screening rather than keeping them on the cutters.

During the course of the next seven months, approximately 12,000 Haitians were picked up by the Coast Guard and brought to Guantanamo. A number of problems developed during this period that led the U.S. government to decide to close the camp in May 1992. First, the U.S. government became concerned that by picking up Haitians at sea and bringing them to Guantanamo, the U.S. was encouraging increasing numbers to flee. One State Department official pointed out that Haitians were beginning to leave Haiti in boats that were not fit to take them to Miami but rather were intended only to take them a few miles off the coast of Haiti where they knew they would be picked up by a Coast Guard ship.

A second problem was that the number of Haitians needing accommodation on Guantanamo soon exceeded the capacity of the facilities that the U.S. had set up to receive them. The Administration explored a number of options to try to alleviate the problem of overcrowding, ranging from expanding the facilities on Guantanamo to accelerating the process of repatriation. The Administration also made diplomatic efforts to persuade other governments to accept some of the overflow. In June 1992, the Administration ultimately decided to close the camp. Between the November 1991 opening of the camp at Guantanamo and its closing, the INS prescreened 36,596 cases there. Approximately 11,000 were screened in and allowed to pursue asylum claims in the United States. With a few exceptions, who were allowed into the U.S. for medical reasons, the remaining screened out Haitians were returned to Haiti.

JANUARY, 1994

U.S. COMMISSION ON IMMIGRATION REFORM

The massive refugee resettlement of Indochinese boat people spurred Congressional action on the Refugee Act of 1980. The Act, however, was rooted in more than the immediate challenge of resettlement resulting from the pledges made by the United States at the Geneva Conference of 1979. The original version of the bill introduced in the Senate by Senator Edward Kennedy of Massachusetts was aimed at addressing the longstanding issue of orderly decision making and Congressional-Executive responsibilities in determining levels of refugee admissions. Federal responsibility for the costs of refugee resettlement in the U.S. were also taken up in detail in House consideration of the bill.

The Refugee Act of 1980 was a major step in codifying the decision-making process about how many refugees to resettle in the U.S. annually and from where they would come. It also spelled out a new framework for federal-state-private voluntary agency cooperation in the reception and settlement process. The implementation of the settlement process has been controversial in many aspects, but the Act provided a working basis to address issues of refugee integration.

The ink was hardly dry on the new law, signed in March of 1980, when the Mariel boat lift crisis began. Mariel was important for many reasons but, for the purposes of this analysis, it was particularly significant as the first experience of the decade (and a searing one, at that) of what was to emerge as the most challenging refugee problem of the 1980s and 1990s for industrial countries, flows of asylum applicants.

The Refugee Act of 1980 had set up a working arrangement to address problems related to choosing refugees from overseas for resettlement in the U.S. Until Mariel, U.S. refugee policy virtually meant how to decide how many and whom, among those given safe haven in countries other than their own, to invite to settle in the United States, as well as whom to allow to come directly to the U.S. as refugees from persecution (as in the case of the former Soviet Union).

The Refugee Act of 1980 solved a past problem but did not address the emerging issue of asylum applications. The Act took some note of asylum, but almost in a passing way. It authorized up to 5,000 persons approved for asylum in a given year to adjust to permanent resident alien status. (The number of asylum applications—some applications include many family members—in 1992 was 103,946.)

The number authorized in the legislation to adjust to immigrant status had no par-

ticular basis, according to recollection of Congressional and Executive staff who worked together on drafting the legislation. It seemed more than sufficient for the trickle of persons who sought asylum, be they defectors of strategic value, prominent athletes and artists, crew members who sought refuge, or others. Others includes those who sought to stay in the United States when, due to their prior political activities, religious beliefs, or ethnicity, political turmoil left them stranded and in danger if they returned to their country. The law took no note of the possibility of acute, mass asylum movements, that is, large numbers coming in a short period with little notice or preparation.

The United States was not alone in facing the challenge of asylum. Other industrial countries, notably in Europe, encountered similar increases in asylum applications in the 1980s. Many of the stronger economies of Western Europe had relied on temporary labor (guest workers in the translation from the German) to help their economies recover from wartime devastation and grow spectacularly in the late 1950s and 1960s. Some hesitations were voiced about the economic wisdom and, especially, the social costs of temporary labor programs. As early as 1968, Switzerland held a referendum about reducing temporary worker reliance due to "over-foreignization."

The oil boycott of 1973 and the subsequent economic downturn found European labor importers ending the practice. Some countries developed programs to encourage the noncitizen labor to return home. Most of these incentive programs, however, were not successful in spurring significant returns. There was reluctance to develop a wholesale deportation policy, due probably to a combination of structural reliance on the "temporary" workers to perform permanent jobs (and so opposition of employers to a wholesale deportation policy) and objections from sectors of the public in these European liberal democracies on equity grounds.

Although the issuance of new work permits virtually halted, in many cases workers in place were permitted to stay and allowed to reunite their families in Europe. Many social problems developed related to citizenship, education, minority group status, employment and training opportunities, housing, and so on. The type and severity of the issues varied by country and the origin of the worker population. Every European country with the remnants of a guest worker program

faced some significant social and political problems related to the sequelae of migrant worker programs.

With the ending of fresh recruitment into the ranks of temporary labor, Europe faced an increase in undocumented or illegal migration. Attempts to reduce or control the level of illegal migration had some, albeit limited, success. In the 1980s asylum seeking became an alternate to illegal migration, which itself had developed as a substitute for temporary labor programs.

Note that the cycle of events in Europe gives support to the hypothesis that, given supply of and effective demand for labor, change in policy to restrict one migration channel will result in pressure for other modes of entry. Ending temporary worker recruitment after 1973 led to increased illegal migration. Crackdowns on illegal migration, including fines for hiring illegal migrants, led to pressure on the asylum system as a means of entry for those who in large part are labor migrants. The logic would lead to the prediction that the current attempts to restrict access to asylum procedures by manifestly unfounded applicants will result in a new round of increased illegal migration in Europe.

Most Western European countries are signatories to the Geneva Convention of 1951 on the status of refugees and the 1967 New York Protocol that removed the temporal and geographic referents in the refugee definition of the 1951 Convention. Western European countries have asylum adjudication systems and a strong commitment to asylum, in no small part in reaction to Nazi-era experiences. The commitment to asylum, like that in the United States to refugee resettlement, primarily was expressed in reception from Communist countries in the East of Europe. Since Communist governments' exit policies were strict, the flow of asylum seekers until the 1980s was generally not great and not perceived to be out of control.

Around 1984, the large movement of Iranian asylum seekers from Turkey, the increase noted in Third World asylum seekers coming through the Warsaw Pact countries, and the threat of terrorism led to initial meetings among Western European states about asylum in Europe.[1] As asylum became a route for entry in Europe, states perceived the flows as increasingly

[1] For a review of events in Europe around multilateral discussions of asylum see: Russell, S.S.; Keely, C.B. Forthcoming. The Diplomacy of Multilateral Efforts to Harmonize Asylum Policy Among Industrial Countries. In *Towards a New Refugee Regime* (R. Rogers, S.S. Russell, eds.).

an abuse of the asylum system. The vast majority of asylum seekers were found not to qualify as refugees under the Convention and Protocol. An asylum system is to provide protection for politically persecuted people, not to be an alternate route to the European labor market.

European governments continue to wrestle with policy and programs related to individuals arriving in Europe and applying for asylum. More recently, acute flows (large numbers in a short time) of European asylum seekers due to war and political turmoil have been added to the more individualistic asylum flow. Italy felt the impact with the boat loads of Albanians seeking asylum during the overthrow of the former, extremely repressive government. Currently, many people from former Yugoslavia find haven within its former components, now new countries (e.g., Bosnians in Croatia). Large numbers have sought and found a temporary haven in Germany, Austria, Switzerland, and Sweden. In both the Bosnian and Albanian cases, calls by the recipient countries for burden sharing in providing a safe haven, especially by other European countries, have fallen on deaf ears. The potential of additional flows from Central Europe and the former Soviet Union continues to worry European capitals.

In short, Europe faces large-scale asylum flows from both individuals (coming to the country and asking for asylum on entry or if detained for migration irregularities) and mass flows in concentrated periods of people escaping violence.

The United States continues to face both sorts of asylum seekers. (The U.S. NAFTA partners share in these pressures to some extent already and perhaps increasingly in the future.) The Mariel flows represented a large inflow in a short time, similar in that respect to the recent Albanian and former Yugoslav cases of Bosnians and Croats. During the 1980s, the U.S. also received an increasing number of asylum applications at ports of entry.

Central Americans, especially from El Salvador and Nicaragua, and more recently from Guatemala, have come in continuous streams of significant size. While many applied for asylum, many did not. The interpretation of their failure to apply varies between their fear of being turned down by an unfair, politically tainted adjudication system and their disinterest because they are economic migrants who know they do not qualify for asylum.

In addition to the individual asylum seekers arriving at points of entry or requesting asylum at time of arrest for immigration offenses, and besides the Central Americans whose entry is related to political events (even if they do not qualify under the Convention definition contained in U.S. law), the U.S. continues to face the threat of large-scale, time-concentrated asylum flows from Cuba and Haiti.

The recent arrival of boats of Chinese asylum seekers raises the additional specter of continuous flows from a distant country where the U.S. desire for normal relations, including trade, and the questionable human rights situation present difficult problems. Even if the boat loads of Chinese are economic migrants caught in a sophisticated international smuggling business, the return of such persons raises human rights issues if their government punishes them for exercising what the Universal Declaration of Human Rights of 1948 declares to be a basic right, to leave and reenter one's own country.

Table 1 indicates the level and sources of asylum applicants to the United States from 1980-1993. The data give an idea of current demands on the asylum adjudication system. Asylum seekers' applications are decided by an asylum officer corps specially trained to judge the *bona fides* of the cases. The 1980 Refugee Act mandated an asylum officer corps, but it took a decade to establish the corps and supporting services to provide political, human rights, and other information necessary to judge the facts presented to adjudicators in specific cases.

Asylum adjudication systems like that in the United States were established in a number of industrial countries in the 1980s. The U.S. system was helped in many ways by the Canadian experience in establishing an asylum system. A goal of these programs is to establish an adjudication process that is and is perceived to be fair, independent of immediate foreign policy interests of the sitting government, and reasonable in the outcome of cases.

These objectives fulfill two desiderata. Democratic governments want to encourage human rights values in other societies as ends in themselves and as a basis for trade, diplomatic, and other state-to-state interaction. Second, public opinion in democratic countries objected to asylum systems perceived as virtual captives of Cold War (especially anti-Communist) policy, with scant attention to persecution by rightist governments. Citizen groups

Note: The Refugee Act of 1980 went into effect on April 1, 1980. The pending beginning of fiscal year 1990 does not match the pending end of fiscal year 1989 due to changes in the processing of Soviet refugees residing inside the Soviet Union. The figures beginning fiscal year 1990 exclude the initial questionnaires submitted by refugee applicants residing in the former Soviet Union. The number of applications for refugee status pending at the beginning of fiscal year 1992 has been revised upward from the 17,555 reported at the end of fiscal year 1991. The increase of 683 applications is due to revision in the data from one reporting office.

Source: INS. 1994. *1993 Statistical Yearbook*.

in the U.S. and elsewhere pressed governments to develop human rights policies with a single standard for friends and enemies alike.

The U.S. asylum adjudication system has been adjusting to a heavier workload of individual asylum applications at ports of entry or after arrest for immigration violations. The workload of the asylum adjudication corps was impacted tremendously by the addition of Central American asylum seekers as a result of the American Baptist case and by the 1990 Immigration Act's mandating of rehearing of some cases.

It is important not to minimize the caseload problem and the resource requirements needed to avoid incessant "catch-up" (the image of Sisyphus comes to mind). While the problem of resources to dig out from the current backlog and workload needs attention, there is general support for a set of procedures that are fair, independent, and contribute to maintaining a global standard of protection from political persecution.

Two other issues remain. First, is adherence to the Convention definition adequate to meet the needs of those innocently escaping violence, especially the violence of war or civil unrest, even if they are not personally persecuted? Should an asylum option that does not automatically assume permanent settlement be developed for such situations by the U.S. and industrial countries generally? This is the familiar issue of the adequacy of the refugee definition and the accompanying problem of how to accommodate truly temporary asylum with effective return or removal policies when political conditions allow for safe return.

The second issue is what to do in the face of acute, mass asylum flows, like those during Mariel and feared during recent years' events in Haiti?

These two issues are analytically distinct but are related in concrete cases. Each will be addressed in turn, with attention to their intersection in possible mass movements to the U.S. in the foreseeable future.

The Conditions of Asylum

Despite the adoption of the international (Convention- and Protocol-based) definition of a refugee in the Refugee Act of 1980, the U.S. still feels the legacy of anti-Communism in refugee programs. Until the reform of refugee law in 1980, the

definition of a refugee in U.S. statutes referred to persons from a Communist-dominated country and certain areas of the Middle East. Even with the change in definition, inspection of the proposed and actual admissions of refugees under the 1980 Act reveals a dominance of resettlement of citizens from countries with Communist governments.

Currently, the lion's share of proposed admissions to the U.S. are from the former Soviet Union and Vietnam. These figures to a large extent represent redeeming past promises. They are based not only on foreign policy considerations like maintaining trust in the word of the U.S., but also on domestic considerations about constituency support for continued admission of certain groups. The continued salience of the Cold War is also evident in legislation allowing refugee status to people from Cuba, a remnant of U.S. policy preference not accorded citizens of other countries.

On the other hand, the U.S. is quite strong in its policy position that asylum applicants should meet the Convention criteria and that the United States does not support an expansion of the international definition. The U.S. does supply funds to the UN High Commissioner for Refugees [UNHCR] for protection and assistance activities in countries that accept a broader definition of refugee, such as those in the Organization of African Unity Convention and the Cartegena Declaration as it applies to Central America. In both these instances, persons fleeing war or civil disturbance are afforded international protection under UNHCR auspices with U.S. financial support. Policy to help finance international agencies to provide protection and assistance is a different matter than policy to accept persons for permanent residence in the U.S. In Europe, Germany, Austria, and Switzerland receive Bosnian refugees and provide (at least for now) a purported temporary safe haven with an expectation of return. The decision is based on providing safety from war and is provided generally without inquiry into meeting Convention definitions.

During the 1980s, the U.S. policy was to review asylum applications (which would result in permanent settlement in the U.S.) on the basis of meeting the Convention definition. Especially in regard to applications from Central America, this resulted in very low acceptance rates. Low acceptance rates, in turn, provided the basis for the claim that asylum seekers were economic migrants. That they were fleeing devastation of war, massive civil unrest, or gross human rights violations (with or without complicity of parts of the U.S. military, intelligence, or diplomatic agencies) was presented as not relevant to

asylum policy, unless and until the refugee definition of political persecution were altered to extend beyond the individual victim of persecution. The successive administrations of both Democratic and Republican parties opposed extending the refugee definition to include those fleeing the general danger of war or unrest.

An honest analysis of the dynamics of the political differences on Central American policy concludes that to some extent the criticism of asylum policy in the 1980s was a proxy for opposition to U.S. policy in Central America. The U.S. government was accused of double standards on human rights, complicity in human rights violations, and lack of responsibility toward victims of a policy of material, military, and diplomatic support to the governments accused of large-scale human rights violations.

Conversely, discussion of inadequacies of asylum and refugee definitions, policy, or behavior (including an asylum adjudication system reflecting current foreign policy that continued for almost a decade before the development of an independent asylum officer corps) was dismissed by supporters of U.S. Central American policy as nothing but a smoke screen for political opposition to that policy. Opponents of Central American policy carried the burden of being presumed to be naive or fellow travellers for Communist expansionist policies. Discussion of refugee and asylum policy (and Central American policy) was poisoned by these sorts of views.

This state of affairs, in tandem with the logistical problems of providing for reception and maintenance of mass movements like the Mariel experience (to be discussed below), has resulted, since the early 1980s, in an unstated policy that the U.S. is not a country of mass first asylum. The Convention definition has been rigorously applied, in deep contrast to prior mass determinations to accept escapees from Eastern Europe or the Soviet Union (including Hungarians in 1956 and asylum seekers after the Czech Spring), Cubans, and Indochinese. In those cases, to have been in their own countries was considered persecution enough. To escape was to merit asylum and resettlement. The United States as late as 1989, in discussions of the Coordinated Plan of Action [CPA] for Indochina, insisted that those denied asylum under processes monitored by the UNHCR in Hong Kong were not to be returned to Vietnam.

The contention that implicit U.S. policy since Mariel has been that the U.S. is not a country of first asylum is borne out by rejection rates of Central America asylum seekers and by the policies of in-

terdiction and, more recently, return without review of Haitians picked up on the high seas who wish to claim asylum. The reported demarche to Cuba not to interrupt the 1992 U.S. elections lends further support to this thesis. Even in the case of Cuba, the U.S. has not encouraged or given signs of support for large-scale emigration, despite domestic support for accepting escapees as an indication of continued opposition to Castro.

The debates on Central American policy, including the role of asylum decisions, and the desire to avoid being a country of first asylum have created a highly charged atmosphere. No administration since the Mariel incident in the Carter presidency has supported expansion of the refugee (and, by extension, asylee) definition. Even to suggest such discussion carried policy baggage. Reasoned discussion in this atmosphere has hardly been possible. Human rights supporters and those concerned about innocent victims of war and civil unrest welcomed the establishment of the asylum officer corps as a step in support of universally applicable standards of protection from persecution. All victims of war's destruction may not be eligible for asylum, but at least those suffering or realistically fearing persecution as defined by the Convention would be more likely to receive asylum. Further, the establishment of Temporary Protective Status [TPS] in the 1990 Immigration Act moved another step in the direction of providing protection temporarily to a group of people in the United States who would face danger if required to return to their country of citizenship. But the issue of the adequacy of the refugee definition remains.

What should be the policy toward persons (inside or outside the country) seeking a safe haven from the general devastation of war or civil unrest but who are not personally the targets of persecution as specified in the Convention definition contained in U.S. legislation? The definition should not be broadened to make such persons eligible for permanent settlement in the U.S. under asylum law and procedures. It would be impossible to implement fairly or fully because the global probabilities of civil unrest in the wake of post-Cold War realignments is so great. It is logistically not possible for every citizen of any country engaged in civil or international war to become a permanent resident alien (immigrant) in the U.S. through asylum procedures. It would hamper progress in burden-sharing agreements and would be politically insupportable in the U.S. once the general public understood the dimensions of such a policy decision.

Making this recommendation does not end

the matter. Practice around the world has been to offer safe haven to war victims. It has happened in Africa, Asia, and Latin America on numerous occasions. The generosity, even if sometimes reluctant, of very poor countries to citizens of neighboring countries has been striking. In Europe, a safe haven is accorded to Bosnians in large numbers by Germany, Austria, Switzerland, and Sweden. The first three of these countries have offered temporary safe haven and not permanent settlement under their asylum procedures. (Sweden, which offered settlement, now requires a visa for Bosnians, effectively ending asylum, which means settlement or temporary safe haven for Bosnians.)

Following these examples of past and current practice, the U.S. should be open to providing temporary safe haven as necessary to the citizens of *neighboring* countries. This requires either new U.S. legislation to create such a status, including a procedure the President can invoke in consultation with the Congress, or amendment of TPS in current law. Safe haven, especially in the cases of mass movements in short periods (like the Mariel case) should provide shelter in camps for up to one year. After that, protectees should be permitted into the general population with work authorization. Three years after admission, protectees should be permitted to petition for adjustment to permanent resident alien. The three-year period is proposed as a reasonable time to test whether safe return is a plausible possibility.

For those already in the United States and in the general population as nonimmigrants (like students) or even illegally, who are judged to be in danger from war conditions if they return home, safe haven in the general population with work authorization could be provided. (The case of illegal migrants may merit consideration of safe haven in camps. The logistics and incentives inherent in this suggestion require further thought). These cases would be similar to current practice under TPS. Under a safe haven policy, these persons would be given protection for *up to* three years from the start of protection to anyone in their situation. (Thus, if a student is still in studies and on a valid student visa, he or she could be given safe haven after the student visa expired. The three-year clock would run from the date safe haven was given to people from his or her country who did not have any visa to be in the U.S.)

The phrase “up to” is emphasized to make it clear that safe haven is meant to be temporary and provided only for the time needed. The three years of protection is

not a right, regardless of events in the homeland. If events change in six months, then protectees ought to be required to return home. The proposal presumes that the usual opportunities be extended for status adjustment in cases of genuine marriages to U.S. citizens or other immigrant-qualifying circumstances.

The current TPS has been interpreted not to be applicable to persons outside the United States. Thus, it was not used for the Haitians and presumably would not be used for a massive asylum movement that was declared a migration emergency in which migrants would be accepted and even assisted to enter the U.S. by federal authorities (as for example was done in the Mariel case as it unfolded). The proposed safe haven protection could be used in cases of people outside or in the United States.

New legislation may be preferable to amending TPS because TPS carries meaning and interpretations and amendment often leads to more unforeseen consequences than necessary. TPS also is the U.S. version of European policies creating categories like Status B refugees, humanitarian entrants, persons with extraordinary leave to stay, and so on. A major problem in these cases is that there is usually no effective removal policy and little pressure on the government to use whatever good offices or persuasive powers at its disposal to work to change the conditions that led to the humanitarian gesture to offer temporary safe haven. In the U.S. case, if safe haven protectees were in a camp for a year, state authorities would surely keep the issue before the federal government. The need to decide at the end of a year to release the protectees into the general population with work authorization would at least require conscious attention to a "problem," that is, the conditions that led the government to offer safe haven. Again, at the end of two years (or whatever is deemed a reasonable period to test is return is viable), a decision and process must be undertaken to give permanent resident alien status.

The safe haven proposed here, therefore, has three aspects that improve the TPS policy. First, the procedure sends a clearer message that safe haven is meant to be temporary. It will save lives but is not intended or structured to be a route to residence in the United States.

Second, the procedures keep a safe haven population in the consciousness of federal authorities and build in incentives for federal and local authorities to urge action (in so far as is reasonable) to help change conditions in sending countries.

The safe haven procedure is not draconian and it echoes attempts of some countries to move away from immediate work authorization policies (e.g., Canada and Australia). It provides a safe haven, but in a camp. It allows for a reasonable test of whether conditions can change so that return is feasible.

Even safe haven as proposed may develop into a program in which settlement after three years is more the rule than the exception. Perhaps additional incentives need to be built in to encourage the federal government to focus on conditions that lead to giving safe haven instead of seeing safe haven as a convenient way to put an issue on the back burner. Like TPS, safe haven is a step in the direction of recognizing that providing an escape route from death and destruction during war and civil unrest is not the same as providing a new home. Unlike TPS, the safe haven proposal tries to build in criteria about lengths of stay, conditions of stay (one year in camp), and incentives for continued federal attention to do what is possible to change conditions that allow for and underscore the expectation of repatriation.

Third, safe haven is intended either for persons who find their way to the U.S. or for assisted entry.

Invoking safe haven preferably will require consultations on burden sharing with neighboring countries in anticipation of such events and close coordination in the actual event. A decision to provide a temporary safe haven is, by its nature, an *ad hoc* decision and should not be automatically triggered by criteria in a law. But offering safe haven should be clearly separate from asylum leading to permanent residence.

Such a policy would codify what some other countries' and international practice has been in terms of acceptance of victims of war and unrest, while leaving the President flexibility to judge when the safe haven would be offered. It allows for mass determinations to escape war conditions. It recognizes regional responsibilities that are a function of geography. It is not unreasonable for the bulk of safe haven granted to Bosnians to take place in Europe. Likewise, the North American partners in NAFTA can reasonably be expected to do the same for victims of war in a Caribbean or Central American country.

Unlike the European response to burden sharing on Bosnia, this proposal includes prior discussion and agreement of countries in the region about strategy and roles

(burden sharing) in the event of emergencies involving mass movements. It also has built in incentives to underscore the expectation of return. Like disaster preparedness, prior discussions cannot anticipate every detail, but they allow coordinated reaction in actual emergencies based on prior understandings and agreements.

Burden sharing agreements will take time and an emergency can happen in the meantime. That is not a reason to dismiss this recommendation. The recommendation to develop a legislative basis for temporary safe haven in camps for a reasonable period for victims of war and civil strife in this region assumes that preparedness and burden sharing discussions will be pursued with vigor in order to make safe haven a reality if necessary in the region.

Individual asylum procedures also ought to be changed so that a person granted asylum must wait for three years before being permitted to adjust status to permanent resident alien. During this time she or he should have all the rights and resources afforded refugees admitted. The distinction underlying this proposed change is that asylum should be, in the first place, temporary refuge from persecution. If events warrant return because the threat of persecution is past, then an asylee should return or be returned to his or her homeland. If, after three years, the well-founded fear of persecution remains, then a person should be permitted to focus on developing a new life in the United States.

The thrust of these two recommendations is that asylum for those who fit the Convention definition under current U.S. law and the proposed safe haven for victims of war and civil unrest are to provide temporary refuge. If events do not change in a reasonable time (three years), permanent resident status ought to be available. In the cases of acute, mass movements (perhaps literally to save life and limb), no more than a year should be spent in temporary camps and no more than three years in the U.S. before immigrant status is offered.

The hope in all asylum and safe haven situations is that conditions will permit people to resume life in their own country with safety. The proposals made here are meant to engender discussion about a proper balance between safety, incentives for victims to repatriate, incentives for the federal government to press as far as reasonable for changes in conditions leading to exit, and limiting life disruption to a reasonable level.

Acute Mass

Asylum Flows

The second issue is what to do about the possibility of mass asylum flows from Haiti, Cuba, China, or elsewhere.

The last acute asylum flow to the U.S. was Mariel. The U.S. probably did not learn as much as it could from the experience. The following recommendations are based on review of documents, interviews, and an unpublished narrative of Mariel events by Victor Palmieri, who was U.S. Coordinator of Refugees at the time.[2]

At the outset of Mariel, Palmieri was put in the chair of meetings in the White House situation room, a position for which he was unprepared. No one in the room mentioned the prior experience of Camarioca. The political nature of the events (in an election year) meant that this was not just a logistics exercise but carried major political implications. Expectations and mind sets of actors (military, State Department, Coast Guard, INS, etc.) had to be understood generally by the chair to interpret their input and to garner their cooperation. Recall, for example, that at the time of Mariel the U.S. military were dealing with the effects of the failed desert operation undertaken two weeks earlier to rescue the hostages in Iran.

Palmieri needed to know what existing policies, if any, applied. In the face of a mass movement, a preexisting policy about stopping, containing, working with the sending government, etc. makes a significant difference with respect to efficient implementation of policy and coordination of the many agencies involved.

In the Mariel case, policy had to be forged. Whether to try and stop the boats, with what assets (military, Coast Guard, INS), and so on had not been decided or even discussed beforehand. Such policies were made and changed in an *ad hoc* fashion, including President Carter's response to a reporter's question after a speech of welcoming with open hearts and open arms.

A mass asylum movement is a political crisis and should be coordinated at the level of the White House. Whoever is in charge of day-to-day operations should be from the White House staff or assigned to it and have access to the highest levels of the Executive Branch. Given the likelihood of an asylum crisis, someone should

[2] See: Keely, C.B.; Barrett, R.C. 1992. *The Office of the United States Coordinator of Refugee Affairs: An Experiment in Legislating Crisis Management*. Draft report. Washington, DC: Georgetown University, Center for Immigration Policy and Refugee Assistance.

be designated who actively prepares to fill the role and take the lead, whenever needed. Even if that person hands off to Chief of Staff or some higher official, the line that includes political and logistical considerations ought to be in place.

The first order of priority is to develop the capacity to decide the reaction to the flow. How will the decision be made about whether a flow will be designated as an immigration emergency as provided for in the Immigration Act of 1990? The machinery to gather and funnel information and prepare options is as necessary as logistical preparedness. The Immigration Act of 1990 in its provisions about emergencies is properly silent on this issue. The Executive branch should develop the decision-making procedures.

Preparedness for accepting a flow is not the same as assigned roles to attempt to stop or control a flow. Preparedness to stop or contain potential flows also deserves attention. Contingency plans to stop, deter, deflect, etc., a mass migration should complement other contingency plans for various scenarios that assume asylees will be taken in.

The experience and expertise for being prepared is available. The first requirement is the machinery to decide how to respond to a flow. Then government agencies must be prepared either to accommodate or to try to prevent, control, or divert flows. A review of the decisionmaking in the Mariel incident reveals that a basic flaw was the uncoordinated nature of policy development and decisionmaking during the flow. The initial lack of policy on the fundamental reaction to the flow and the subsequent shifting policies about issues of interdiction, impounding of boats, fines for captains, and other matters makes clear that, even if there was a high level of logistical preparedness, much of the chaos still would have taken place.

Recommendations

The foregoing analysis leads to the following recommendations for discussion and consideration by the Commission.

1. The resource needs of the asylum adjudication system, given current caseloads and future caseloads if asylum procedures are legislatively changed, should be projected. A balance should be struck between catching up with current backlogs and possible reduced applications.

2. Reduced access to asylum procedures by screening out manifestly unfounded

cases, to be successful, requires attention to illegal migration pressures as this avenue to entry is narrowed.

3. The refugee definition currently used to decide acceptability of an asylum claim resulting in admission for permanent residence (application permitted after one year presently) ought not to be broadened to include victims of war and civil unrest.

4. A safe haven policy for victims of war and civil unrest ought to be developed. Safe haven ought to be structured as proposed to encourage attempts by the U.S. government to influence events so that those given safe haven can repatriate. Safe haven should be given in camps for one year and then in the general community with work authorization. Safe haven is envisioned as a temporary remedy for mass migration of persons ineligible for Convention refugee status who nonetheless are fleeing danger due to political events. Safe haven ought to replace TPS. Safe haven ought to be developed and legislated as a new procedure incorporating features of TPS that are useful in safe haven/protection situations. Congress should repeal TPS rather than fiddling with it through amendment.

5. Asylees admitted under current procedures (meeting the criteria of persecution in the refugee definition currently used) and those given safe haven as proposed here should be permitted to apply for permanent resident alien status three years after entry to the United States. The presumption should be that the desired outcome in both cases is repatriation to a safe country of origin, free of political persecution. The three-year period provides a reasonable test of whether political changes are likely and whether a person should be allowed to develop a new life in the United States. The three-year period is a suggestion that attempts to balance reasonably and humanely a test of probable political change with the realities of people's tolerance for adjustment and ambiguity in their lives and their dependent children's lives.

6. Negotiations with countries in the region on burden sharing in cases when safe haven is to be provided ought to begin now to ensure a unified response.

7. Mass, acute migration incidents are political crises by definition. They require White House coordination from the beginning because of the political nature of decisions. Immigration emergencies and attempts to stop or control large influxes ought to have political leadership on policy and operations decisions from the start.

8. The fundamental decision in a mass flow of migrants is whether it will be declared an immigration emergency under the IMMACT of 1990. Contingency planning ought to focus on how information and options will be developed and the steps in that decision process.

9. Contingency planning ought to be developed for what to do in the face of a large-scale flow that is not to be accepted as an immigration emergency.

10. Current planning to accept migrants in an immigration emergency ought to continue, even while supplemented with attention to the decision structure to arrive at the immigration emergency declaration and the roles and procedures for attempts to stop or divert migrations that are decided not to be declared immigration emergencies under the IMMACT 1990 provisions.

The Commission's Research Papers, which present the results of Commission-sponsored research, are intended to elicit comment and provoke discussion. The views presented in these papers are those of the authors and do not necessarily reflect those of the commission.

EXECUTIVE SUMMARY

The greatest threat to habitability may be the degradation of agricultural lands in developing countries where many people depend upon farming for their livelihood. Long periods of over-exploitation due to population growth and poverty inevitably result in land degradation, sometimes irreversibly altering the carrying capacity of the land. This phenomenon, known as desertification, currently affects 3.6 billion hectares, the equivalent of one-quarter of the world's total surface.

The Commission on Immigration Reform [CIR] requested this preliminary study of environmental degradation related to unsustainable land and water use as one of the potential root causes of certain migration from Mexico to the United States. Perhaps as with no other country, migration from Mexico raises critical issues within the Commission's mandate. The 2,000 mile border between Mexico and the United States historically has been porous. In the past thirty years the U.S. has deported more than seventeen million illegal Mexican immigrants. The large wage differential between the two countries and extensive migrant networks act as an enormous "pull" in motivating migration. The poverty and economic disparity in Mexico are strong factors which "push" migrants toward the U.S. Trade relations and the exchange of goods and services across the border heighten the need for stable relations with Mexico. Thus, migration from Mexico will continue to be an important focus for foreign policy development and, specifically, of concern to the Commission.

The findings contained in this report suggest that serious impairment of Mexico's agricultural lands may give rise to migration. There is evidence to suggest that a portion of the 900,000 persons who migrate annually from the arid and semi-arid regions of Mexico do so because of the desertification processes which yearly impair 1,000 square miles of surface area and cause the abandonment of another 400 square miles of farmlands.

As environmental degradation can often be addressed through targeted intervention, this report presents recommendations for future action by the Commission and/or Congress that go beyond reform of traditional migration policies and institutions. It identifies specific issues for further study and policy development as a first step in addressing Mexican migration related to desertification.

Findings on Mexico: Preliminary Case Study

Mexico is the third largest and second most populous country in North America. Two-thirds of the country's poor people are farmers and farm workers. Three-quarters of those most impoverished live in rural areas, many as subsistence farmers.

Desertification in Mexico

Most of Mexico's lands are undergoing some process of land degradation. As a result, approximately 2,250 square kilometers of potentially productive farmlands are taken out of production or abandoned each year. Experts estimate that Mexico's desertification problems are caused largely by the excessive clearing and cultivation of land unsuitable for agriculture, overgrazing, the exploitation of forests and vegetation for fuel, the application of inefficient irrigation practices, mining activities, and urban expansion. Climate conditions, particularly periods of prolonged drought, exacerbate these problems.

The environmental and socioeconomic impacts of desertification have become more widespread as people abandon degraded lands and move onto marginal lands that are even less suitable for agriculture. This "push" into marginal lands is attributable to a number of factors, including government policy, monopolization of higher quality land by large-scale farmers, and a high population growth rate.

Historic Migration from Mexico to the United States

Mexican migration to the United States historically has been rooted in economic trends on both sides of the border. Most of this migration has been illegal, despite such government initiatives as the "Bracero Program," that permitted temporary recruitment and employment of Mexicans in the United States. Legislative efforts, including the Immigration Reform and Control Act of 1986 [IRCA], have been unsuccessful in substantially curbing illegal immigration.

Migration Related to Desertification

Mexicans have fled rural poverty for decades to seek better opportunities in Mexican cities and the United States. The reasons for migration are often complex, but relationships between certain environmental conditions and population movements can be identified.

The quality of farmlands, availability and reliability of water supply, and the management of lands play an important role in contributing to migration from rural areas. Specifically, land degradation and desertification frequently lead to migration when people can no longer subsist on the land. The Mexican government has found that approximately 900,000 people now leave arid and semi-arid areas every year. Our investigation, including analysis of geostatistical information and migration data, confirmed that the inability to make a living from the land due to dry conditions and processes of soil erosion contribute to the decision of rural people to migrate. This is supported by studies of other regions in Mexico and Latin America.

No one has attempted to determine how many of these migrants leave the rural areas of Mexico because of serious impairment of farmlands or other desertification processes. The time constraints and scope of our investigation did not permit us to undertake any real quantification analysis. Further investigation and data development is warranted to provide a more accurate basis for determining the scope of the problem.

Conclusions & Recommendations for Future Action

The findings contained in this report support the following preliminary conclusions.

First, there is evidence to suggest that a portion of the migrating population from Mexico to the United States consists of people who are moving because they cannot farm the lands due to ongoing processes of soil desertification. Second, preventing this migration will require addressing the environmental causes of the problem, largely associated with unsustainable land and water use in Mexico. It is likely that specific policies will be necessary to assure the viability of farming and to revitalize degraded lands. Third, while the development of data on migration associated with environmental problems is too premature to recommend specific foreign policies, our preliminary

analysis reveals that the Commission and Congress will need to look beyond traditional immigration policy to address the root causes of the problem. The precise programs and policies will depend upon the results of further field and analytical study described below.

Issues for Further Investigation of the Environment and Migration Phenomenon

The following recommendations are presented for the Commission's future action to improve understanding of immigration and foreign policies that could be formulated to address the problem.

Investigate the relationship between the environment and migration. Reversing the trends of land degradation in Mexico will be critical in stemming the migration related to unsustainable use of agricultural lands in certain regions. Investigating the links between environment, migration, and population, as well as the interrelationship of climatological factors, will provide more definitive analysis of these trends that can form the basis for appropriate policy development. In this context it would be useful to investigate the lands currently undergoing desertification in rural and semi-arid areas of Mexico that foster significant involuntary migration. This information should be analyzed in conjunction with migration and population data and other geostatistical information.

Investigate the development of immigration and other policies that may be responsive to address ecologically-induced migration. Traditional measures, such as tightening border controls and employer sanctions for hiring illegal immigrants, will be insufficient to prevent the migration related to serious environmental deterioration in Mexico. These traditional policy responses may be more effective if coupled with agricultural land remediation, training, and educational programs. If the objective of U.S. immigration policy is to address root causes of migration, then such an objective will need to incorporate broader policies that involve international cooperation, aid, and technical support measures.

Issues for Evaluation in Developing Broader Policy Responses

The United States could play a catalyzing role in the development of such policies, particularly given its expertise in agricultural management. The Commission and /

or Congress should investigate opportunities for policy development in this area.

Distinguish between environmentally-motivated migrants and other economic migrants to address environmental root causes of migration. Adverse environmental conditions can lead to increased poverty when families can no longer subsist on their lands. They may be forced to join the growing numbers of other "economic" migrants. However, it appears useful to distinguish between these "environmental" migrants and other economic migrants for two reasons. First, understanding that some segment of the international migration population is primarily motivated to move because of their inability to farm could foster the development of environmental programs specifically designed to stem *this cause* of migration. Second, because the motivation for leaving their homelands is different from that of other economic migrants, those forced to leave because farming is unsustainable may consider returning home if remediation programs are offered. The Commission should explore this distinction in its further study of migration and environment issues and in developing policy recommendations.

Investigate how policy responses could provide an opportunity for some migrants to return home. The preliminary findings of our investigation suggest that migrants forced to leave because farming is unsustainable may consider returning home if they can successfully farm the land. Further study is needed to determine whether these findings represent the attitudes of a broader base of rural migrants in the United States. If so, the Commission and/or Congress should determine the potential for developing policies to promote the return of rural migrants to participate in agricultural training and development programs in Mexico.

Investigate the opportunity for establishing joint U.S.-Mexico programs to address the migration related to environmental problems. The creation or modification of certain policies in Mexico likely will be needed to redress the growing environmental problems related to harvesting of forests and vegetation. Financial assistance and transfer of technical expertise could play a key role in promoting the implementation of these policies in many parts of Mexico. The Commission and/or Congress should explore the opportunity to develop cooperative programs with Mexico to create, finance, and implement environmental mitigation and prevention programs.

Potential Short- and Long-Term Opportunities for Development of Environmental Solutions

This report identifies specific measures that warrant further consideration in the formulation of environmental programs and policies. These are based upon preliminary investigation of some desertification problems in Mexico and our experience in developing recommended programs to address agricultural management problems in the western United States. We have identified the need to develop such policy goals as: reducing crop cultivation on marginalized lands; instituting controlled grazing practices and promoting alternative sustainable uses of the lands affected; reducing water-intensive crop cultivation in certain areas; substituting drought resistant crops, where appropriate; and implementing efficient agricultural water management practices.

The primary difficulties in translating these objectives into actual practices will be (1) securing the resources and expertise necessary to assist farmers in modifying their behavior and, (2) obtaining the cooperation of the rural workers who traditionally have followed particular cultivation, grazing, harvesting, and irrigation practices.

One way to achieve the necessary participation may be to carry out model programs or pilot projects to test the recommended changes in land management. Rural participants closely involved in the development and application of solutions will ensure that programs are more practical and influential in fostering change by both the immediate participants and outside observers. If there is sufficient financing to reduce the risks, rural communities or *ejidos* may participate voluntarily in these projects.

INTRODUCTION

The scope of the mandate of the Commission on Immigration Reform [CIR], as created by the Immigration Act of 1990, includes examination of the impact of immigration on the foreign policy and national security interests of the United States. Perhaps as with no other country, immigration from Mexico raises critical issues within this mandate. The 2,000-mile border between Mexico and the United States historically has been porous. In the past thirty years, the U.S. has deported more than seventeen million illegal Mexican immigrants. The large wage differential between the two countries and extensive migrant networks act as an enormous "pull" in motivating migration. The poverty and economic disparity in Mexico are strong factors which "push" migrants toward the U.S. Trade relations and the exchange of goods and services across the border heighten the need for stable relations with Mexico. Thus, immigration from Mexico will continue to be an important focus for foreign policy development.

CIR requested this preliminarily study of one of the potential root causes or push factors of migration from Mexico: environmental degradation related to unsustainable land and water use in rural areas. Though this relationship has been little studied, our investigation revealed that there may be a strong link between serious impairment of agricultural lands or "desertification" and increased migration to the U.S. There is evidence to suggest that a portion of the 900,000 persons who migrate annually from the arid and semi-arid regions of Mexico may do so because of the desertification processes that yearly impair 1,000 square miles of surface area and cause the abandonment of another 400 square miles of farmlands.

Perhaps unlike other economic root causes of migration, environmental degradation often can be prevented or remediated with targeted intervention. We have a solid understanding of the management techniques required to address many agricultural land and irrigation problems, but often there is a lack of education, training, and financial resources to undertake the necessary reforms. Such reforms could yield both short- and long-term benefits to Mexico and the United States in addressing the problem.

Our findings suggest that the Commission's further investigation of the environment and migration phenomenon is warranted to increase understanding of the official policies that could be formulated in response. Congress will need to look beyond traditional immigration policies to address the environmental root

causes of migration. In this paper, we present the findings of our preliminary study and recommendations for further action by the Commission and Congress.

BACKGROUND

There are many areas in the world where unsustainable land use practices inevitably result in soil deterioration, sometimes irreversibly altering the carrying capacity of the land. This process of desertification can have profound social and economic impacts, including migration.

The United Nations Conference on Environment and Development [UNCED] concluded that desertification affects 3.6 billion hectares of rain-fed croplands, rangelands, and irrigated lands, the equivalent of one-quarter of the world's total land surface, and 70 percent of all drylands (UNCED 1992a:47). Even more critically, this phenomenon affects one-sixth of the World's population (UNCED 1992a:47). The United Nations Population Fund recently concluded that more than 135 million people may be at risk of being displaced by severe desertification (UNPF 1991:32).[1]

While the causes of environmentally-induced population movements are numerous, the greatest threat to habitability may be the degradation of agricultural lands in countries where most people depend upon farming for their livelihood. Population growth and poverty place additional pressure on scarce land resources, exacerbating desertification (UNPF 1991:32).[1] If growth rates are not reversed, the current, alarming pace of environmental degradation will accelerate: each year, eleven million hectares of tropical rainforests are cut, twenty-six billion tons of topsoil are eroded, and six million hectares of arable land are desertified (UNCED 1992c:para 47, 48, 69, 70, 79, 82, 83, 101). These factors ultimately force people to abandon an agricultural subsistence and relocate to nearby already overpopulated urban centers or to migrate to neighboring states.

We have investigated this issue in various countries and regions of the world. (Maloney 1990/91a, 1990/91b; Sanders 1990/91a, 1990/91b; Tamondong-Helin & Helin 1990/91; Catanese 1990/91). Development in parts of North America and the Caribbean Basin countries has led to substantial rural outmigration over the last

[1]The current trends in population growth exacerbate this threat. The expected increase in the world's population by nearly one billion people will occur in poverty-stricken areas, increasing pressure on lands that already have been marginalized (UNCED 1991; El Hinnawi 1985).

three decades, some to the United States and most to urban centers within the affected countries (Commission for the Study of International Migration and Cooperative Economic Development 1990:101). Little has been documented, however, on the relationship between environmental degradation and migration in this region.[2]

Mexico is one of many countries affected by these problems. Mexico's climate is predominantly arid or semi-arid. Much of its surface area is affected by desertification, caused by a combination of climatological factors and unsustainable land-use practices. Mexico has also been the source of large-scale, cross-border migration for several decades. The findings contained in this report indicate that the increasing impairment of Mexico's agricultural lands is a potentially significant cause of migration to the United States that warrants further study. Preliminary evidence of this relationship suggests further avenues of research, education, and targeted intervention will be necessary to remediate existing or prevent future problems.

Our findings and recommendations presented below are based upon work that we completed for the United Nations Secretariat for the Intergovernmental Negotiating Committee for a Convention to Combat Desertification and Drought [INC-D]. Our analysis was expanded to focus on issues critical to U.S. immigration policy development.

FINDINGS ON MEXICO: PRELIMINARY CASE STUDY

Introduction and Methodology

In investigating the desertification and migration problems in Mexico, we undertook an extensive literature review, conducted sample interviews with migrants living in Northern California[3] and with people in several rural towns and villages in Central Mexico, and discussed the is-

[2]There is an abundance of literature on deforestation and land degradation, with only incidental reference to the resultant migration. While migration experts and academics have undertaken much research on migration patterns in this region, they have not looked deeply into how environmental problems may contribute to these population movements.

[3]California is the primary destination of most undocumented migrants from Mexico. "Approximately two-thirds of undocumented Mexico State migrants in the United States are to be found in California . . . " (Bustamante 1992:10).

sues with migration and environment experts. As we had such a short time to conduct our investigation, the findings presented below can be viewed only as preliminary.

The maps presented in this report were developed for the Natural Heritage Institute in connection with this project and as part of a cooperative program between COLEF [El Colegio de la Frontera Norte in Tijuana directed by Dr. Jorge Bustamante] and ORSTOM [The French Institute of Scientific Research for Cooperative Development], a study financed in part by CONACYT. This is part of a Geographic and Statistical Information System [SIGEF] concerning the North Frontier/Border created by D. Delaunay and J. Santibanez. The maps use the Savane and Rapido parameters developed at the Institute by Marc Souris and Michel Lepage. The census information is taken from CODICE90, CD-ROM edited by INEGI. The information provided on migration was obtained from surveys conducted by Dr. Bustamante, R. Corona, and J. Santibanez of COLEF. The climatic characterization is derived from the National Atlas of Mexico of UNAM, from the National Atlas of the Physical Environment of Mexico and relevant letters published by ENEGI. The authors of the geostatistical information presented are Daniel Delaunay (Demographer), Alain Winckell (Geographer) and Michel Lepage (Data Analyst) of ORSTOM.

Demographic and Geographic Profile

Mexico is the third largest and second most populous country in North America. Its current population of 88 million people has quadrupled since 1940, (Commission for the Study of International Migration and Cooperative Economic Deveopment 1990:11), and is growing by 1.5 million people annually (Commission for the Study of Migration and Cooperative Economic Deveopment 1990:12). Mexico City, the capital of Mexico, is the most populated city in the world, with an expected 25 million people by the year 2000 (UNPF 1991:60).

Mexico's territory extends over 1,958,201 square kilometres, bordering the United States to the north, the Gulf of Mexico and the Caribbean Sea to the east, Belize and Guatemala to the southeast, and the Gulf of California and the Pacific Ocean to the west. Most of the country is highland or mountainous. Approximately 20 percent is forested. Most of the Yucatán Peninsula and the Isthmus of Tehuantepec in the southeast is lowland. There are lowlying strips of land along the Gulf

of Mexico, the Pacific Ocean, and the Gulf of California. The heart of Mexico is the great Mexican Plateau, which is interrupted by mountain ranges and segmented by deep rifts.

The country is divided into thirty-one states and a federal district that includes the capital, Mexico City [**Map 1** p.19]. The government is organized as a federal republic, with the powers of chief executive and head of state vested in a popularly-elected president.

Approximately 55 percent of Mexico's population are Mestizo, 29 percent Amerindian, and 10 percent European, with Spanish the primary language and Roman Catholicism the most-practiced religion. Two-thirds of the country's poor people are farmers and farm workers. Three quarters of those most impoverished live in rural areas (Martin 1993:99). Many in agriculture are *subsistence* farmers who commonly grow corn and beans for their families and depend on low and variable rainfall for the success of their crops (Martin 1993:100).

A unique feature of Mexican agricultural management is its communal land or "*ejido*" system. *Ejidos* are communal farms that were created after the Mexican revolution when the government redistributed land from large landowners to the landless peasants for whom the revolution was fought. *Ejido* members obtain land as a group from the government, but usually farm the land individually. *Ejidos* control about 70 percent of Mexico's croplands and half of its irrigated lands (Martin 1993:101). National policy now allows individual *ejido* members to sell or rent their land.

Desertification in Mexico

There has been much debate about the meaning of the term "desertification." The best explanation of it as *both* a physical state of land degradation and as a process of deterioration may be the following:

> Desertification, revealed by drought, is caused by human activities in which the carrying capacity of the land is exceeded; it proceeds by exacerbated natural or man-induced mechanisms, and is made manifest by intricate steps of vegetation and soil deterioration which result, in human terms, in an irreversible decrease or destruction of the biological potential of the land and its ability to support populations. (Mainguet 1991:4)

The term is technically defined by the recently adopted United Nations Convention to Combat Desertification as, "land degradation in arid, semi-arid and dry sub-humid areas resulting from various factors, including climatic variations and human activities." (UNGA 1993b)

Most of Mexico's lands are undergoing some process of land degradation. The government of Mexico has concluded that 97 percent of its territory is affected to some degree, and that 60 percent of its territory is extremely or severely degraded.[4] This data is not surprising in light of findings by experts in 1978 that approximately 150 million hectares of land had problems of desertification, representing 80 percent of Mexico's territory (Medellin-Leal 1978:107). These experts estimated that desertification would continue to advance rapidly in Mexico, degrading between 100,000 and 200,000 hectares of land per year. The Mexican government's current findings suggest that this prediction was correct.

As a result of this land degradation, it is now estimated that 1,000 square miles or 2,250 square kilometers of potentially productive farmlands are taken out of production or abandoned each year (Myers 1993:140; UNPF 1991:99). These figures demonstrate the gravity of the desertification problem in Mexico and underlie the need for immediate preventative and remedial measures.

Aridity in Mexico

Much of Mexico is comprised of arid and semi-arid zones, making the lands vulnerable to the processes of desertification, as discussed below. These lands constitute more than 50 percent, and perhaps as much as 80 percent, of Mexico's territory (Myers 1993:139; Ballin-Cortes 1990a:3). [See **Map 2**]. The government of Mexico estimates that they comprise 52.5 percent of Mexico's total land area (Comision Nacional de las Zonas Aridas 1993:sum 1.1).

Approximately eight million hectares of land, constituting approximately 45 percent of all agricultural land, is farmed or used for grazing in the arid and semi-

[4]We were unable to obtain a complete copy of the *Plan de Accion Para Combatir la Desertification en Mexico* before this paper was submitted to the Commission. Where possible, we refer to the portions of the final plan that we obtained (Comision Nacional de las Zonas Aridas 1994). Where we were missing portion of the final plan, we have in a few instances, relied on information contained in a prior version of the plan prepared in October 1993 (Comision Nacional de las Zonas Aridas 1993).

arid regions of Mexico. Of this land, only about 25 percent is irrigated. Seasonal agriculture, or rainfed farmland, in these regions has the highest rate of crop loss in the country. Frost and drought are the principal causes (Comision Nacional de las Zonas Aridas 1993:sum 1.3).

The desert, arid, semi-arid, dry subhumid, and humid regions of Mexico are shown on **Map 2** [p.20], "Index of Aridity." Of Mexico's territory, 23.6 percent is desert, 11.2 percent is arid, 9.9 percent is semi-arid and 25.7 percent is dry sub-humid [**Map 2**]. This indicates that approximately 70 percent of Mexico's lands may be vulnerable to desertification. Levels of precipitation and evaporation in Mexico tend to support this estimate: **Maps 3**, **4**, and **5** [pp.21-23] identify precipitation and evaporation levels in various regions in Mexico and the number of dry months per year experienced in these regions. We determined "aridity" for the purpose of these charts as the ratio of average annual rainfall and average annual evaporation. In developing this working definition of aridity, we incorporated the definition now contained in the U.N. Convention to Combat Desertification (UNCCD 1994).[5]

Processes of Desertification and Regions Most Affected

There are a number of natural mechanisms or phenomena that contribute to the processes of desertification of vulnerable lands (those lands being utilized beyond their carrying capacity). The most significant of these in Mexico are wind and water erosion of soils, affecting between 60 percent and 85 percent of Mexico's territory (Comision Nacional de las Zonas Aridas 1993:Ch 2, sect 2.3.2, 2.3.3). Experts estimate that at least 70 percent of Mexico's agricultural lands are affected by soil erosion of some type (Myers 1993:140; UNPF 1991:98).

Other significant types of land degradation that form part of the desertification process include salinization, sodification, physical degradation, biological degradation, and chemical degradation. The Mexi-

[5]Article 1 of the text defines arid, semi-arid, and dry sub-humid areas as areas "in which the ratio of average annual precipitation to potential evapotranspiration falls within the range from 0.05 to 0.65" (UNCCD 1994). While this definition does not provide clear guidance, it does suggest the importance of examining temperatures, precipitation and evaporation or potential evapotranspiration in determining the level of aridity in a particular region.

can government estimates that these processes affect 20 percent, 15 percent, 20 percent, 80 percent and 15 percent of Mexico's territory respectively (Comision Nacional de las Zonas Aridas 1993:Ch 2, sect 2.3.2-2.3.7).

Salinization and sodification of soils are of particular interest to some because they are caused primarily by irrigation that is otherwise considered to be a beneficial practice. The problems generally stem from poor draining of irrigated lands and the application of poor quality water. An estimated one-fifth of Mexico's cropland is irrigated (Liverman & O'Brien 1991:351), and 10 percent of these lands are now highly salinized (Myers 1993:140; Comision Nacional de las Zonas Aridas 1993:Ch 2, sect 2.3.4). Our investigations suggest that this problem is particularly notable in such arid states as Sonora where irrigation is relied upon for the production of crops in the absence of significant rainfall (Arguelles 1993).[6]

The government of Mexico has investigated the extent of these processes of land degradation in the states of Mexico (Comision Nacional de las Zonas Aridas 1993:Ch 2). According to this investigation, the Mexican states with the greatest rates of land degradation are:

Water erosion. Aguascalientes, Guanajuato, Coahuila, Michoacan, Zacatecas, Jalisco, Nuevo Leon, and San Luis Potosi, with more than 45 percent of the surface severely affected;

Wind Erosion. San Luis Potosi, Morelos, Hidalgo, Nuevo Leon, Baja California, Queretaro, and Zacatecas, with more than 80 percent of their surface affected;

Salinization. Tamaulipas, Sonora, Baja California, Chihuahua, Coa-huila, and Colima, with more than 2 percent of their surface affected;

Sodification. Campeche, Sonora, Quintana Roo, Morelos, Yucatan, Tabasco, and Mexico, with 13-40 percent of their surface affected;

Physical Degradation. Hidalgo and Veracruz, with 40-90 percent of their surface affected;

Biological Degradation. Colima, Morelos, Tabasco, Chiapas, Veracruz,

[6]Mr. Arguelles is an agrarian lawyer with substantial experience and knowledge of conditions in the Sonora area.

Jalisco, Michoacan, Nayarit, Yucatan, and Sinaloa, with more than 90 percent of their surface affected;

Chemical Degradation. Tabasco, Campeche, Veracruz, Nayarit, and Oaxaca, with 20-67 percent of their surface affected;

States that are experiencing nearly all of these forms of degradation are: Chihuahua, Coahuila, Colima, Jalisco, Mexico, Sinaloa, and Sonora (Comision Nacional de las Zonas Aridas 1993:Ch 2, sect 2.3.2-2.3.7). Our investigation indicates that there may also be considerable land degradation in Puebla and Guerrero.

Given the extent of arid and semi-arid areas in Mexico, it is likely that a significant portion of the lands in Mexico are vulnerable to, or are presently undergoing, desertification at some level. We were unable to obtain precise information on the areas in which the soil or vegetative deterioration has resulted in an irreversible decrease or destruction of the biological potential of the land and its ability to support people. Further investigation will be needed.

Experts have found that serious desertification usually exists along the borders of deserts, such as Northern Mexico and in the areas of transition between semi-arid and subhumid or tropical zones (Ballin-Cortes 1990b:158) [See **Maps 2** and **6** pp.21,24]. Our observations of the borders of the Chihuahuense Desert in the San Luis Potosi area were consistent with this finding.

Unsustainable Land-Use Practices Causing Desertification

Human activities are generally considered to be the determining factor in all stages of desertification (Mainguet 1991:5). It is estimated that 87 percent of desertification problems are caused by unsustainable land use, with the remaining 13 percent attributable to climate conditions (Ballin-Cortes 1990a:3). The overexploitation of lands can make them vulnerable to the processes of desertification. Lands in arid or semi-arid areas that have been stripped of their vegetative cover are perilously susceptible to erosion from harsh winds or rains. This degradation may irreversibly alter the ability of the soils to sustain crops that may be replanted or vegetation for grazing.

The types of land use practices that can lead to desertification include:

1. Clearing and cultivating lands unsuitable for agriculture or cultivating crops in a manner that overburdens the land without taking adequate precautions against erosion;

2. Overgrazing lands, including placing too many animals on small parcels of land and failing to rotate the lands grazed;

3. Exploiting forests and other vegetation for fuel, consumption, and sale;

4. Adopting poor water management and irrigation practices;

5. Urban expansion, mining, and public works. (Medellin-Leal 1978:63-71; Comision Nacional de las Zonas Aridas 1993:Ch 2, Sect 2.2.1-2.2.4; Ballin-Cortes & Vasquez Rocillo 1993).

Of these activities, the first two may cause the most widespread degradation in Mexico (Ballin-Cortes & Vasquez Rocillo 1993).

Our field investigation confirmed that poor cultivation practices and overgrazing are serious problems. We toured parts of San Luis Potosi in the Desert of Chihuahua reputed to be typical of arid and semi-arid areas with desertification problems. There we observed, and confirmed through interviews, that the majority of the rural population tries to subsist by growing corn and beans, despite the fact that the natural soil base is only marginally productive, even when rainfall is adequate, and is generally exhausted by these crops in a short time (Ballin-Cortes & Vasquez Rocillo 1993; Natural Heritage Institute 1993). When rainfall is inadequate, as is frequently the case, these people find themselves in a desperate situation. We also observed that a substantial portion of the rural population practices grazing as a supplement or alternative to cultivation.

The results of these practices were visible in the land conditions we encountered. Vegetation was extremely sparse in the areas surrounding each village and many dusty fields of little apparent productive value were left exposed to wind and water erosion. The poverty of the people living in these conditions was notable. At the time of our visit, hundreds of women and children from the villages lined the central highway begging for candy, money, or gifts for the upcoming Christmas season.

The environmental and socioeconomic impacts of desertification have grown as

people abandoned the degraded lands and moved onto more marginal lands, less suitable for agriculture (Ballin-Cortes & Vasquez Rocillo 1993). The push into marginal lands is attributable to a number of factors, including official policies. First, as land is exhausted due to unsustainable cultivation and grazing, rural inhabitants seek official authorization to clear more land, which they use and manage in the same way, thereby continuing the pattern of degradation and abandonment of lands. Second, the government has commonly granted permits for this type of clearing in an attempt to placate poor rural farmers and obtain political support (Ballin-Cortes & Vasquez Rocillo 1993). The government generally has promoted the expansion of agriculture and grazing into marginal lands in the wake of the Mexican revolution as part of the effort to provide peasants with promised land. The government has sometimes attempted to satisfy peasant demands by providing them marginal land not previously cultivated, rather than taking land from large landholders.

Third, large-scale farmers have consistently purchased the more marginalized lands of the smaller-scale farmers, causing them to seek new land in even more marginal areas (Myers 1993:141). Many believe that this trend will intensify in the wake of new land reform policies which allow *ejido* members to sell or rent their land (Villarejo 1993; Ballin-Cortes & Vasquez Rocillo 1993). Fourth, high population growth rates increase thedemand for land in Mexico causing both a *push* into marginal lands and an increase in the level of many activities contributing to desertification (Liverman 1992:64; Myers 1993:141-42; Comision Nacional de las Zonas Aridas 1993:Ch 2, sect 2.1). The government of Mexico has noted that the advance of desertification is particularly rapid in central Mexico where the population density is greatest and the pressures on the land are most severe (Comision Nacional de las Zonas Aridas 1993:Intro). **Map 6** [p.24] illustrates those areas where rural density is the greatest in Mexico and correlates this with data on aridity. As the map indicates, the central plateau is a semi-arid zone with high population density. As discussed below, **Maps 7** and **8** [pp.25,26] also identify significant migration from this region.

Finally, for many years, the National Bank in Mexico has financed the cultivation of such crops as corn and beans, regardless of whether those crops were sustainable by the land under cultivation. This fiscal policy apparently has encouraged rural workers to continue unsus-tainable agricultural practices and created financial difficulties for the National Bank because the lack of productivity resulted in reduced profits and loans were frequently unpaid (Ballin-Cortes & Vasquez Rocillo 1993).

Climate, Drought and Desertification

Periodic droughts and generally dry conditions in the arid, semi-arid, and dry subhumid areas of Mexico have undoubtedly contributed to the advance of desertification. Only about 12 percent of the nation's water is on the central plateau where 60 percent of the population and 51 percent of the cropland are located (Liverman 1992:45). However, some believe that climatic events have played only a small role in this process, noting that to date temperatures have not changed notably and that the low rainfall experienced in dry years in the arid and semi-arid regions has usually been within the expected range of precipitation (Ballin-Cortes & Vasquez Rocillo 1993).

Where climate change has occurred, some experts suggest that it has been caused or exacerbated by human activity. One study examining the differences between Arizona and Sonora along the United States/Mexico border found that variations in temperature could be explained by differences in vegetation and soil moisture on the two sides of the border (Balling 1988:106-07; Bryant, et al. 1990:260-61). On the Mexican side of the border, vegetation and soil moisture were depleted due to heavy overgrazing, resulting in temperatures that were two to four degrees centigrade warmer than on the Arizona side where grazing was practiced in a controlled, sustainable manner (Balling 1988:106-07; Bryant, et al. 1990:260-61). The authors of the study also believe that the conditions on the Mexican side of the border may actually decrease the amount of rainfall, though this postulation has yet to be verified (Balling 1993). Certainly, the degraded condition of land on the Mexican side of the border exacerbates the erosion caused by rainfall.

In addition, the impacts of climate change on the environment often depend more on the characteristics of the region and people affected than on the nature of the climate change itself (Liverman 1992:44, 57). Thus, for example, one study found that the lands vulnerable to drought in two different regions of Mexico corresponded much more closely with mismanagement of *ejido* lands, lack of irrigation, lack of high yielding seed varieties, and lack of fertilizer than with physical climate conditions (Liverman 1992:60).[7]

[7]The correlation with *ejido* land management appeared to be based on the facts that more marginal land was given to *ejidos* in land reform efforts and that *ejidos* are socially more vulnerable because they have less access to irrigation, credit, improved seeds, and other resources (Liverman 1992:61).

Nevertheless, climate clearly plays a role in the processes of desertification and there is widespread concern that the decline in sustainability of Mexico's lands for agriculture will become even more alarming if predicted global warming occurs. The effects of global warming in Mexico, under any model, will create warmer and drier conditions (Liverman & O'Brien 1991:363). Such conditions could increase significantly the severity and effects of drought, exacerbate the processes of desertification, and devastate the majority of Mexican croplands and farmers relying on low and variable rainfall (Liverman & O'Brien 1991:364; Liverman 1992:45, 65; Myers 1993:140).

Migration Related to Desertification

Mexicans have been fleeing rural poverty for decades to seek better opportunities in Mexican cities and the United States (Martin 1993:99). Work shortages are worst in the rural areas of Mexico, where unemployment and underemployment affect two out of three of all potential workers (Myers 1993:142). Such unemployment and underemployment generally create strong currents of migration (Martin 1993:52-53).

It is difficult to determine why migration occurs in any time period or from any particular region. The reasons for migration are often complex. Population movements from rural Mexico depend upon a number of factors, including the extent of familial or other networks already established in the U.S. and potential earnings (Massey, Goldring & Durand 1993; Durand & Massey 1992).[8] Determining, with any precision, the central reason for migration in any particular case or community requires in-depth study and extensive survey or interview of migrants and community members.

[8]"The changing selectivity of migration results from the growth and elaboration of migrant networks, which are composed of ties of kinship, friendship, and paisanaje (shared community origin) between migrants and nonmigrants located in the United States and Mexico. . . . Once the number of network connections in an origin area reaches a critical threshold, migration becomes self perpetuating in creating the social structure needed to sustain it. Every new migrant reduces the costs of subsequent migration for a set of friends and relatives" (Durand & Massey 1992:17).

Age, availability of jobs and wages also play a central role (e.g., Ritchey 1976; see also Azipe 1981).

Notwithstanding the complexity in attempting to determine the *primary* factor motivating migration in a particular circumstance (which may require disaggregating a multiplicity of reasons), we can identify relationships between certain environmental phenomenon and population movements.[9] These are discussed below, after a brief summary of historic migration from Mexico to the United States, and should provide context for the discussion that follows.

Historic Migration from Mexico to the United States

The United States, particularly California, is the primary destination of migrants leaving Mexico (Bustamante 1992:10). The border between Mexico and the United States extends 2,000 miles. Unauthorized migrants cross it daily. Since 1964, seventeen million illegal Mexican migrants have been apprehended and deported (Durand & Massey 1992:6).[10]

Mexican migration to the United States historically has been rooted in economic trends on both sides of the border. Between 1849 and 1900, more than 100,000 Mexican immigrants migrated to the United States (Corwin 1978:31 citing 12th U.S. census), finding employment throughout the American Southwest as ranch hands, agricultural workers, and track workers for the railroads (Corwin 1978:29). Between 1910 and 1935, as a result of the economic turmoil following the Mexican revolution and the fact that the average wage for an agricultural worker in the United States was two to ten times that of the Mexican agricultural worker (Corwin 1978:53), approximately 1.5 million Mexican migrants came to the United States (Commission on Agricultural Workers 1992:42). During this period, large-scale farms, railroads, and mines in the United States soon became dependent on the Mexican workers, who were willing to accept temporary employment for low wages (Martin 1993:57). Out of their desire for a cheap seasonal labor supply, these commercial interests lobbied fiercely to obtain exemptions for Mexican

[9]This has been determined through several other country-specific investigations, some of which are summarized in this report.

[10]For decades there has been significant illegal migration form Mexico to the United States. From 1942-1964, some five million Mexicans were apprehended and deported (Durand & Massey 1992). It is widely believed that the U.S. Bracero programs, granting legal status to thousands of Mexicans and Latin Americans to work the burgeoning U.S. agricultural fields (particularly during World War II), encouraged illegal migration to the U.S.

migrant workers from the then restrictive immigration laws, and were to a great extent successful up until the onset of the Great Depression (Zabin, et al. 1993:19).

After the Crash of 1929, however, as a result of the huge influx of migrant American workers into the farm labor market in California, the Department of State began instituting restrictionist policies that ordered more stringent enforcement of existing immigration laws from which Mexican laborers had previously been exempt (Cardenas 1975:74). From 1929 to 1933, between 300,000 and 450,000 Mexicans were deported or voluntarily departed from the United States (Durand & Massey 1992:5). As the Depression subsided and the United States began preparing for World War II, agricultural employers successfully lobbied for renewed importation of Mexican labor (Martin 1993:60). As a result, the Bracero Program was established in 1942 pursuant to a bilateral agreement between the United States and Mexico (Cardenas 1975:75).

The Bracero Program permitted large-scale recruitment and temporary employment of Mexicans, though it did not provide a mechanism for legal immigration (Cardenas 1975:75). The Bracero Program, as initially passed, lapsed at the end of 1947. During its first five years the program was small, admitting only 62,000 workers at its peak in 1944 (Martin 1993:61). The Program continued, however, under the Ninth Proviso of the Immigration act of 1917, which exempted temporary laborers from alien exclusion laws (Commission on Agricultural Workers 1992:28). During this phase of the Bracero Program, employers directly recruited and contracted with Mexican laborers without government supervision (Cardenas 1975:77). The most common method of recruiting Mexican laborers at this time consisted of finding Mexicans who were illegally in the United States, temporarily deporting them to the border, and then recruiting them as braceros (Cardenas 1975:78). After the onset of the Korean war, Congress enacted the Third phase of the Bracero Program as Public Law 78 (Mexican Farm Labor Program) in 1951. To protect domestic labor, however, Public Law 78 required that, before Mexican laborers could be recruited, the Secretary of Labor had to determine that: no domestic laborers were available to do the work; the employment of Mexican laborers would not adversely affect the wages of similarly situated domestic workers; and reasonable efforts had been made to attract domestic workers to the employment in question (Cardenas 1975:78). Public Law 78 was extended six times by Congressional amendments until the end of 1964 (Cardenas 1975:79).

During the entire span of the program from 1942 to 1964, approximately 4.6 million braceros were admitted into the United States (Durand & Massey 1992:6). At its peak between 1956-1959, more than 400,000 braceros were admitted each year (Martin 1993:63).

Despite the Bracero Program, however, illegal immigration continued to be important source of Mexican labor in the United States (Cardenas 1975:79). The number of apprehensions made by the INS (i.e., 4.87 million) was greater than the total number of workers admitted pursuant to the Program (Martin 199:63). Some authors have argued that the Bracero Program actually stimulated illegal immigration by creating the expectation "that the fastest way to upward mobility was to go north," (Commission on Agricultural Workers 1992:19) and by establishing permanent migratory networks. In contrast to the 4.6 million Mexicans admitted under the Bracero Program and the 1.5 to 5 million workers who immigrated illegally, only 545,000 Mexicans legally immigrated to the United States between 1942 and 1964 (Martin 1993:63).

Illegal immigration grew rapidly after the Bracero Program expired. The number of illegal aliens apprehended climbed steadily from 86 thousand in 1964 to more than 1 million by 1977 (Congressional Research Service 1980:37). Estimates of the total number of illegal aliens in the United States from the mid-sixties to the present vary widely, but there appears to be consensus that there was a steady increase until the enactment of the Immigration Reform and Control Act of 1986 [IRCA] (Commission on Agricultural Workers 1992:4; Durand & Massey 1992:7).[11] IRCA struck a compromise between agricultural interests, who wanted a temporary worker program that would provide an adequate supply of seasonal laborers, and labor interests, who argued that importing more labor was unnecessary and would depress wages and displace domestic labor (Commission on Agricultural Workers 1992:6). IRCA mandated employer sanctions as the "principal tool for reducing illegal immigration to the United States," and provided for legalization of more than 1 million illegal agricultural workers under the Special Agricultural Worker Program (Commission

[11]Durand and Massey suggest that perhaps the most accurate estimate of the number of illegal immigrants in the United States at the time of IRCA is derived from the number of people who applied for general amnesty and legalization through the SAW provisions (2.3 million) plus 25 percent.

on Agricultural Workers 1992:5). Although IRCA was successful in legalizing 2.3 million illegal immigrants, it did not substantially curb illegal immigration (Durand & Massey 1992:10), and, therefore, failed to stabilize the agricultural labor market (Commission on Agricultural Workers 1992:132). The Commission on Agricultural Workers, which was mandated under IRCA to assess it, concluded that, as long as employers continued to hire unauthorized workers and Mexicans lacked economic opportunities at home, illegal migration would continue (Commission on Agricultural Workers 1992:132-33).

Migration from Mexico to the United States Related to Environmental Degradation

The results of our preliminary study of Mexico suggest that the quality of farmlands, availability and reliability of water supply, and the management (or mismanagement) of lands play an important role in contributing to migration from rural areas. The inability to farm because of land degradation or desertification can result in rural unemployment and general poverty and can lead to migration. In 1978, experts examining the desertification problem in Mexico concluded that approximately 600,000 people abandoned the countryside every year as a direct result of their inability to subsist on the land (Medellin-Leal 1978:59, 71). These experts attributed the inability to survive in the countryside in large part to the process of desertification that continually reduced the workable surface areas of the land and impoverished many Mexicans (Medellin-Leal 1978:59, 65, 71). They also noted that arid and semi-arid areas were the principal sources of these rural migrants (Medellin-Leal 1978:73).

In discussing the historical role that land quality and distribution has played in decisions to migrate from rural Mexico, two experts concluded:

> Although the common wisdom is that adopting cash crops and capital intensive production methods led to greater out-migration via displacement of rural workers, comparative studies suggest that the process was more complex. Displacement did occur in communities with poor quality land and in places where land was unequally distributed, but in communities

> where land was of high quality and more evenly distributed among families, the advent of commercialized farming increased rural incomes, lowered risks to farm households, and thereby reduced pressures for migration to the United States. (Durand & Massey 1992:35)

Based on more recent investigations, the Mexican government observed that there is still a strong tendency for people to migrate from arid and semi-arid areas, which contain 20 million inhabitants with scarce possibilities for work (Comision Nacional de las Zonas Aridas 1993:Ch 2,sect 2.1). *The government found that approximately 900,000 people now leave these areas every year* (Comision Nacional de las Zonas Aridas 1993:Ch 2, sect 2.1, 2.5).[12] As suggested in earlier studies, a significant portion of the migration from arid and semi-arid rural areas likely is attributable, at least in part, to the desertification that eliminates approximately 1,000 square miles of land and causes the abandonment of at least 400 square miles of farmland every year (Medellin-Leal 1978:59; see also Myers 1993:140; UNPF 1991:98-99). This explains why some experts have concluded that recent upsurges in migration from Mexico's rural areas are caused by land degradation that, together with rising population levels and the push of small farmers onto marginal lands, has caused an "agricultural squeeze" (Myers 1993P:141; UNPF 1991:99; Bilsborrow & DeLargy 1991:128-29).[13]

Our investigation of the San Luis Potosi area confirmed a strong relationship between the inability to make a living from the land due to dry conditions or land degradation and the decision to migrate, at least temporarily (Natural Heritage Insitute 1993; Ballin-Cortes & Vasquez Rocillo 1993). The people we spoke with stated that when their corn and bean crops were inadequate and grazing was poor, as frequently occurred, one or two family members would be forced to migrate in search of work to supplement the family income. These people generally attributed the failure of crops and grazing to lack of rainfall and the absence of irrigation systems.

Some experts assert that these deficiencies more properly are attributed to the inability of the land to sustain corn and bean crops, the poor management of graz-

[12]In the final version of the National Plan, now being issued, the government notes that the largest part of emigration is from municipalities that are predominantly rural in character.
[13] Population growth is greater in rural than urban areas (Mendez y Mercado 1985:14).

ing, and general land degradation resulting from these practices (Ballin-Cortes & Vasquez Rocillo 1993). Agricultural economist David Runsten finds many problems with existing agricultural practices in Mexico. Soilborne diseases are common and irrigation practices are poorly applied (Runsten 1994). While the government has begun to take steps to address the problem, in some cases providing compensation to landowners to plant trees on their lands, there apparently has been little research, education, or training in Mexico on alternate or supplemental agricultural techniques to remedy this problem (Runsten 1994). Runsten believes that many of the people living on marginal lands in Mexico will continue to migrate as the lands become unsuitable for farming or grazing.

These observations have been confirmed by other studies of Mexico and Latin America (Bilsborrow & DeLargy 1991:128-9). For example, Edward Taylor has indicated that, in his investigation of Michoacan, Mexico, he found a strong link between environmental degradation and migration. He indicated that:

> There is a direct negative relationship between the productivity of family resources in village economic activities and migration. Because crop production is an important activity, declining productivity on the land increases migration pressures. It also encourages a shift towards less land-quality dependent activities, including livestock production, which unless carefully managed may have a further detrimental effect on land quality, especially in fragile environments. (Taylor 1994)

Taylor notes that the relationship between migration and soil degradation is complex and may exacerbate the destruction of fragile ecosystems in Mexico. There also may be an inverse relationship, where the opportunity to migrate is less costly to a family than the environmental investment needed to increase productivity of the farmland.

> The presence of migration opportunities increases the opportunity cost of investing in environmental conservation. In effect, the environment competes with migration for scarce family resources, including time. The basic problem is that migration is an economic activity the returns to which do not depend on land quality. The availability of such activities tends to discourage land conservation. (Taylor 1994)

Notwithstanding this, Taylor further suggests that remittances sent home from those who migrate could provide a source of funds for conservation investment. This is particularly important given that most farmers in Mexico do not have access to credit. Remittances have largely taken the place of the "missing bank" to finance small farm investments (Taylor 1994).

Integration of Geostatistical Data

In completing our investigation, we analyzed geostatistical information concerning various regions of Mexico affected by aridity and likely to be most affected by desertification. We developed a map identifying migration from rural areas, with a cross-comparison to geostatistical data on aridity in Mexico [see **Maps 7**, **8** pp.25,26]. The information on migration used in preparing these maps was gathered in a survey of Mexican migrants living and working in the United States who were returning to Mexico in 1993 for an unspecified period of time.[14] The information collected in this survey included the last place of residence in Mexico by rural locality of the migrants. This data is significant because it tends to indicate the relative number of people who migrate to

[14]The survey did not attempt to determine whether the migrants intended to return permanently or temporarily for such reasons as vacation or family visit. The survey gathering the data was conducted by Dr. Jorge Bustamante and his colleagues at El Colegio de la Frontera Norte as part of an ongoing, large-scale project funded by the World Bank to produce a direct estimate of the variation of undocumented immigrants from Mexico to be found in the U.S. during the time monitored. This estimate is obtained by focusing on patterns of circulatory migration flows as determined through interviews of randomly selected individuals at a number of Mexican border cities. The project, begun in 1993, will be completed in spring 1994. Because not all data from the survey has been collected and analyzed, we developed our estimates by extrapolating six months of the data, providing an estimate of undocumented immigrants from Mexico in the U.S. in 1993.

The foundational work for the survey methodology consisted of a pilot study in which Dr. Bustamante and his colleagues conducted surveys of migrants at various border crossing points over an approximately six-year period. The new survey methodology used in these interviews was developed based on procedures used to sample mobile populations for biological statistics. The successfully completed pilot study produced the only time series database available on the flows of undocumented migration from Mexico other than the statistics on apprehensions produced by the U.S. Immigration and Naturalization Service and provided the information necessary to determine the proper parameters of the survey and sampling design.

the United States from the rural localities of Mexico.

The use of migration and aridity data in determining precise correlations between migration and desertification is limited for two reasons. First, much of Mexico's territory is arid or semi-arid and we cannot assume that all arid or semi-arid areas are desertified (though, as the government of Mexico concludes, 60 percent of all lands are severely degraded). Second, though there is migration from the rural arid and semi-arid areas, we cannot assume, without further investigation, that all migration identified from these areas is a result of desertification. As discussed above, we do know that the central region of Mexico, which is arid or semi-arid and has a high rural density, has widespread desertification problems and significant out-migration. *Our discussion with experts, research, and analysis of the relevant statistical data (some of which is presented in **Maps 7** and **8**) suggests that further investigation will likely confirm that desertification, as well as other environmental factors, contribute to migration from this region.*[15]

Quantifying Migration Flows

There has been considerable debate on the annual flow of migrants from Mexico to the United States (Durand & Massey 1992:4-5).[16] Estimates range from 150,000 persons per year to between 500,000 and 600,000 persons per year (Myers 1993:144; Durand & Massey 1992:6-9; see also Martin 1993:4-6). Approximately 100,000 to 150,000 of these are expected to settle in the United States (Martin 1993:4). An additional 1.5 to 2 million Mexicans who enter the U.S. illegally each year are considered temporary workers or seasonal migrants expected to return to Mexico.[17] The World Bank projects that between 1995 and the year 2000, an additional 750,000 to 900,000 Mexicans will migrate to the U.S (Martin 1993:5).

[15]Martin (1993) also suggests that the allocation of water and development of irrigation supplies can be a powerful force in motivating internal migration; water projects in northern Mexico have led to substantial internal south to north migration to Sinaloa, Baja, and other areas. Martin believes that, if Mexico undertakes more such water projects in the north (such as would be likely to reduce transportation costs of fruit grown in Mexico and exported to the U.S. market), there may be more "stepping-stone" migration to the United States.

[16]Myers (1993:144) suggests that 150,000 to 300,000 illegally migrate to the United States each year to settle.

[17]"Most Mexicans are expected to continue to arrive illegally; there are estimated to be 1.5 to 2.5 million illegal entries each year, and over 90 percent of those apprehended are Mexicans . . ." (Martin 1993:4)

No one has attempted to determine how many of these migrants leave the rural areas of Mexico because of serious impairment of farmlands or other desertification processes. The time constraints and scope of our investigation did not permit us to undertake any real quantification analysis. Further investigation and data development is warranted to provide a more accurate basis for determining the scope of the problem. However, the lack of precise data on the number of migrants should not paralyze the policy development process, particularly as quantification historically has been an area for fervent debate in the migration field and there may be enough qualified data to warrant policy considerations. Recommended issues for further investigation are discussed in *Conclusions and Recommendations*, below.

CONCLUSIONS AND RECOMMENDATIONS FOR FUTURE ACTION

The relationship between ecological destruction and migration is a phenomenon that has been little studied on a global level. Studies of various regions of the world confirm that migration is increasingly a result of serious environmental degradation, particularly desertification processes that impair the viability of soils and agricultural sustainability.

Mexico has significant desertification problems because much of its lands are affected by arid or semi-arid climate. Historically, it has been the source of large-scale migration to the United States. We undertook a preliminary study to understand better the relationship between severe land degradation in Mexico and migration to the U.S. Our preliminary investigation leads to the following conclusions.

First, there is evidence to suggest that a portion of the migrating population from Mexico to the United States are people who are moving, directly or via Mexico's urban centers, because they cannot farm the lands. The deterioration of the soil base is due to ongoing processes of desertification affected by both climate and unsustainable land and water use practices. Those most acutely affected are subsistence farmers who grow corn and beans for their families to survive.

Second, preventing this migration will require addressing the root environmental causes of the problem, largely associated with inefficient agricultural management. National, regional, and local policies, institutions, and practices in

Mexico likely will need to be reformed. A significant barrier to implementing reforms in Mexico is the lack of education, training, and financial programs for affected farming communities. Too, U.S. domestic policies, particularly in the agricultural sector, may be contributing to these problems and warrant further investigation.

The U.S. Commission on International Migration and Cooperative Economic Development concluded that long-term economic development is the most effective means of preventing international migration in this region (Gregory 1989:31). However, this may not prevent the migration associated with severe ecological damage. Economic development will be more effective if coupled with specific environmental policies, including regulations and financial incentives designed to prevent and redress land degradation and drought (e.g., the lack of reliable water supply). Redressing the problem will require programs to assure the viability of farming and to revitalize salinized soils or otherwise degraded natural resources in affected rural communities.[18]

Third, while the development of data on migration associated with environmental problems is too premature to recommend specific foreign policies, our preliminary analysis reveals that the Commission and Congress will need to look beyond traditional immigration policy to address the root causes of the problem. Precise programs and policies will depend upon the results of further field and analytical study, as described below.

Issues for Further Investigation of the Environment and Migration Phenomenon

The environmental phenomena in Mexico that can give rise to migration and the communities most affected should be investigated more comprehensively to un-

[18]The San Joaquin Valley, an historically prosperous region that produces much of California's agricultural revenues of more than $17 billion, may serve as an example. In spite of its prosperity, the region only recently has begun to address the salinization and other desertification problems that have been building for decades because of poor land and water management practices. These now threaten the viability of 750,000 acres of prime farmland. Thousands of acres have been fallowed because of lack of understanding or attention to the problem by both farmers and regulatory agencies. These groups are now beginning programs to arrest the problem.

derstand better the immigration and foreign policies that could be formulated by United States policymakers to address the problem. The Commission may wish to undertake such investigation or to recommend to Congress that it appropriate resources to conduct the necessary research and field study.

The following specific recommendations are proposed to guide the further action of the Commission and/or Congress:

Further Investigate the Relationship Between Environmental Problems and Migration

Reversing the trends of land degradation in Mexico will be critical in stemming the migration related to unsustainable use of agricultural lands in certain regions. Investigating the links between environment, migration, and population will provide more definitive analysis of these trends and suggest appropriate policy development.

Given the dearth of available field-based documentation on which to formulate policies, further study should seek to determine how influential a role environmental problems play in decisions to migrate. Field research should include interviews of migrants in affected rural communities as part of broader field studies.

It will be important to investigate the regions that suffer the most acute environmental problems and that foster significant involuntary migration because this information can provide a basis for the development of prevention and remediation programs that could yield short- and long-term environmental and migration benefits to both Mexico and the United States.

Specifically, we recommend more precise identification and investigation of the lands currently undergoing desertification in rural, arid, and semi-arid areas of Mexico. For example, a detailed inventory of the lands in the Central Plateau region could enable more accurate correlation of migration from this area and land degradation patterns, as well as provide information on the number of people who may be affected. This will be critical to identifying priority areas for policy responses.

The key will be to build upon and bridge the existing efforts of researchers, officials, and nongovernmental organizations to analyze environmental problems and

population movements in an integrated fashion. For example, new migration data (that will be available soon) is currently being produced by the Colegio de la Frontera Norte and ORSTOM. This data can be used to determine more accurately the migration patterns in Mexico. Data on outmigration from an area can be combined with geographical information service statistics [GIS] identifying areas of land impairment. In turn, this data can be compared with other regional migration patterns. The data can provide a beginning point for locating the most critical environment-migration areas and determining the number of migrants affected.

The relationship between population growth, environmental problems, and migration also should be studied. Population growth increases pressure on scarce natural resources in rural areas. In agricultural regions, when the carrying capacity of the lands are exceeded, people are forced to move. Little is understood about the dynamic between population growth in certain agricultural regions in Mexico and the marginalization of agricultural lands that promotes migration. Any future investigation into the links between migration and environment should, therefore, include analysis of how population growth may affect environment and migration problems.

Finally, understanding climate change in this region also will be important. Certain data already has been developed on climate change and global warming and can be evaluated further and integrated with research on migration and environment issues. Some experts are concerned that declining conditions in rural Mexico, unemployment, and migration will become worse in the event of global warming. If dry regions of Mexico become warmer and drier as global warming models suggest, Mexican croplands and the farmers who rely on low and variable rainfall could be severely affected. Many more rural inhabitants could be forced to migrate (Liverman 1992).

Investigate the Development of Immigration and Other Policies that May Be Responsive to Address Ecologically-Induced Migration

In carrying out its mandate to consider ways to increase the effectiveness of U.S. immigration policy, the Commission may consider proposals to tighten border controls and employer sanctions for the hiring of illegal immigrants. Preliminarily, we analyzed some of these policies to de-

termine their potential in addressing migration related to environmental degradation.

As the Commission is aware, policies to increase border controls and punitive sanctions against employers and certain other measures were adopted under IRCA. These were designed to control the flow of immigration from Mexico to the U.S. Some contend that IRCA has had relatively little impact on stemming undocumented immigration from Mexico (e.g., Massey, Durand & Donato 1992:139-40, 155-56). The policies have become somewhat controversial because it is asserted that they can lead to violence against Mexicans and can drive undocumented workers further underground, leaving no recourse to challenge employer abuses (Huerta 1992:150-51). In addition, certain federal studies have found that these policies tend to encourage discrimination against foreign workers, whether here legally or illegally (Huerta 1992:87-88, 150-51; Mahoney 1992:150-53).[19]

These traditional policy responses probably will not be sufficient to diminish the pressures on migration related to serious environmental deterioration in Mexico because they do not address the root of the problem. However, these policies can be more effective in addressing this type of migration if coupled with agricultural land remediation, training, and educational programs. If the objective of U.S. immigration policy is to address root causes of immigration, then such an objective will need to incorporate broader policies that involve international cooperation, aid, and technical support measures.

Issues to Evaluate in Developing Broader Policy Responses

The United States could play a catalyzing role in encouraging the development of such environmental policies in Mexico, particularly as many federal agencies possess unique expertise in developing water and land management programs, largely as a result of the lessons learned from the salinization and water problems that have plagued the western United

[19]The U.S. General Accounting Office concluded in 1990 that federal employer sanctions resulted in widespread employment discrimination against U.S. citizens and other legal residents, indicating that 20 percent of employers had engaged in discrimination in California as a result of this policy (Coalition for Immigrant & Refugee Rights 1990:6).

States farming regions.[20] However, the application of these programs in Mexico is best determined in conjunction with Mexicans most knowledgeable about conditions in their own country. Thus, the Commission and/or Congress should investigate the opportunity for establishing cooperative programs, as discussed below.

Distinguish Between Environmentally-Motivated Migrants and Other Economic Migrants to Address Environmental Root Causes of Migration

A key concern of the Commission is whether these migrants are different from the broader category of "economic" migrants in ways that may warrant consideration of new policies. Our preliminary findings suggest that *migrants unable to farm because of desertification or drought can be distinguished, for purposes of policy development, from other urban or economic migrants who may be primarily motivated to relocate in the United States because of the wage differential.*

Adverse environmental conditions can lead to increased poverty when families can no longer subsist on their lands. They may be forced to join the growing numbers of other "economic" migrants. However, it appears useful to distinguish between these "environmental" migrants and other economic migrants for two reasons. First, understanding that some segment of the international migration population is primarily motivated to move because of their inability to farm could foster the development of programs specifically designed to stem *this cause* of migration. As discussed below, these could include environmental prevention or remedial measures that preserve agricultural land and promote higher agricultural productivity. Second, because the motivation for leaving their homelands is different from that of other economic migrants, migrants forced to leave because farming is unsustainable may consider returning home if remediation programs are offered. [The findings which support this are discussed in more detail below].

It may, therefore, be useful to target this potential group of migrants for policy responses as a means of addressing or preventing one root cause of migration to

[20]The San Joaquin Valley of California is a prime example. We undertook investigation of these problems for federal and state agencies, producing a 1990 report identifying solutions to the legal and institutional barriers that have contributed to agricultural water and drainage management problems in this region.

the United States. However, the environment-migration phenomena still is too little understood to support recommendations on specific immigration policy reforms, such as the expansion of existing categories of refugees to include persons acutely affected by ecological damage. The Commission should study these issues in further detail.

Investigate How Policy Responses Might Provide an Opportunity for Some Migrants to Return Home to their Communities

The Commission should undertake further exploration of whether it would be useful to develop policies or programs that could encourage immigrants in the U.S., to return to their home communities voluntarily to engage in sustainable farming activities. The Commission could explore the potential for a joint program with the Mexican government to undertake land revitalization programs in certain communities, with the view toward allowing migrants who wish to do so to return home to participate in such programs.

Our preliminary findings suggest that migrants forced to leave because the soils are agriculturally unproductive may consider returning home if they can successfully farm the lands. Michael Kearny, Professor at the University of California, Riverside, who has studied land problems and migration in Southern Mexico where many of the people are indigenous, Mixteca, has found support for this view among those in the migrant as- sociations based in California with which he works (Center for U.S. Mexican Studies 1986). These groups desire to improve the situation in their home communities. Many are circular or seasonal migrants who would prefer to remain at home if they could make an adequate living and, similarly, would like to return home if circumstances could be improved in their communities (Center for U.S. Mexican Studies 1986; Kearny 1994). In our interviews conducted with Mexican migrants living in California who migrated from Mexico's agricultural regions, many who identified land degradation or drought as a factor in the decision to migrate expressed a desire to return to Mexico if they could make a living by farming the lands.[21]

[21]We conducted interviews of two groups of Mexican migrants in San Francisco and Oakland, California in December of 1993. During the same month, we also conducted interviews of workers living in villages with problems of desertification in the San Luis Potosi region of Mexico.

Further, certain studies of migration have found that seasonal migrants may own plots of land in their community of origin and may either return to farm or employ others to farm these lands. This is consistent with our findings in interviews of rural workers in Mexico who informed us that families generally wish to remain on their land and only send one or two family members to seek employment in a Mexican city or the United States when necessary to supplement the family income.

Confirming whether these findings represent the attitudes of a broader base of rural migrants in the United States will be important in thinking through policy responses. U.S. immigration policies have focused on apprehension and deportation as a means of returning illegal migrants to Mexico.[22] Some studies have found that these efforts have not deterred immigration because many of those apprehended on the border and returned to Mexico simply repeat their attempts to enter the United States until they are successful.[23] These policies may be more effective in addressing certain rural migration if supplemented by policies that promote *incentives or programs* for migrants to return home to participate in community farming activities.

In some cases, policies adopted in Mexico to revitalize lands or develop reliable supplies of water and to foster equitable distribution among farmers in a community may serve to encourage potential migrants (those who would be forced to migrate in search of employment if they could not farm the lands) to remain in their communities or to encourage migrants in the U.S. to return home. Incentive programs, organized jointly with Mexican officials, could include providing training and education on sustainable farming methods. Community farmers in Mexico and migrants living in the U.S. could be eligible to participate. (These and other possible programs are discussed below).

Further investigation is warranted to determine the potential for developing immigration policies that could promote the return of rural migrants to participate in agricultural training and development

[22]Since 1964, approximately 17 million Mexicans have been apprehended and deported (see e.g., Durand & Massey 1992).

[23]Data collected by Donato, Durand and Massey provided "no support for the view that apprehension deters migration." Every migrant who attempted to enter the United States eventually got in (Massey, Durand & Donato 1992:150).

programs in Mexico. The potential for such programs to yield results in reducing migration pressures will depend upon more comprehensive data than the findings presented here regarding the desire of migrants to return to Mexico. Specifically, it would be useful to determine, through migrant interviews and other means, whether these findings are more broadly applicable to rural migrants in the U.S. and how immigration policies can be formulated to meet this challenge.

Investigate the Opportunity for Establishing Joint U.S.-Mexico Programs to Address the Migration Related to Environmental Problems

As the Commission appreciates, the creation or modification of certain national, regional, and local policies in Mexico likely will be needed to redress the growing environmental problems, particularly to encourage regulations and permitting practices designed to ensure sustainable harvesting of forests and vegetation. Moreover, programs that seek to improve employment opportunities in Mexico could focus on the improvement of agricultural lands, such as those involving expansion of credit to *ejido* farmers to improve irrigation efficiency.[24] The specific programs that should be considered are discussed more fully in the next section of this report.

Recognizing that environmental deterioration in Mexico can contribute to migration to the United States, Mexico and the United States should cooperate in developing solutions. The Commission and Congress should consider how cooperative programs with Mexico could be developed to promote, finance, and implement environmental mitigation and prevention programs, including the development of model techniques and evaluation of successful agricultural methods developed by indigenous groups in Mexico that can be replicated in other

[24]David Runsten, an agricultural economist affiliated with the California Institute for Rural Studies, believes that there is considerable potential in this type of effort. He has worked effectively to promote the production of fruits and vegetables on *ejido* lands in Mexico. Small *ejido* farmers often do not develop their lands or utilize irrigation because of credit difficulties or exclusion from economic opportunities, problems that may be addressed through financial and other policy reforms in Mexico.

regions of the country. Moreover, the U.S. should consider how best to transfer its considerable expertise and technology to prevent or remediate many agricultural problems.

The benefits of such programs to advance U.S. and Mexican interests go beyond the potential for reducing migration to the United States. The U.S. could benefit economically to the extent that private firms may gain opportunities to participate in technology transfer and consultation. Moreover, increasing productivity of agricultural lands in Mexico will be critical to the long-term sustainability and market competitiveness of Mexican agriculture. The North American Free Trade Agreement [NAFTA] may increase rural migration as agricultural exports from the United States to Mexico displace the agricultural produce of small, inefficient farmers (Martin 1993:137).[25] If farmers are not competitive, they may be required to diversify their incomes or be forced to migrate to urban areas, including in the United States, in search of jobs.

One potential framework for cooperation could be the North American Free Trade Agreement, which establishes certain cooperative mechanisms for consideration and transfer of environmental information. In addition, there are several joint border programs that involve the management of lands associated with the shared natural resources of Mexico and the U.S. These and other mechanisms that could facilitate cooperative program development warrant further investigation.

The Commission also should consider the following issues for further research in developing a framework for environmental cooperation with Mexico and in assisting local communities in Mexico.

Potential Short- and Long-Term Opportunities for the Development of Environmental Solutions

Based upon our preliminary investigation of certain desertification problems in Mexico and our experience in addressing these problems in the western United

[25]Interestingly, NAFTA may increase migration in the short term. Martin (1993:47) estimates that approximately 1.4 million workers will be displaced. This push from rural areas also will be fostered by Mexico's new agricultural policy to reduce subsidies for corn and beans. It may be that environmental remediation efforts could help to balance this “hump” in increased migration by increasing the availability of productive agricultural lands.

States, we have identified certain environmental measures that warrant further consideration as part of any further investigation of the migration-environment phenomenon. These may provide both short- and long-term benefits in addressing the problems. The importance of the measures proposed below will depend upon the precise nature of the problem, the lands affected, the climate, and the community practices within each affected region.

Academic institutions in Mexico, such as the Instituto de Investigaciones de Zonas Deserticas (Universidad Autonoma de San Luis Potosi) already have begun to formulate ideas on model programs that could be undertaken in the local communities most seriously threatened by land and water quality deterioration. It may be useful to consider incorporating such programs into a larger Mexico-U.S. cooperative development assistance program, such as discussed in the previous section.

- Poor cultivation practices and overgrazing have been identified as two of the largest contributors to desertification. The economic and environmental feasibility of the following measures should be evaluated as they can produce immediate environmental benefits:

1. Modification of permitting practices concerning wells to ensure that poor quality water is not used for irrigation;

2. Modification of permitting practices concerning clearing of land for crop cultivation to reduce farming on lands unsuitable for such cultivation;

3. Institution of controlled, sustainable grazing in all areas where grazing is practiced (Ballin-Cortes & Vasquez Rosillo 1993).

   Education, training and economic incentives should be provided to growers in affected areas to promote the following policy goals:

4. Reduction of crop cultivation in areas where soil and/or climate are unsuitable for cultivation and institution of controlled grazing practices or other alternative land uses more suitable to these areas (Ballin-Cortes & Vasquez Rosillo 1993);

5. Reduction of water-intensive dry land crop cultivation and substitution of drought-resistant crops in areas where the land and cli-

mate can support some form of cultivation (Mainguet 1991:32, 213);

6. Education and financing to support implementation of rational, water conserving irrigation systems (to replace systems that mobilize salts and waste resources through overapplication of water).

- Other practices contributing to desertification include unsustainable harvesting of forests and vegetation, poorly planned urban expansion, and public works projects. Any investigation should consider the economic and environmental feasibility of the following measures as they can produce immediate benefits:

1. Modification of regulations and permitting practices to ensure sustainable harvesting of forests and vegetation.

   Measures that can address the problems on a long-term basis include:

2. Education that promotes sustainable harvesting practices;

3. Institution of planning mechanisms for urban expansion, public works, and mining projects that will ensure that environmental considerations are properly evaluated and considered and that will promote effective public participation in their development and implementation.

- Drought and other processes leading to desertification often have more severe impacts where lands are more marginal and where farmers lack irrigation, good fertilizer, high yield seeds, and adequate variety in crops. Further investigation should consider ways to reduce these impacts, including by:

1. Providing financing, technology, and education to expand efficient irrigation systems;

2. Providing financing, supplies, and education to promote use of good fertilizers, high yield seeds, and substantial variety in crops (Liverman 1992b:332).

3. Developing policies to address the factors causing the farming of

marginal lands, including government regulation, high population growth, and agricultural financing.

- Pilot programs with local participation can achieve significant results:

1. The primary difficulties in implementing many of these recommended solutions will be obtaining adequate financing and the cooperation of the rural workers who traditionally have followed particular cultivation, grazing, harvesting, and irrigation practices. One way to achieve the necessary participation may be to carry out model programs or pilot projects to test the recommended changes in land management (Ballin-Cortes & Vasquez Rosillo 1993; Ballin-Cortes 1988b:4). With sufficient financing to reduce the risks, rural communities or *ejidos* may voluntarily participate in these projects.

2. Moreover, if rural participants are closely involved in the development and application of the recommended solutions, the actual solutions designed not only may be more practical, but more influential in fostering change by both the immediate participants and outside observers. If successful, such projects should serve both to demonstrate the desirability of the recommended solutions and to educate the community's farmers.

3. Once recommended solutions have been tested and proven successful, further implementation can be encouraged in a number of ways. First, education can serve to spread knowledge and understanding of the techniques followed in the pilot projects. Second, government incentives can reduce the risks and provide the motivation needed to undertake changes. Third, government regulation and permit policies can attempt to halt or diminish practices that are clearly harmful and ensure consideration of environmental effects.

EXECUTIVE SUMMARY

French enforcement of laws penalizing illegal alien employment is of particular interest to U.S. policymakers. In France, where enforcement of employer sanctions has been less controversial than in the U.S., the major complaint has been that there is too little enforcement. While some French and American scholars have dismissed French enforcement as a serious deterrent to illegal alien employment, the French government steadily has refined and improved its capacity to punish illegal employment of aliens over the last quarter century. It possesses a substantially more credible ability to detect and punish illegal alien employment now than it did in 1968 when such employment was tacitly condoned. However, concommitantly, internal and external developments have rendered France increasingly vulnerable to illegal alien employment. Restructuring of the French economy, for instance, has expanded the role of small employers—more likely to employ aliens illegally—at the expense of large firms.

The French strategy has evolved through time. The effort to curb illegal alien employment has been subsumed under a broader campaign against illegal employment and the underground economy in general. An interagency taskforce charged by the French government with monitoring and facilitating enforcement of laws against illegal migration proposed widening of its mandate. Its studies revealed illegal alien employment to be characteristic of certain industries and of employers typically involved in other forms of illegality in addition to their illegal employment of aliens. The broader focus has served to demystify illegal employment (what the French commonly call clandestine employment) as more French nationals than aliens break laws against illegal employment. However, a disproportionally high number of alien employers employ other aliens illegally and these employers receive more severe punishment than comparable French national offenders.

French enforcement of laws against illegal alien employment has encountered numerous obstacles, ranging from insufficient interagency cooperation in enforcement to legal system unrespon-siveness, to cases brought against employers who hired aliens illegally. In many areas, barriers have been overcome incrementally; in others, they persist. Illegal alien employment continues but would be much greater in the absence of employer sanctions enforcement and related measures. More rigorous enforcement would entail greater commitment of budgetary and enforcement personnel resources, a com-

mitment that has grown incre-mentally over the years.

The French approach to curbing illegal employment could be emulated in the U.S. The first step would be to create an inter-agency taskforce charged with monitoring and facilitating enforcement of laws against illegal employment, most prominently illegal alien employment. Such a step would appear consistent with the commitment made by the U.S. when it signed the agreement creating the World Trade Organization. The entity should be small but endowed with a research staff and budget. It should prepare an annual report on enforcement of laws against illegal employment. Its mission should include training and education of various enforcement services and a mandate to sensitize courts and prosecutors to the harm caused by illegal employment.

Subsequent steps might include: 1) creation of regional, state, and local advisory committees designed to facilitate enforcement of laws against illegal employment; 2) enactment of voluntary agreements amongst employ-ers in heavily-affected sectors designed to promote employment transparency and a level playing field for competition; and 3) implementation of a more secure employee eligibility verification system.

Recent progress in France includes a system in which employers notify authorities of a new employee's identity prior to the onset of employment. The system has secured a high degree of voluntary compliance from employers and promises to make legal punishment of illegal employment more certain. The most recent French enforcement statistics suggest that the effort begun more than one-quarter century ago is bearing fruit.

INTRODUCTION

Continuing controversy in the United States over the wisdom of laws penalizing illegal employment of aliens is unique among Western democracies. Most Western democracies, as seen in **Table 1** [pp.30-33], have adopted and refined employer sanctions over the last twenty years. The issue of enforcement of employer sanctions has been much more controversial. There is less confidence now than there was twenty years ago concerning the efficacy and deterrent potential of employer sanctions. To the extent that they are controversial outside the U.S., the complaint usually is that enforcement is inadequate in light of mounting illegal migration.

Of the universe of Western democratic experiences with employer sanctions en-

forcement, the French case is in many respects the most pertinent to the United States. France has a long immigration tradition with substantial citizen and resident alien minority populations. In 1930, aliens constituted roughly the same percentage of the total population of France, about 7 percent, as they do today. After 1945, France actively pursued demographic goals through immigration policy, but it also massively recruited foreign labor. Technically, illegal immi-gration was commonplace but tolerated. By 1970, the alien population stood at more than four million. One out of every three construction workers and one out of every four auto workers were foreigners. However, mounting eco-nomic and sociopolitical difficulties contributed to a 1974 decision to stop most further foreign worker recruitment.

Since 1975, the French government has allowed family reunification for resident aliens and admission of refugees. But, despite recurrent legalization policy, it has taken an increasingly tough stand against illegal immigration. The laws and regulations summarized in the **Appendix** [p.42] testify to the incremental development of a con-siderable govern-mental capacity to punish illegal alien employment and illegal employment practices in general.

In 1992, France admitted 135,000 aliens to residence (Lebron 1993:3-4). This represented a 10 percent increase over the 1991 total, but a tiny fraction of France's total population of almost 57 million. Of the 135,000 legal admissions, some 56,000 were family members of legally resident aliens or French citizen and 11,000 were refugees. While these numbers seem small in relation to the U.S. admissions, the magnitude of legal immigration to France and the United States is roughly the same, about 0.4 percent of the total population. (This is Jonas Widgren's calculation.)

From 1975 to 1990, the characteristics of the legal resident alien population of France evolved markedly. These changes have been analyzed at length by Claude-Valentin Marie and are summarized here (Marie undated.a.). While the total resident alien population stabilized at about 3.6 million, in part due to liberal naturalization and nationality laws (95,000 aliens became French citizens in 1992), alien employment declined by 14 percent over the period while total French employment increased 8 percent. Foreign workers disproportionally were affected adversely by recession and economic restructuring. Nearly 500,000 foreign workers lost employment in industry over the period, with aliens accounting for nearly one-half of all jobs lost in the auto industry. Unem-

ployment of resident aliens in France today is roughly double that of the French national rate (10.3 percent). Some resident alien groups, such as Algerians, have unemployment rates greater than 25 percent. Many of the unemployed foreigners are older, for example, laid-off auto workers hired in the 1960s, but there is also extremely high youth unemployment. North Africans, in particular, face enormous barriers including educational problems and discrimination.

Resident aliens, like French citizens, increasingly find employment in services. Indeed, in 1975, two-thirds of alien employees worked in the manufacturing and building sectors, whereas only one-quarter were employed in services. Today, those proportions are reversed. A 1991 Ministry of Labor survey estimated that 38.9 percent of alien employees was employed in services and that this constituted the premier employment sector for aliens.

These broad trends have affected illegal immigration and illegal alien employ-ment in France. For instance, aliens in the 1990s are much more likely to be hired by small firms with fewer than ten employees than was the case two decades ago. There was, and is, little illegal alien employment in highly-unionized auto plants. However, most aliens now are hired by small firms that historically have been more prone to hire aliens illegally. The shift from industrial to service employment and trends toward greater labor market flexibility, declining unionization, and growing precarious-ness of employment all have contributed to a flourishing underground economy.

In the quarter century since the May/June events of 1968, which marked a turning point in French policies toward international migration, the government gradually subsumed its campaign against illegal alien employment under a broader campaign against illegal work. This shift reflected a learning process, as well as the influence of public strategies adopted elsewhere in the European Union, particularly in Germany.

SCHOLARLY DISAGREEMENTS OVER EMPLOYER SANCTIONS IN WESTERN EUROPE

In recent years, a number of American and European students of migration have expressed viewpoints on employer sanc-

tions enforcement, but largely in passing. James F. Hollifield (1992) is skeptical of the capacity of Western governments to regulate international migration in general, principally due to the extension of rights to migrants and to the complexity and extensiveness of economic interdependence. He is dismissive of employer sanctions. In an important chapter on illegal migration in Western Europe, Catherine Wihtol de Wenden (1990) found them to be weakly enforced. George Tapinos, Jean-Pierre Garson and Yann Moulier-Boutang similarly have scoffed at the seriousness of employer sanctions enforcement in France.

One of the most detailed and widely available examinations of French efforts to curb illegal alien employment and residency is made by Patrick Weil (1991:223-27). He holds that ". . . the application of repressive laws has revealed itself to be particularly difficult." He regards enforcement of the panoply of French laws designed to curb illegal migration a "failure." At one point, echoing a charge made by the French specialist on foreign seasonal agricultural workers Jean-Pierre Berlan, Weil suggests that there is an understanding between enforcement agents, various ministries, and employers not to apply employer sanctions. Such charges also have been levelled, off the record, by some usually highly knowledgeable officials of international organizations and even by some French government officials. However, the charge also is denied heatedly by many others.

Other experts on immigration to France have been more upbeat in their assessments. Jacqueline Costa-Lascoux (1990) has taken exception to the viewpoint that such laws are merely symbolic by pointing out that laws are supposed to have an educational, symbolic function and that it is a rare law that overnight eradicates the ill that motivated its promulgation. Claude-Valentin Marie, who has been following enforcement of laws against illegal employment, including illegal alien employment, for the French government also has been more generous in his assessment (Marie 1993b, 1994). He points to significant progress in enforcement since 1987 and especially since 1990. In this respect, he echoes earlier optimistic assessments made by experts at the interministerial mission charged with monitoring and facilitating application of laws against illegal employment.

[These viewpoints were reflected in earlier reports and congressional testimony by the author on the subject of employer sanctions enforcement in Western Europe, which is summarized and updated below.]

IMPLEMENTATION AND MAJOR REVISIONS IN FRANCE

By 1976, the Interministry Liaison Mission to Combat Manpower Traffick-ing was formally created, and a law passed in July of that year reinforced penalties against individuals who aided illegal migration and created an administrative penalty for employers of aliens not entitled to work. Employers who hired aliens illegally were required to pay the National Immigration Office a sum equivalent to 500 times the minimum hourly wage for each worker illegally employed. In 1980, the fine was approximately $1,000 per worker. In principle, imposition of the fine was automatic and offending employers also could be imprisoned for one to two months—or longer in the case of recurrent offenders.

A major difference between French and German administration enforcement of employer sanctions was the German inclusion of enforcement of employer sanctions against illegal employment of aliens within the German Ministry for Labor and Social Affairs broad mandate to combat the underground economy in general. The French Interministry Liaison Committee to Combat Manpower Trafficking mandate was far narrower and limited to suppression of illegal alien entry, residency, and employment. This administrative contrast ended in 1989 when the French Interministry Liaison Committee to Combat Manpower Traf-ficking was renamed the Interministry Liaison Ministry to Combat Illegal Work, Undeclared Employment and Manpower Trafficking (Arrete Interministeriel 1989). The scope of its responsibilities was extended, as in the German case, to the entire underground economy. This expanded mandate long had been advocated by officials of the former Interministry Liaison Mission to Combat Manpower Trafficking.

One of the major functions of the Interministry Liaison Mission was to keep track of enforcement of the panoply of laws aimed against illegal immigration and employment. Employer sanctions are only part of an impressive legal arsenal that has built up. **Graph A** [p. 40] presents an overview of overall legal enforcement between 1976 and 1984 as measured by communicated legal complaints (*procès-verbaux*) made by various enforcement agencies (the top line representing the combined total). The graph reveals a 1976 upsurge in enforcement followed by a decline, precipitous in 1977, 1978, and 1981, prior to a resurgence in 1982 and 1983. The graph traces the number of legal complaints communicated by each of the four agencies involved with enforce-

ment of French laws against illegal immigration and employment.

Graph B [p. 41] portrays the number of infractions by employers against section L 341-6 of the Work Code that specifically penalizes employers for hiring irregular-status aliens. Strictly speaking, the level of enforcement of employer sanctions corresponded to the up and downs in overall enforcement of laws aimed against illegal immigration and employment and centrally affected those variations.

The annual report on the year 1979 by the Interministry Liaison Mission summarized the first four years of enforcement of the 1976 law reinforcing employer sanctions (Mission de Liaison 1980:2):

> After four years of functioning, it is necessary to recognize that the objective was not totally attained and that irregular-status alien employment remains an important problem both with regard to the employment situation and on the social and human level of those workers themselves. On the other hand, it is difficult to evaluate the number of clandestine foreign workers thus to know whether it is more important in 1980 than it was in 1976.

Implementation of employer sanctions over the period was complicated by a number of factors. Among those was the continuation of legalization despite the intent announced during the Fontanet-Marcellin Gorse decrees period of the early 1970s to terminate the practice. A number of "exceptional" collective legalizations occurred during this period, particularly in the spring of 1980 when some 4,000 Parisian garment industry workers, primarily Turks, were granted legal status. The legalizations diverted manpower resources, as a good number of labor inspectors—always in short supply—were involved with the legalization efforts.

There was also a notable surge in deportations during this period. A 1975 law made illegal alien employment a deportable offense for aliens. A 1980 law appreciably increased the government's deportation powers. By 1980, depor-tation seems to have become a major sanction to illegal employment. According to Garson and Moulier-Boutang (Unpublished:21-23), "With the law of January 10, 1980, deportation had become simultaneously a priority means of combatting clandestine immigration, but also a means to rendering precarious (the legality) of alien sojourns in France."

The French law of October 17, 1981, made employment of irregular-status aliens a

criminal offense subject to fines of 2,000 to 20,000 francs and imprisonment from two months to a year. For repeat offenders, the prison term could reach two years and the fine 40,000 francs. The fine could be imposed as many times as there were individual aliens involved. However, a legalization program was simultaneously announced and employer sanctions were not to be enforced until after the termination of the legalization period. Contrary to expectations, the legalization period was prolonged as additional categories of aliens, such as seasonal workers, were permitted to apply for legalization. Hence, the marked drop in enforcement of employer sanctions in 1981, as indicated in **Graph B**, was linked directly to French legalization policy.

Enforcement of employer sanctions did not begin again until well into 1982. On August 31, 1983, the French government adopted a series of measures proposed by the Interministry Liaison Mission that simultaneously aimed at reinforcing the effort to curb illegal alien residency and employment while promoting the "insertion" of legally resident alien communities in France. This linkage was made explicit in the 1983 annual report of the Interministry Liaison Mission (Mission de Liaison 1984:21):

> Stopping clandestine immigration, combatting employers of irregular-status aliens and controlling migratory fluxes effectively constitute a priority objective (for the French government). Failure in this case would put in doubt the insertion of legally resident alien communities in France.

The August 31, 1983 measures increased the administrative fine for employers of irregular-status aliens from 500 to 2,000 times the minimum hourly wage for each alien illegally employed. As of January 1, 1985, the administrative fine was 26,340 francs, roughly $3,000. The Interministry Liaison Mission staff was increased, allowing the Mission to open up a regional office in Marseille. An increase to fifty-five in the number of specialized labor inspectors was authorized. In September, the Minister of Justice addressed a memorandum to all public prosecutors which reiterated the government's viewpoint regarding the grave consequences of illegal alien employment and called upon prosecutors to step up enforcement of laws prohibiting illegal alien employment. Prosecutors also were asked to "rigorously apply" the text of the laws concerning penalties.

In June of 1984, the first of twenty-three priority departmental coordinating committees, authorized by a govern-mental memorandum (*circulaire*) of November 21,

1983, came into being. The objective of the coordinating committees was to facilitate the exchange of information to detect and more effectively impose sanctions for violations stemming from illegal alien employment. The Paris-area coordinating committee included representatives from the police, fiscal authorities, the Department of Labor and Employment, the Department of Sanitary and Social Affairs, the National Employment Agency, the National Immigration Office, the enforcement arm for social security and family allowance taxes [URSSAF], and the departmental authority for state finances and economic affairs. Representatives from other public organizations and the prosecutor's office also were invited. The Paris-area coordinating committee has served since as the model for coordinating committees established in other priority areas.

The termination of legalization, com-bined with the measures taken in 1983 and 1984, resulted in an increase, as measured by legal complaints com-municated to the Interministry Liaison Committee, in enforcement of laws against illegal immigration and employment. The total of 2,245 *procès-verbaux* communicated to the Mission in 1983 was the highest ever. The number of *procès-verbaux* for infraction of article L 341-6, which prohibits employment of irregular-status aliens, rose from 549 in 1982 to 947 in 1983. The increase in legal complaints was matched by increased court action, enforcement of the administrative fine, and penalties against employers of irregular-status aliens. About 1,300 court decisions ordering employers to pay fines of at least 2,000 francs were made during 1983. In Paris, the first six months of 1984 witnessed a 50 percent increase, relative to the 1983 period, in the number of persons found guilty of employing illegal aliens. The Director of the Interministry Liaison Mission summed up the judiciary's handling of employer sanctions over the first six months of 1984 (*Le Quotidien de Paris* 1985):

> The sampling of judgements rendered during the first half of 1984 by various courts appears to us as very indicative of the current tendency toward harden-ing of legal counteraction vis-a-vis employers of irregular-status aliens. The great majority of fines are to be found from now on above the minimum provided by the law, which denotes a clear cut understanding by the courts of matters connected to man-power trafficking.

There was clearly an official perception that enforcement of employer sanctions was beginning to bear fruit by 1985. The 1981-1983 period was seen as a stage in which the policy instruments decided

upon in 1981 were "broken in" and in which the policy outlined in 1981 on paper took concrete form. In March of 1985, Georgina Dufoix, Minister of Social Affairs and National Solidarity and the spokesperson for the French government, declared that the results of enforcement of laws against illegal immigration and employment had a ". . . very encouraging balance sheet" (Agence France Press 1985).

The Interministry Liaison Mission report on the 1986-1987 enforcement period included a revised summary of enforce-ment as measured by legal complaints. This statistical series, presented in **Tables 2** and **3** [pp. 34, 35], excludes citations for illegal housing of aliens. **Tables 2** and **3** reveal a dip in infractions communicated, particularly for employment of aliens without permits and illegal (underground) labor in 1985 and 1986. French officials and labor inspectors interviewed in 1987 and 1988 spoke of a "demobilization" over this period linked to the uncertainty created by a decision not to prosecute a large case because of the ambiguity of the law under which the citations had been made (the provision of the Labor Code prohibiting illegal or underground labor, *travail clandestine*) and to the changes in French government.

In an October 1987 address of unusual candor, the new director of the Interministry Liaison Mission maintained (Hue 1987:4) that the level of legal complaints ". . . is of little impact and unrevealing of a mass of legal conten-tions which is *a priori* surprising since illegal employment is a widespread mass phenomenon." She particularly criticized the disjuncture between statistics on condemnations of aliens for illegal entry and/or residency and the number of infractions for manpower trafficking.

	Condemnations for Illegal Entry & Residency	Infractions
1984	15,120	4,131
1985	10,404	3,608
1986	16,506	3,655

Director Hue also was critical of the geographical imbalance in enforcement, noting that more than 84 percent of the legal complaints originated in three regions. Moreover, two-thirds of the legal complaints for illegal alien employ-ment were dismissed by provincial courts as opposed to less than 10 percent in the Paris region. Parisian area courts assessed fines of more than 10,000 francs on 53 percent of the individuals punished and condemned 56 percent of them to a prison term as opposed to only two out of every seven such individuals in the provinces (Hue 1987:4).

The speech concluded with questions on the efficacy of the effort being made to curb illegal employment, of which illegal alien employment was a significant com-

ponent: Were the means utilized appropriate and sufficient? Was an essentially social and repressive approach to the problem a wise choice? Was the oft-affirmed political will to curb illegal employment truly there? Did enforcement services possess sufficient understanding and know-how to implement policy? Overall, Hue's (1987) assessment was that the action under-taken to that date was unsatisfactory as legal complaints were insufficient and negatively perceived by enforcement services. The results were not propor-tional to the effort being made.

The demobilization of the 1986-1987 period seems to have marked a nadir. In 1987, a revised legal text was adopted redefining illegal employment and the period of cohabitation in French government ended. This led to a "remobilization" reflected in an upsurge in citations communicated in 1987, particularly for employment of aliens without permits. A dramatic increase in enforcement, as measured by legal complaints for illegal employment of aliens, continued in 1988 and 1989 (Hue 1990a).

Employers convicted under the panoply of laws aimed at curbing illegal alien employment and residency in France expressly were excluded from the pardons traditionally extended at the onset of a new presidential term. This exclusion was intended by the government to underscore the gravity of the social harm caused by illegal employment of aliens and the seriousness of the government's intent to combat illegal alien employment and residency. Illegal employment of aliens in France had always been viewed as a dimension of a broader problem of illegal employ-ment practices. However, by the late 1980s, what had begun as a campaign against illegal alien employment had been largely subsumed under a cam-paign against illegal employment in general. The focus was less on alienage and immigration policy and more on violation of labor laws. This shift was reflected in the reporting on enforcement of laws as statistics were changed and refined. The data reported here discretely in various tables and graphs cannot be collapsed into one series.

The most recent French governmental statistics are concerned with enforcement of laws against illegal employment practices in general. Punishment of illegal alien employment is one dimen-sion of the broader enforcement effort.

Table 4 [p.35] reveals that the building sector experiences the highest level of delinquency whatever the specific violation. When overall employment in this sector expands, violations of labor laws expand as well in a proportional manner.

Hence, **Table 5** [p.36] is unsurprising. Roughly one-third of all legal complaints and infractions cited concern the building sector alone. Indeed, violations of proscriptions against illegal employment are very concentrated in a few industries. The building industry, agriculture, commerce, hotels, cafes, and restaurants account for seven out of ten cases overall.

Table 6 [p.36] suggests that the intense legislative and regulatory activity chronicled in the **Appendix** was paralleled by non-negligible net results in quantitative terms in enforcement. However, interpretation of the statistics must be guarded. For instance, is the increase in legal complaints against illegal employment of aliens from 1989 to 1990 an indication of improved enforcement or a reflection of growing illegal alien employment? Is the decrease registered from 1990 to 1991 a hopeful, or adverse, indication? One can only report that the best-informed officials felt that progress was being made. There was deterrence. There would be greater deterrence with greater resources.

The principal novelty of the most recent French reporting on enforcement of laws against illegal employment was a finding that three-quarters of all employers sanctioned were French citizens (69 percent of the total) or citizens of the European Union. This fact was widely publicized to correct the commonplace equation of clandestine or illegal employ-ment with immigration. Illegal alien employment, the reporting emphasized, was but one dimension of a much broader socioeconomic problem.

Table 7 [p.37] is based on a Ministry of Justice analysis of legal proceedings for violation of laws against illegal employment in 1988 and 1989. Over those two years, more than 6,131 persons were convicted for a total of 7,244 punished infractions. Convictions for illegal alien employment constituted only one-quarter of total convictions. While three-quarters of the convictions involved French and European Union citizens, non-European Union aliens constituted 21.5 percent of all those convicted—a much higher proportion than the 6.6 percent share of aliens in the total population of France. North African-origin employers predominate among aliens convicted for illegal employment practices that disproportionately involve illegal alien employment. Three-quarters of convic-tions for illegal work involved French citizens, who may or may not be of immigrant origin, while 15 percent of such convictions involved aliens. However, only 52 percent of convictions for illegal alien employment involved French citizens, while 37 percent involved non-European Union aliens (Marie undated.a).

Overall, one-quarter of the convictions for illegal work resulted in incarcerations. The study concluded that the severity of punishment for illegal work was greater than for other comparable offenses. Moreover, illegal alien employment was more severely punished than other illegal work transgressions. This can be seen best by comparing average fines for illegal work and for illegal alien employment in **Table 8** [p.38], which similarly is derived from the Ministry of Justice analysis. According to Claude-Valentin Marie (undated.a:28):

> Three major traits characterize the punishment of unauthorized alien employment as compared to that meted out for clandestine work: it is more severe; it is the object of more extreme views by judges; and fines for it are heavier. Incarcerations are slightly more prevalent in cases of unauthorized alien employ-ment and sentences rarely are partially suspended as judges opt for either incarceration or total suspension of sentence. The level of fines levied for unautho-rized alien employment is superior to that levied in cases of recourse to clandestine workers. Regardless of the type of infraction, aliens from non-European Union countries are punished more severely than are French citizens.

The most recent French reporting on enforcement of laws against illegal work suggests, thus, that progress is being made in making the court system more responsive to violations of laws prohibiting illegal alien employment. Enforcement of employer sanctions in France has a deterrent effect but, in many respects, is insufficient. Nonetheless, considerable progress has been made over the last two decades. Now, the French government has a credible, if limited, capacity to prevent illegal alien employment; one-quarter century ago, it had none. Indeed, back then, illegal alien employment was tolerated and accepted. It is much less so today, although the present global migratory situation contributing to illegal alien employment in France is more alarming than several decades ago. Moreover, deregulation, liberalization, and other changes in the French economy since 1968 have made prevention of illegal alien employment more difficult.

PROBLEMS AND ISSUES IN ENFORCEMENT

Evolution of the Administrative Fine (Special Contribution) for Illegal Employment of Aliens in France 1977-1992

Since 1977, the Office of International Migrations [OMI], formerly the National Immigration Office, which holds a legal monopoly over recruitment and admission of foreign workers in France, has been empowered to recover an administrative fine, called the Special Contribution, from employers who illegally hire aliens. The legal rationale is to heighten punishment of an offending employer because he or she violated the OMI monopoly. Hence, the administrative fine is separate from judicial punishment for illegal employment of an alien. It is also, in principle, separate from complementary fines for nonpayment of social security taxes, etc. The Special Contribution is an automatic fine, subject to admini-strative appeal, that punishes an employer irrespective of the outcome of legal proceedings.

Administratively, a special contribution should result from every infraction for illegal alien employment. However, OMI must be notified by the director of a departmental labor and employment office of an infraction in order for OMI to levy the Special Contribution. Most citations for illegal alien employment are made by labor inspectors, but police, gendarmes, agricultural inspectors, and other corps also can write up violations. The enforcement powers of the various services vary. Labor inspectors, for instance, can inspect any site without prior notification; they cannot verify identities; they call upon the judicial police to do that. The judicial police must have a justifiable motive for entering a business; they cannot conduct random verifications of identities. Enforcement, thus, usually involves interagency cooperation. When a labor inspector writes up a citation for illegal employment of an alien, it has the force of law unless overturned or forgiven during appeal.

According to Bernard Vachette (1990) of OMI and to other sources interviewed over the years, many citations for infractions of the law barring illegal employment of aliens, which arrive in the form of dossiers at OMI, were not transmitted by departmental directors in the late 1970s and early 1980s. Progress in transmission of dossiers was reported in the 1983-1984 period.

By 1990, a debate had developed over the Special Contribution. Many enforce-ment personnel and administrators felt the 32,000 franc fine was too high and was disproportionate relative to punishment for other comparable offenses. Several labor inspectors reported that they hesitated to write up illegal alien employment infractions because of the severity of the admini-strative fine that increasingly was accompanied by other punishments. Writing up an infraction could put small and marginal firms out of business. Sometimes only one violation would be written up when additional aliens were illegally employed and/or additional citations could be made. French labor inspectors are entitled to use their discretion in the public interest. Several inspectors cited aggravation of unemployment, already a major preoccupation in France by 1990, as a reason for not writing up infractions.

This debate contributed to the falloff in Special Contribution notifications in 1990 seen in **Table 9** [p.39]. The decree of November 8, 1990 modified the Special Contri-bution. Three levels of Special Contri-butions, tailored or modulated to the nature of the illegal alien employment offense, were instituted. The normal fine henceforth would be 1,000 times the minimum hourly wage (16,870 francs as of July 1, 1992). An augmented fine would be due from employers who already had been subject to the Special Contribution in the five years prior to the infraction. The augmented fine was 2,000 times the minimum hourly wage (or 33,740 francs as of July 1, 1992). A reduced fine was inaugurated for illegal employment of an alien that was not accompanied by other infractions. Such a reduction was at the discretion of OMI consequent to a recommendation from a department-level director of labor and employment. This same decree instituted a 10 percent surcharge on the Special Contribution if it were not paid within two months of notification of the employer. An interagency directive made application of the November 8, 1990 decree retroactive to cover all dossiers in which there had not been notification of the fine or that were under appeal. This procedure lasted until the end of 1992. During this period, a new computer-assisted procedure for administration of the Special Contri-bution was put into place and became operational as of December, 1991.

Citations for illegal alien employment increased in 1991, but they dipped again in 1992. The primary reason for the decrease was the change in legal status of Portuguese and Spanish nationals in that year. They became European Com-munity workers.

In 1992, 2,498 Special Contributions were assessed—the highest level ever. Between 1977 and 1992, a total of 25,942 infractions for illegal employment of aliens had been transmitted to OMI. The annual average of Special Contribution fines levied between 1977 and 1989 was 1,370. Hence, French officials inter-viewed in 1993 and 1994 spoke of significant progress in enforcement of employer sanctions.

The severity of the Special Contribution fine, in addition to judicial punishments for illegal alien employment and punishments for related offenses like nonpayment of social security taxes, figured in the sharp drop in recovery of Special Contribution fines between 1985 and 1989. OMI received only 11.41 percent of the Special Contributions levied in 1985, 7.79 percent in 1986, 4.28 percent in 1987, and 3.24 percent in 1989. Data for 1990 and 1991 were not comparable. However, by 1992, the recovery rate had increased to 18.64 percent.

OMI reported that "the reform made in 1990 and the amelioration of manage-ment procedures regarding recovery and issues surrounding it have therefore allowed a clear redressing of the situation and even contributed to heightened efficacy of this administrative sanction" (L'Office des Migrations Internationales 1992:77-78). Nevertheless, numerous obstacles to recovery remain. A dispro-portionally high number of illegal alien employment cases involve employers who themselves are aliens. They frequently repatriate and do not pay the fine. Other employers declare insolvency or are imprisoned and cannot pay.

Other Legal Barriers

As already noted,the French government responded incrementally, and ultimately constructively, to the reluctance of public prosecutors to pursue charges against employers by revising legal texts. In one noteworthy case that adversely affected overall enforcement of sanctions in France in 1986, a public prosecutor found the provisions in the Labor Code prohibiting illegal employment (under which charges had been brought against an employer employing some 350 aliens) ambiguous. Therefore, all 350 charges were dropped with a resultant demor-alizing effect upon those charged with enforcement. The dismissal led to redrafting of the legal provision in question and subsequent adoption of the redraft as law. The result was the remo-bilization suggested by the upsurge in citations made by labor inspectors beginning in 1987.

Whatever the shortcomings in the responsiveness of French courts to employer sanctions, it must be recalled that a great deal of enforcement is not recorded in statistics kept on court cases. Administrative and other sanctions, such as fines collected for nonpayment of mandatory health insurance premiums, are not recorded. And many enforcement activities have a deterrent effect even if they do not result in the writing up of complaints and successful prosecution of employers in the courts.

Laws that prohibit illegal employment of aliens seem to be adhered to by many, if not most, employers, a non-negligible deterrent to greater illegal migration. A minority of employers either ignore or consciously violate the prohibition. And there is reason to believe that this minority is growing despite enforcement efforts.

Prosecution of violations of social legislation is always difficult. Agricultural law inspectors, in particular, tell of presumably illegally employed workers running into the fields as they approach. Labor and agricultural inspectors need the cooperation of the police to apprehend the employees in such situations. Prosecution of employers under criminal law, of course, must comply to standard rules of evidence and procedure. Complaints generally are not written up unless, in the opinion of an inspector or other enforcement agent, all the elements of a successful case are there. A number of enforcement agents pointed out that investigations and visits that did not result in the writing up of complaints and prosecution undoubtedly had a deterrent effect upon employers.

Insufficient Enforcement Personnel and Resources?

An upsurge in criminality over the last several decades has fed anti-immigrant sentiment and profoundly affected politics in a number of Western European states. Court systems and law enforcement agents have been sorely tried by the resultant mass of litigation. Enforcement agents have far broader responsibilities above and beyond enforcement of laws prohibiting illegal employment of aliens. For many labor inspectors and police officers, enforcement of employer sanctions is a low priority. Labor inspectors, in particular, often do not write up complaints for infractions that they detect because there are other enforcement priorities in their eyes. This is why the Interministry Liaison Mission in France devotes most of its effort, in addition to studying illegal migration and illegal alien employment, to informing enforce-ment agents about the various laws penalizing

illegal alien employment and the priority attached to their enforcement by the government. Members of the Marseille branch office of the Inter-ministry Liaison Mission have noted an upsurge in citations, particularly by the Gendarmerie or national rural police, in the wake of their visits.

Labor inspection historically has been based on inspections of factories. Most illegal alien employment is not to be found in large factories, which often have a substantial union presence. Illegal alien employment is concentrated in small businesses, in an environment that is different from the classic focus of labor inspector training and service. This disjuncture between the focus of labor inspection and the focus of illegal alien employment adversely affects enforce-ment of laws prohibiting illegal alien employment. By training, labor inspectors look for unsafe working conditions more than for illegal alien employment. Enforcement of laws prohibiting illegal alien employment is largely incidental to routine enforcement of social legislation by enforcement agents. Enforcement agents must have a reason to suspect illegal alien employ-ment, for example, a letter of denun-ciation or a telephone tip, before launching a nonroutine investigation.

Inadequacy of enforcement personnel and resources is the factor most cited by authorities in charge of enforcement of employer sanctions in Western Europe in discussing problems of enforcement. In the key agricultural department of the Vaucluse in May 1990, for example, there were five enforcement personnel with a budget of some 38,000 francs. The agricultural inspector explained that budgetary constraints greatly limited the number of inspections that could be made. While enforcement of employer sanctions was thought to have a deterrent effect, it was clear that budgetary and personnel limitations restricted enforce-ment. The Vaucluse example is illus-trative of a limitation in employer sanctions enforcement across western Europe.

Is there a disjuncture or a gap between laws and governmental policies that call for steadily harsher punishment of illegal alien employment and the reality of limited personnel and other resources allocated to employer sanctions enforcement? To western European critics of the level of employer sanctions enforcement, the answer is clearly, "Yes." But this viewpoint tends to ignore a perceptible, if incremental, increase in personnel and other enforcement resources allocated to enforcement of employer sanctions over the past fifteen years. Director Hue of the Interministry Liaison Mission explained that the mission regularly requested greater resources. Usually most of their requests were denied, as the government

had other priorities, but always there was an incremental increase in the capacity of the French government to punish illegal employment of aliens. For example, it was difficult for the Mission to obtain additional labor inspectors specialized in enforcement of laws pertaining to aliens in a political atmosphere dominated by calls to reduce the presence of state regulation in French business activity. Enforcement of laws prohibiting illegal alien employment clearly is a function of the personnel and other resources allocated to it. It seemed obvious that the level of enforcement could be increased if there were the political will to expand the commitment of enforce-ment personnel and other resources.

Still, the commitment of enforcement personnel in France by 1994 was considerable. According to information supplied by C-V. Marie in March of 1995, the French corps of labor inspectors includes 2,910 agents authorized to make inspections; 32 agents specialize in illegal employment enforcement. All together, the labor inspectorate made 284,921 site inspections in 1992 and witnessed 921,856 violations. Of the 23,345 of these that were written up, 2,270 concerned illegal employment.

Within the Ministry of the Interior, a new agency, known by the acronym DICILEC, was created in late 1994, mainly out of the Air and Frontier Police. It is a specialized agency for control of immigration and illegal employment, although its mission was not entirely clear as late as November of 1994. It has 950 operational agents, of whom about 100 have administrative jobs. Additionally, Officers of the Judicial Police play an important role. Overall, there are about 4,000 police potentially competent to enforce laws against illegal employment.

The number of fiscal agents available to write up citations for infractions related to illegal employment, nonpayment of employment taxes for example, is estimated at 1,100. Agents from the Gendarmerie, customs, maritime affairs, and social security also participate in enforcement, but estimates of their numbers in enforcement of laws against illegal employment are unavailable.

Problems of Proportionality, Employer Adaptation, and Coordination

An additional problem of enforcement is linked to the proportionality concern. Some enforcement agents are reluctant to write up complaints against employers because they feel that the illegal workers are more severely punished than their employers.

Historically, employer sanctions were advocated by trade unions and progressive political parties because they made employers responsible for illegal employment that previously was punished by deportation and other penalties levied against the illegally employed alien alone. Particularly in the Paris area, a number of labor inspectors interviewed in the 1985-1987 period indicated that often they did not write up complaints for fear of putting marginal firms out of business. Or, they might locate four illegal alien employees but only charge the employer with hiring one. French labor inspectors enjoy a great deal of discretion. They need not write up citations if it is not in the public interest, which they are free to interpret.

In the South of France, particularly in the department of the Var, a movement developed in the ranks of labor inspectors against enforcement of employer sanctions. A group calling itself the antiracist collective distributed tracts and essentially argued that enforcement punished alien workers with deportation while their employers escaped punishment. This movement appeared localized. One of the com-plaints frequently heard in the Midi is that deportation of illegal alien workers prevents them from collecting the pay and employment-related benefits due to them under French law. This, coupled with the perception that employers will not be punished, appeared to prompt the protest. The proportionality concern, therefore, paradoxically appeared to affect enforcement in two ways: too heavy a fine against employers was seen by some French labor inspectors as a reason not to write up complaints; other inspectors claimed just the opposite as a reason for not writing up complaints.

A further problem affecting punishment of offending employers arises from their ability to adapt to enforcement strategies. Some employers have thwarted enforcement by going, as it were, deeper underground. This has been the case, for example, in the Paris area garment industry; some employers of aliens ineligible to work have relocated out of the garment industry center to more difficult to detect underground factories in the suburbs.

Another employer strategy has been to utilize subcontractors who hire illegal aliens. French authorities have revised their laws punishing illegal employment of aliens to facilitate punishment of the subcontractors and of firms that knowingly dissimulate illegal alien employment through subcontracting. The problem of subcontractors employ-ing aliens ineligible to work is particularly significant in the construc-tion industry. A number of recent studies of the construction industry in France have found widespread employ-

ment of illegal aliens through the subcontracting mechanism. The phenomenal growth of subcontracting in construction and service industries like cleaning and maintenance mitigates against successful enforcement of laws prohibiting illegal employment of aliens.

As underscored in the 1986-1987 report of the Interministry Liaison Mission to Combat Manpower Trafficking, the trend towards deregulation and greater flexibility in labor markets, as exem-plified by the growth of temporary worker agencies and eased regulations concerning employment of nonper-manent workers, tends to undercut governmental policies aimed at curbing illegal alien entry and employment. Employer sanctions are only one component of broader public policies affecting illegal migration. Labor market trends and developments in the 1980s generally mitigated against successful enforcement of laws prohibiting illegal alien employment.

IMPLICATIONS FOR ENFORCEMENT OF IRCA AND OTHER U.S. LABOR LAWS

The as-yet-unpublished French enforcement statistics for 1992 include 5,133 cases of illegal employment transmitted to prosecutors, with a total of 11,232 infractions; 1,457 or 13 percent of these cases involved illegal employment of aliens. In all, 8,130 persons were indicted, including 5,700 business managers. In 1991, 4,742 persons were convicted for illegal work; 27 percent of the convictions involved illegal alien employment; 25 percent of those convicted in 1991 were aliens from non-European Union countries. In 1993, 100 or so investigations by fiscal agents were conducted on the basis of cases written up in 1992. These investigations recovered 223,942,000 francs (roughly $45 million).

French officials also were upbeat about the implementation of the December 31,1992 law obligating employers to declare their intention to hire an employee prior to the onset of employment. By January 1995, more than 176,000 firms had made 1.2 million prior declarations to social security authorities before actual employment began. From September 1993 to December 1994, there were more than 18 million such prior declarations. These figures suggest that the experiment begun in 1992 conclusively had succeeded and that firms were complying voluntarily. This should further help prosecution of offending employers in court. Already, between 1988 and 1991, convictions for illegal employment progressed 90 percent. Bearing in mind that the appropriateness of governmental regulation of labor mar-

kets and the economy is generally viewed as less problematic in France than in the United States, there would appear to be much to learn from the French experience. Perhaps the most important lesson is that it takes years, even decades, to refine employer sanctions and related laws in order to make them more effective and credible. While there have been ups and downs and setbacks and advances in French enforcement, the French government clearly is doing more to prevent illegal immigration and illegal alien employment than it was one-quarter century ago.

Employer sanctions have not stopped illegal immigration to France and are unlikely to do so in the future. But presumably they do deter some illegal alien employment. They help confine it to certain industries and types of jobs. Many labor market developments in recent years adversely affected enforcement of employer sanctions, but the French government continues to adapt its strategy to changing circumstances.

The United States would do well to adopt the French and German approach of viewing illegal alien employment as but one aspect of a broader problem of illegal employment. This would tend to defuse the intense political opposition to employer sanctions enforcement in the United States that is unique among Western democracies. French enforce-ment history demonstrates that employer sanctions enforcement is not a threat to civil liberties or something that aggra-vates employment discrimination against minorities. To the contrary, legally resident and citizen minorities in particular have a great stake in effective enforcement of laws punishing illegal employment of aliens, as well as of other related labor laws.

France does not have a mandatory national identification document. But most French citizens, probably more than 95 percent, carry a national identity card. All aliens are required to carry appropriate identification. While there is concern over falsification of identify documents and safeguards have been instituted to prevent abuse of identity documents by authorities and others, the availability of more reliable identification in France is critical to French enforcement efforts. Particularly noteworthy is the growing ability of labor inspectors and social security agents to exchange information and coordinate their enforce-ment efforts with the assistance of computer-based research.

The challenge of preventing illegal immigration is long-term. Viewed from the perspective of the Western democracies, there are few hopeful signs on the horizon. Initiatives like NAFTA will produce desired results only over the long term.

Over the short to medium term, there is no alternative to enforce-ment of laws like IRCA. Indeed, it is likely that there will be mounting pressure from electorates for govern-ments to take more effective steps to prevent illegal migration. As Gary Freeman (1994) has suggested, a primary paradox in Western democracies in the late twentieth century is the lag and discrepancy between the average citizen's desire for immigration control and the reality of high levels of immigration, both legal and illegal.

Progress in regulation of international migration will come only incrementally and piecemeal. Employer sanctions were never viewed as a panacea for illegal immigration by French authorities but rather as a useful, indeed key and indispensable, measure in a broader strategy to control immigration.

For all the criticism of the Immigration Reform and Control Act of 1986 [IRCA] and enforcement of its employer sanctions provisions, IRCA made it illegal to hire unauthorized aliens. That was a major accomplishment, albeit one achieved at a high price given the subsequent administration of the Special Agricultural Worker [SAW] program. Now the imperative is to make employer sanctions work, to make them into a credible deterrent.

Ultimately, the battle for immigration control will be won or lost at the local level, in particular in industries and places of employment. The French model of department-level commissions bringing together concerned enforcement services, elected officials, and repre-sentatives of employers and employees is one that the United States could emulate. One of the initial effects of such statewide, countywide, or municipal commissions might be to put an end to blatant defiance and disrespect for the law by a number of municipal county and state authorities. Such commissions would tend to make local representatives more politically accountable for their immigration stands and this would serve American democracy well. Elected repre-sentatives would be less able to undermine and impede immigration control and then turn around and bill the federal government for failing to prevent illegal immigration.

More importantly, the creation of such commissions could be part of a repackaging of the immigration control issue as part of a broader problem—the growth of the underground economy and illegal employment practices in general. Opponents of immigration reform in the 1980s tended to portray enforcement of labor laws and the then hypothetical employer sanctions as a zero-sum game. The real-

ity, of course, is otherwise. Enforcement of employer sanctions complements enforcement of labor laws. Employers who violate immigration laws—whether in France or the United States—also are more prone to violate related labor law.

This reality makes improved interservice enforcement cooperation and coordi-nation a high priority. The recent agreement between the U.S. Department of Labor and The Immigration and Naturalization Service to allow labor inspectors to check I-9 compliance was a step towards the French approach. Much more can, and should, be done in this respect at all levels of government. The French began with local and regional experiments, initially in the Paris area, and then extended the departmental commission idea around the country.

The French government also has experimented with industrywide voluntary agreements. The idea is to get employers and employees in industries heavily affected by illegal alien employment to cooperate voluntarily in levelling the playing field as it were. Uncooperative firms and entrepreneurs might be barred from bidding for public contracts while cooperative firms would be favored. Especially in light of the Clinton administration's request that the newly-created World Trade Organization concern itself with labor conditions and standards, both France and the United States will need to take steps to ensure compliance with labor laws in order to make credible demands of others.

Democratic societies like the United States and France cannot balk before the complexities and cost of regulation of international migration. A great deal is at stake. Increasingly, the idiom of international migration—terms like "boat people," "asylum-seekers," "*non-refoulement*," and "guestworkers" once not in our vocabulary—has become the idiom of diplomacy and international relations. It no longer seems absurd to suggest that regulation of international migration looms as a principal foreign and domestic policy challenge for the twenty-first century.

The time actually is long overdue for scarce resources to be apportioned in a fashion commensurate with perceptions of threats. In the post-Cold War rethinking of foreign and national defense policies, regulation of international migration is assuming greater saliency. This bodes well for France and the United States as international migration policies for too long were not regarded as priorities. Enforcement of laws regulating inter-national migration is contingent upon political will. The capacity is there in France and, thanks to IRCA, increasingly in the United States.

Doubts persist, however, as to the political will to prevent illegal immigration in both countries. The task at hand is to erase those doubts through effective, credible action.

The progress made in France over the last two decades stems in no small part from the charge given to an interagency taskforce to monitor and report on enforcement, to propose reforms to make it more effective, and to facilitate interagency—including local and regional—cooperation. The United States should emulate the French interagency taskforce and mandate it to coordinate enforcement of all laws pertaining to illegal employment, not just illegal alien employment. Perhaps the Commission on Immigration Reform might fulfill this function. Moreover, the charge to this interagency entity should include research on the underground economy in general in order better to curb illegal alien employment in particular.

APPENDIX

Principal Steps in the Evolution of French Policy to Curb Illegal Alien Employment and the Underground Economy

DATE	MEASURE
July 11, 1972	Made illegal employment an indictable offense.
1972	Promulgated initial *ordonnances* concerning temporary work, trafficking of labor, and manpower leasing.
July, 1974	Suspended nonseasonal alien worker recruitment.
December 31, 1975	Adopted civil law regulating subcontracting in public and private markets.
1974-1976	Adopted laws that provide for the hiring of labor inspectors specializing in control of foreign labor in twenty-three "priority" departments.
July 10, 1976	Instituted a "special contribution" civil fine payable to the National Immigration Office for illegal employment of alien workers.
August 10, 1976	Created Interministry Mission to Combat Manpower Trafficking.
1980-1983	Completed four governmental studies of illegal work and the underground economy.
October 17/29, 1981	Passed new laws making illegal employment of aliens a more serious offense—a misdemeanor subject to police courts—and increased fines.

February 2, 1982	Institutued new *ordonnances* that reinforce regulation of manpower leasing.
August 31, 1983	Cabinet acted to reinforce policy against illegal alien migration and employment by: • Creation of fifty-five new positions for labor inspectors specializing in control of foreign labor; • Creation of department-level interagency committees to combat illegal alien migration and employment in twenty-three "priority" departments; • Creation of a branch office of the Interministry Liaison Mission to Combat Manpower Trafficking in Marseille; • Augmentation of the "special contribution" civil fine from 500 to 2,000 times the minimum hourly wage (30,200 francs as of January 1, 1990);
July 25, 1985	Made illegal work a misdemeanor.
January 16, 1986	Extended laws pertaining to illegal alien migration and employment to overseas departments.
March 14, 1986	Replaced by decree department-level interagency committees created August 31, 1983 with similar committees with a broader mandate to combat illegal work (the underground economy) in addition to illegal alien migration and employment .
January 27, 1987	Legally redefined illegal employment infraction. Simplified the definition of illegal work and broadened applicability.
July 21, 1988	Passed amnesty law that expressly excluded those punished for illegal work, illegal alien employment, and manpower trafficking and leasing.

January 13, 1989	Legally redefined an illegal employment infraction.
January 16, 1989	Extended by Interministerial decree the competency of the Interministry Liaison Mission to the underground economy.
July 10, 1989	Adopted new labor law that: • Newly incriminated illegal alien employment through intermediaries; • Redefined and more severely punished violation of the prohibition against reimbursement of fees paid to the International Migrations Office for foreign worker recruitment.
January 2, 1990	Amended Labor law that enabled officers of the Judiciary police, after court authorization, to enter workplaces on the presumption of illegal employment or illegal alien employment.
July 12, 1990	Modified labor code articles pertaining to subcontracting and leasing of labor: doubled fines for infractions to 8,000 to 40,000 francs; authorized unions to act on behalf of the workers involved.
July 25, 1990	Redefined by decre the role of department-level commissions.
November 8, 1990	Modulated by decree special contribution administrative fine for illegal alien employment: set the routine fine at 16,870 francs; doubled fine for employers who have been fined previously within the last five years; reduced fine for illegal alien employment without complementary violations if recommended by departmental authorities.
January 3, 1991	Legally extended authority to bring charges for illegal work infractions to social security and other enforcement agents.
April 18/22, 1991	Government granted employment authorization to Poles contingent on no adverse labor market effect.

September 26, 1991	Removed automatic work authorization for asylum seekers (as of October 1, 1991).
October 1, 1991	Facilitated by decree abrogation of short-term visas for aliens who work without authorization.
October 3/4, 1991	Government acted to facilitate recovery of social security payments due in illegal work cases.
October 30, 1991	Reinforced by decree the role of judicial authorities within departmental commissions and more fully associated socioprofessional representatives in department-level campaigns against illegal work.
December 31, 1991	Passed major new law overhauling and bringing together legislation concerning illegal employment.
January 24, 1992	Prime minister authorized departmental prefects (the chief governmental authority) to sign partnership agreements with unions and employer organizations to reduce illegal employment.
December 31, 1992	Instituted experimental requirement obligating all employers to declare their employment intentions prior to actual employment of an employee.
March 29, 1993	Authorized by decree social security organisms to use a national identification system to verify whether employers have complied with the obligation to declare all employees prior to the start of employment.

INTRODUCTION

Refugee resettlement is a diminishing, but continuing, part of the U.S. immigration pattern. In the last decade, the number of arriving refugees often exceeded 100,000 a year; only 75,000 are expected in FY '97.

The organizational pattern of refugee resettlement, often cobbled together under such emergency situations as the fall of Saigon in 1975, remains an administrative oddity. It is a combination of several federal entities, most, but not all, of the states, and a mix of quite different private, voluntary agencies.[1] Sometimes this amalgam works smoothly; sometimes it does not. Partially as a result of the design of the refugee resettlement program, and partially because of differing state standards regarding assistance to low- or no-income people, the *de facto* benefit packages for arriving refugees—and the financial costs to the states, counties, and the cities where they settle—range considerably.

There has been a remarkable change in the legislative mood about how, and how much, assistance should be made available to the poor. Both the recent Welfare Reform and Immigration Reform bills changed the rules drastically—but considerably less so for refugees than other groups of the foreign-born. Major efforts have been made to reduce the costs of assistance programs, particularly of "welfare" benefits for aliens.

Thus, options in resettlement exist within a triple context—lower refugee flows, a complex service delivery system, and legislative desires to reduce welfare expenditures. This paper explores current costs and it estimates costs under other models that might be considered in this context.

The paper first briefly describes how refugee resettlement is currently organized in the U.S. and how and why it might be changed. Second, it estimates: (1) the apparent financial costs of the current system, including federal costs now clearly recognized as being refugee-related; (2) federal costs that are not separately identified; and (3) major state and local government costs. Third it discusses different resettlement models—current and pro-

[1] Three types of nongovernment agencies are involved in refugee resettlement: (1) Department of State recognized voluntary agencies [volags] and their local affiliates that provide initial and continuing services to newly-arrived refugees; (2) mutual assistance associations [MAAs], self-help organizations usually organized around ethnic lines; and (3) other local service providers not associated with either the volags or MAAs.

posed—and their fiscal costs (primarily in the refugee's first year in the U.S.). These models use different constellations of agencies to deliver services. Some of these models, while probably costing society less in the middle- or long-term, have more *visible* costs, particularly in the short-term.

In any proposed reorganization of the refugee resettlement system, cost to the taxpayers is only one major factor. The real financial costs of the current system, or any alternatives, are murky. The estimates of financial costs—visible and invisible—to the federal and to state and local governments of the current refugee resettlement system and of five proposed alternative systems are primarily for the first twelve months—sometimes just the first eight months—of costs of refugees' first year in the U.S. even though long-term cost differences are, or at least could be, more striking.

Among resettlement system changes (not mutually exclusive) being discussed are giving more up-front financial responsibility to the federal government and restructuring the way resettlement and health services are delivered. Within this latter category, one suggestion is that private agencies do all resettlement work, another is that state and private refugee functions be reorganized, a third is replacing Refugee Medical Assistance [RMA] (a program of the Department of Health and Human Services [DHHS]) with Medicaid, another and larger DHHS program.

Some of these changes, it is argued, would result in lower first-year costs to the states, better (and more culturally-sensitive) services to refugees, less refugee welfare utilization, and smaller total governmental expenditures. Others suggest that proposed changes might remove state governments further from refugee work (eliminating or weakening the current network of state managers of refugee programs, called state refugee coordinators) and give an uneven assemblage of voluntary agencies [volags] the responsibility for distributing hundreds of millions in cash benefits—not the volags' forte in the past.

This paper does not evaluate these arguments and does not take a position on the social utility of the different resettlement models. It aims to provide useful background information on the cost structures of the various proposals and to provide cost estimates for six models:

> **Model A**, the current resettlement system (many of whose costs are not identified as such in federal reporting systems);

Model B, a Wilson-Fish Amendment-type program, based on the State of New York proposal that would take the resettlement program out of the welfare system (where it is currently lodged) but continue to use both RMA and Medicaid to deliver health services;

Model B-1, identical to Model B, but using only Medicaid to fund health services for refugees;

Model C, based on an extended experiment in San Diego County that would put all resettlement services in the hands of private, voluntary agencies, but would use both RMA and Medicaid;

Model C-1, identical to C, except that only Medicaid would be used to fund health services;

Model C-2, identical to C, except that most refugees would receive health services through the system now used for federal employees, except for SSI clients who would stay in Medicaid.

As **Chart 1**, a Summary Exhibit, indicates, the alternative scenarios would increase the visibility of refugee funding; some would increase substantially the federal share of the costs during the refugees' first year; all would reduce overall taxpayer costs; state costs would vary from model to model.

Estimates are that the costs of refugee resettlement, as defined, totalled $938.7 million in FY '95, while the costs for the various alternative models (for the same year) would have ranged from a high of $910.6 million to a low of $782.9 million. FY '95 was used for these models because some actual cost information is available and the numbers of arriving refugees, their demographic characteristics, and their distribution within the U.S. also are known.

A key variable, the extent to which alternative programs would reduce refugee assistance utilization, is an estimate based on work done and plans made in the two states where the costs of the refugee resettlement program are the highest: New York and California. Costs are high in these two states both because a large percentage of arriving refugees are resettled there and because their cash assistance benefits are relatively generous.

The alternative cost estimates in the paper were made in two steps. The first

* Visible costs are those clearly identified as related to refugees; invisible costs are not so identified; see text. Estimates are for first-year costs only, based on the arrival of 96,924 refugees that year; different arrival totals would, of course, affect program costs.

was to estimate, [see **Model A**] the actual costs of the current system.[2] The second step was to estimate costs after factoring in the advocates' arguments that restructuring would lower some costs [see **Models B, B-1, C, C-1** and **C-2**]. A series of detailed estimates include calculations for thirteen resettlement, health, and welfare programs. (Several other expenses, such as INS staffing, refugee travel loans, and the costs of education, were excluded from these calculations because the proposed shift in resettlement responsibilities would have no impact on these costs.)

Were any of these modifications to be implemented, there would be an additional complication, introduced by Welfare Reform. In the past, decreased utilization of cash assistance by low-income people generally—which was a very visible trend in the last couple of years—was evident for national budgetmaking. If changes in refugee resettlement cause a lower rate of refugee welfare utilization in the future, however, only some of the decrease would appear in federal calculations; the rest would simply ease the pressure on the block grants made to the states for the new Temporary Assistance to Needy Families [TANF] program that has replaced the previous federal welfare program of Aid to Families with Dependent children [AFDC].

HOW THE U.S. RESETTLES REFUGEES

Because public policy views refugees as victims of overseas oppression, as people who did not have the opportunity of planning and saving for international migration, and as people often scarred by their experiences, they are treated differently from other low-income aliens. Refugees are selected in a different manner and then given more services and much broader benefit packages than other aliens. Many agencies, public and private, are involved.

A macro decision—the Presidential Determination—is made about how many refugees will be resettled in the U.S. from various parts of the world, based largely on overseas considerations by the Department of State [DOS] in consultation with Congress. Within this context, overseas officers of the Immigration and Naturalization Service [INS] determine which in-

[2] As many refugee expenditures are not recorded *as such*, for example in most Aid to Families with Dependent Children [AFDC] and Medicaid programs, many of the numbers in this paper are (and must be) estimates.

dividuals qualify for admission as refugees.

Those so selected are given DOS travel loans, if needed, to pay for the air travel. Meanwhile, the names and profiles of the selected refugees are sent to New York City, where representatives of the volags decide where the refugees will be sent within the U.S. Refugees' desires regarding the resettlement location are given more weight than anything else in this process.

Each refugee is then assigned not only to a location, but also to one of the volags. The local affiliate of the volag meets the incoming refugee at the airport and makes immediate housing, social service, and medical screening arrangements for the refugee. These activities are funded by Reception and Placement [R&P] grants ($700 each in FY '95).

Those refugees who do not find work immediately—the majority—then are linked to services to help them meet their basic needs in the U.S. Some of these services (such as English as a Second Language [ESL] and job placement) sometimes are provided by the settling volag and sometimes by other agencies, including MAAs. In some instances, such as in the Matching Grant Program and in three Wilson-Fish programs [described below] efforts are made to keep the refugees away from mainstream assistance programs; in others, the refugees are signed up fairly quickly for cash and medical assistance and for Food Stamps, programs run by state and county welfare agencies.

Older and disabled people often file for Supplemental Security Income [SSI], a specialized cash assistance program run by the Social Security Administration [SSA]. Younger and nondisabled refugees are divided into two major groups for assistance purposes; those in families with children eighteen and under usually are eligible for what until recently was AFDC. Refugees not qualified for either SSI or AFDC (single adults and childless couples) are eligible for Refugee Cash Assistance [RCA] assuming, of course, that their incomes are low enough.

RCA, however, is available for only eight months. Refugee eligibility for AFDC and SSI, unlimited in time at the start of 1996, is now limited by the new welfare and immigration legislation; however, the ability to draw benefits is defined in both programs in terms of years, not months, and is affected by citizenship.

Historically, in states where benefits are at the generous end of the spectrum, AFDC offered some refugees an attractive alternative to immediate employment;

perhaps they could secure a better command of the English language or more education before venturing into the job market. Available data shows that most refugees are not fully supporting themselves two years after their arrival [see **Chart 13,** page 41 below].

It is the extensive utilization of welfare—partially supported by state funds—that helped stimulate some observers to design alternative resettlement models.

One set of models would retain both a state and private agency role, but take resettlement out of the welfare program that currently distributes assistance checks and provides some services. Another set of models would place all responsibilities on the volags.

The argument for the latter is that the frequent assignment of refugees to mainstream agencies that may not have either the linguistic or the cultural capacity to work with them leads to inadequate services or neglect. The volags, which have been with the refugees since the plane touched down, have more ability to help the refugees and often carry the "get a job" message more firmly—and in the refugee's own language—than state and county welfare system personnel.

This study focuses on the largest of the domestic government programs that work with refugees *and* on the costs of the first year of resettlement. It excludes the INS and DOS overseas costs of selecting refugees for resettlement in the U.S., costs incurred by local U.S. educational systems, such smaller segments of resettlement as the costs of the DOS and DHHS staff who run these programs, and the Department of Justice funding of the resettlement of Cuban-Haitian Entrants[3] (a relatively small program) because none of these costs would be seriously impacted by any of the proposed alternative systems.

The programs covered in this study are the twelve national or federal programs most directly involved with the resettlement and the health and welfare of the refugees [see **Chart 2**]. Also included—though the first-year costs are relatively minor—are the General Assistance (Home Relief in New York) programs that states and localities provide to indigent persons not eligible for AFDC, SSI or (in the case of refugees) RCA. Some refugees, when RCA expires, are supported by these programs, for which there are no federal funds.

[3] For years this program was lodged in the Community Relations Service; recently it was moved to INS.

Chart 2.
Refugee Resettlement: The Current System

PROGRAM	AGENCY	FUNCTION
FEDERAL		
Reception and Placement	DOS	Initial resettlement
Unaccompanied Minors	DHHS	Taking care of orphans
Targeted Assistance Grants [TAG]	DHHS	Social & employment services in impacted areas
Social Services	DHHS	Social & employment services
Matching Grant [MG]	DHHS	A resettlement program with some private funds
Refugee Cash Assistance [RCA]	DHHS	Cash assistance to refugees not eligible for SSI or AFDC
Refugee Medical Assistance [RMA]	DHHS	Medical services to non-AFDC, non-SSI refugees
State Administrative Costs	DHHS	State administrative costs for all DHHS ORR-funded programs
Food Stamps	USDA	Food Stamps
FEDERAL/STATE		
Supplemental Security Income [SSI]	SSA	Cash assistance for the disabled and aging
Medicaid	States	Medical services for low-income refugees not in RMA
AFDC [now TANF]	States	Cash assistance for low-income refugees not in RCA, MG, or SSI
STATE/LOCAL		
General Assistance (available only in some states)	State/Local Governments	Cash assistance for those ineligible for national and federal assistance programs listed above

.

CALCULATING THE COSTS OF THE CURRENT RESETTLEMENT SYSTEM

Statistical systems usually reflect the interests of their masters. Forms are written and data banks are designed to produce information managers regard as vital or at least useful; dates of birth and dollars spent are usually recorded; left-handedness, outside of baseball, is not. For such reasons, some government systems record refugee status and some do not; those that note the presence of refugees in their systems sometimes do not make much use of the data. Thus it is hard to track the costs of resettling refugees in this country. Ironically, sometimes the largest of the costs (e.g., those within the massive Medicaid and AFDC systems) are the hardest to measure.

The task is made more difficult by the just-described, decentralized, complex structures for helping refugees. Definitions of status and reporting periods vary; data on movements within the U.S. (secondary migration) are fragmentary; some refugees operate in the underground economy; many of the people who help refugees are more warm-hearted than computer-literate.

But before any rational discussion can be held on the best ways to improve the current system—to better serve refugees and to reduce or at least to contain costs—it is helpful to identify the current costs; hence the exercise, which includes equal part hard data and educated guesses, that follows. The techniques used to measure or estimate the more significant cost elements in refugee resettlement are described in detail below so that others can critique and, one hopes, improve on them.

The first-year cost estimates for the programs identified in **Chart 2**, are shown in Model A [**Chart 3**]. First-year estimates are used for several reasons: first, these are somewhat easier to quantify than the longer-term costs (which often get mixed in with programs for other Americans); second, much of the investment in refugees takes place during their first year in the U.S.; third, the overall direction of refugees' lives—towards self-sufficiency or long-term dependency—is largely determined in the first months in America.

For the sake of simplicity, calculations assume that all the refugees arrive on the first day of the fiscal year and that all the refugees have been here a full year at the end of that period. Similarly, I also assume that no refugees die in their first year in the U.S., that none return to their homelands, and that only 5 percent or so

have enough resources or enough good luck not to need help beyond the R&P period.

In each instance the sequence of the explanations below follows the order of the programs in these exhibits. Throughout "e" means the dollar figure is an estimate and "a" means an actual expenditure for FY '95.

Detailed Information on Model A Estimates

Reception and Placement. These are the initial expenses incurred by the volags as they help refugees on their arrival; DOS makes *per capita* grants to the limited number of volags involved in this work. The number shown is the number of arrivals that year, 96,924, multiplied by the R&P *per capita* grant of that year, $700. Would that the rest of the numbers in this paper were this straight-forward!

Unaccompanied Minors. There are always a relatively small number of unaccompanied minors (orphans in an earlier terminology) in any refugee situation. They are handled separately, with funding from ORR to the state child welfare agencies that oversee this work. The number shown is the annual expenditure for this population; it includes some funds for this year's arrivals and rather more for the young people who arrived in earlier years. We call these recurring costs. The number shown was secured by assuming that the ORR budget estimates for these costs for FY '96 ($22,861,000) and for FY '97 ($22,495,000) indicated a $23,000,000 actual for FY '95.

Targeted Assistance Grants. These are ORR funds used to support employment and other assistance programs in areas with concentrations of refugees. Some of the funds are distributed on a formula basis and some in a discretionary manner. The number shown is a FY '95 actual.

Social Services Funds. These are also ORR moneys used for employment and related services and are distributed mostly on a formula basis through the states, but up to 15 percent is awarded as discretionary grants. The total is also a FY '95 actual.

Matching Grant Program. This is an ongoing ORR program. During FY '95 it provided volags with $1,000 grants per refugee when the volags produced, on average, an equal or larger amount of money (and/or goods and services) to help the

refugee resettle. These combined funds were then used, among other things, to support the refugees for four months without recourse to the mainstream welfare program.

ORR provided $1,000 grants to resettle 23,567 refugees in CY '95, hence the $23.6 million federal figure, used here for the fiscal year. While some agencies, notably those affiliated with the Hebrew Immigrant Aid Society [HIAS], overmatched the $1,000 figure, others did not. In these calculations I have used the amount of the mandatory match ($23.6 million), rather than estimating the actual total of these matches. This, as well as not noting the substantial contributions that many of the volags make to the R&P process, understates the role played by private contributions, but this analysis assumes that these contributions would not be impacted by a reorganization of the resettlement process.

Refugee Cash Assistance. This is an actual FY '95 expenditure.

Refugee Medical Assistance. This is also a FY '95 actual.

State Administrative Costs. These are the state's costs for operating RCA, RMA, the state refugee coordinators' offices, and other refugee programs. In some cases, where public assistance is administered through counties, this line item also covers the counties' costs in managing these programs. Again, this is a FY '95 actual.

Food Stamps. While some volags seek to avoid placing refugees on cash assistance, none to my knowledge discourage the use of the Food Stamp program that helps low-income people whether they are on assistance or are among the working poor. This estimate is constructed from: (1) the number of arrivals in FY '95 (96,924); (2) an educated guess about an average midyear utilization factor of 80 percent (higher at the start of the period, lower at the end); and (3) the average individual's Food Stamp benefit of $828.00 per year for 1994.[4]

SSI. The Social Security Administration ran a special tabulation for the Commission[5] showing the number of new SSI awards made to refugees in CY '95, 22,780 in all. From this total, and using a series of other data and

[4] Calculated from *Statistical Abstract of the U.S. 1995*, Table 613.

[5] For which I am grateful to Charles Scott and Elsa Ponce of the Office of Research, Statistics and Evaluation of the Social Security Administration.

Chart 4.
Annual Additional Cost of SSI Payments to Refugees/Asylees; Payments to New Enrollees, CY '95

CATEGORIES	APPLICATIONS (column 1)	AWARDS (column 2)	ESTIMATED TOTAL BENEFITS FOR THE YEAR (column 3)
Aged	8,400	7,530	$ 43,301,000
Blind and Disabled	20,570	15,250	$ 87,694,000
Total	**28,970**	**22,780**	**$130,995,000**
Processing delay factor [see below] x .75			$ 98,246,000
Average monthly payment (Federal and State)			$ 479.20

Source: **Columns 1** and **2**: unpublished data from SSA, Office of Research, Evaluation, and Statistics obtained from SSI 10-percent files of 1995; **Column 3**, benefit totals calculations by the author based on $479.20 figure at the bottom of column, which comes from: Ponce, Elsa. 1996. "Lawfully Resident Aliens Who Receive SSI Payments, December 1995." Office of Program Benefit Payments, SSA (February 1996) Table 11. Assuming a three-month average processing time for SSI, the first year's benefit total has been reduced by 25 percent.

The monthly benefit figure shown is the average for the SSA category of "Color of Law Aliens," most of whom are refugees; a few asylees and others are included as well. The other SSA alien category, "Lawfully Admitted Aliens," covers those arriving in the nation as immigrants; the average monthly benefit for that group is $400.83. All data are for federally administered payments; a few state-managed state supplementation checks are outside this system.

Note: The $130,995,000 estimated here is a *recurring* cost that will persist for years, dwindling over time as the enrollees die. Many other costs in this study (e.g. RCA) are short-term costs only.
SSA does not record the year of arrival of aliens; one year's cohort of new awardees thus includes some persons arriving in the year of the award and some in earlier years; alternatively, some aliens arriving in CY 1995 will apply for benefits in future years; at a time of steady arrivals, these factors balance. The 1995 arrivals, 96,924, were about equal to the average of the arrivals in the ten prior years, 99,490. If refugee arrivals decline in the future, the number of refugees applying for SSI would decline, too, but more slowly than the decline in arrivals.

assumptions spelled out in **Chart 4**, I calculated that the new SSI awards made to arriving refugees that year would come to $130,995,000 a year on an annual basis. This would be a recurring cost for as long as the SSI beneficiaries survived (about one third were aged, the others were disabled or blind.)

As, however, there is a multimonth application process (during which newly-arrived refugees often use RCA or their family's AFDC grants) and as the Commission is interested in first-year costs, I factored in a three-month waiting period and reduced the total amount of costs in this program (for this first year) by 25 percent.

SSI is largely, but not exclusively, a national program. Some of the states that have higher AFDC payments also supplement the national SSI payment; California is particularly notworthy in doing this.

The Social Security Administration, however, apparently to avoid attracting the attention of migratory benefit shoppers, publishes no data on this state-by-state variable. Informally I was told that a 15 percent state supplement would be a safe guess, particularly with a population that included many Californians and New Yorkers, and so I used a 85 percent federal/15 percent state ratio in the various models.

Medicaid. Refugees who are eligible for AFDC or SSI on arrival are also eligible for Medicaid. Refugees who are eligible for RCA are covered by RMA. RCA Refugees covered by the Matching Grant program also are routinely covered by RMA.

Thus, to estimate the Medicaid cost, it was necessary to calculate what percentage of the incoming population was eligible for AFDC and SSI and then multiply that combined population by a plausible unit cost.

Thanks to DOS and its contractor, the Refugee Data Center, I was able to obtain a printout on all refugees arriving in June, 1996; various knowledgeable people assured me that the 6,054 refugees arriving that month represented a good sample of refugee cohorts in the last few years.

I then examined the demographic characteristics of each arriving refugee (largely date of birth and family membership) and assigned all arrivals to three eligibility categories: RCA; AFDC; and SSI (as spelled out at the

bottom of **Chart 5**). Clearly not all those eligible for these programs used them, but the exercise gave a sense of the sizes of these three populations: 59 percent AFDC; 33 percent RCA; and 8 percent SSI. (This system probably slightly overstates the AFDC percentage and slightly understates the RCA percentage as a few states (such as Colorado) classify intact refugee families into the RCA program rather than into AFDC.)[5]

The SSI and AFDC eligibles thus came to 67 percent of the arrivals; this was multiplied by a 90 percent Medicaid usage estimate to secure an estimated FY '95 refugee Medicaid utilization population of 55,445.

For a Medicaid unit cost in FY '95, I used $3,294 a year; this is the 1993 average cost of Medicaid[6] increased by 6 percent for inflation. This Medicaid estimate, for twelve months, of $3,294 compares with the FY '96 ORR budget estimate of $3,592 for eight months of RMA, and thus my estimate may be on the conservative side.[7]

These two unit costs may, on the other hand, simply indicate that RMA is a more costly way to provide health services than Medicaid.

The math for this is one of the more heroic estimates: 1995 arrivals of 96,924 x 67 percent (AFDC + SSI eligibles) x 90 percent utilization = 55,445 x $3,294 = $192.5 million (rounded).

To divide the costs between the federal and the state governments, I used the Health Care Financing Administration [HCFA] rule-of-thumb for national calculations of 55 percent federal, 45 percent state. There is a sliding scale formula tilted in favor of the low-income states, but the 55/45 ratio works on national estimates. In this case it is $108.8 million federal, $83.7 million state.

---

[5] For an explanation of why Colorado, and a few other states, handle this situation in this manner, see Appendix C.

[6] Calculated from *Statistical Abstract of the United States 1995*, Table 163.

[7] There is a nuance in the funding of medical care for refugees in their first months in the U.S. that supports the notion that the costs of the eight-month period of RMA may exceed the twelve-month costs of Medicaid for similar populations. Many states use RMA funds to finance, or help finance, the initial, domestic health screening of newly-arrived refugees, and thus RMA funds are used for both RMA- and Medicaid-eligible refugees. This pattern was discussed at the conference on refugee health held by ORR in Washington in September, 1996.

AFDC. This estimate is based on an adjustment to the ORR actuals for RCA expenditures during FY '95, of $55,947,645; as there were (in the June 1996 sample population) 178 AFDC eligibles for every 100 RCA eligibles, I multiplied the RCA expenditures by 1.78, and then multiplied the product by 1.4. The use of 1.4 was needed because, while RCA benefits can be paid for no more than eight months, AFDC payments can be paid for the full year. However, later in the period, cash assistance begins to decline, so instead of using a factor of 1.5 (the relation between 12 and 8) I used 1.4. This works out as follows: $55,947,645 (RCA actual) x 1.78 (AFDC/RCA eligible ratio) x 1.4 (time factor) = $139.4 million (rounded).[8]

To divide the costs between federal and state governments, I used a 54 percent-46 percent ratio calculated from an Office of Family Assistance Report.[9] Thus it is $75.3 federal million and $64.1 million state.

General Assistance [GA]. This is a state-and-local-government-only program that provides limited cash assistance to nonelderly, non-disabled, nonparents, i.e., to those who do not qualify for either AFDC or SSI. A refugee leaving RCA and not able to find a job would qualify in the state such as California and New York (where it is known as Home Relief) that offer this program).

For those states that have GA programs, the state's exposure to these costs, as far as refugees are concerned, does not begin until the end of the eighth month, so state exposure in the *first* year is limited, but may grow rapidly in later years if GA clients do not secure jobs.

The $3.2 million estimate is based on the assumptions that half the arrivals will come to states without General Assistance programs (e.g., Texas), that 33 percent of that half will be RCA eligible, and that after the eight months half of them will apply for General Assistance, which will be paid to them at the rate of $100 a month. Again, some heroic assumptions, but (in the first year) the costs are

[8] An effort was made to collect state data on refugee utilization of AFDC and Medicaid; most states, however, do not keep data on this variable as the DHHS does not require the states to identify refugees in these programs. Some information was secured, however; this is discussed in Appendix C.

Source: Refugee Arrivals by City/State for June, 1996; prepared by the Refugee Data Center (New York, NY) for the Bureau for Population, Refugees, and Migration, Department of State.

Note: Chart shows *potential* eligibility of the arriving refugee population for the three principal sources of cash assistance available to them: AFDC; RCA; SSI; not shown is the *utilization* of these programs.

The birth years of the arriving refugees and apparent family composition were used as a rough measure of program eligibility. Those born in or before 1931 were placed in the SSI column, children born in or after 1979 and those appearing to be their parent(s) in the AFDC column; all others in the RCA column. RCA eligibles included many in the Matching Grant program. No effort was made to estimate the number of disabled SSI claimants, who presumably use AFDC or RCA while in the process of seeking those SSI benefits. Included in the state and national totals, but not in the three columns of welfare eligibility, are 54 unaccompanied minors.

The average case size was derived by dividing the total number of arriving refugees by the number of cases reported.

minimal; they might triple, however, in subsequent years. The math is as follows: 96,924 arrivals x .5 (presence/absence of GA) = 48,462 x .33 (RCA eligible) = 16,152 x .5 (GA usage rate) = 8,076 (users) x 4 months x $100 per month = $3.2 million (rounded).

As a result of all of these calculations, the estimate of the total federal, state, local and private costs of resettling the 96,924 new refugees is $938.7 million for FY '95. This covers, as stated earlier, the costs of the stipulated programs.

What would these costs have looked like—again, for these programs—had alternative scenarios been in place during FY '95? That is the next subject.

CALCULATING THE RELATIVE COSTS OF THE ALTERNATIVE SCENARIOS

Some of the first-year costs of refugee resettlement potentially are susceptible to change under the discussed alternative systems; some are not. What these systems arguably could do would be to decrease cash assistance utilization over time. This also would have effects, but lesser ones, on both health care and administrative costs. The effects on Medicaid would be lesser because medical assistance programs include among their beneficiaries some members of the working poor even after they have left cash assistance.

None of the alternative scenarios, however, would do anything to the size of R&P grants, for example. For a program-by-program checklist of what the alternative scenarios could and could not do, see **Chart 6**. [These are the judgements of the author; others might come to different conclusions.]

Five alternative scenarios are outlined below.

1. Model B

Model B [**Chart 7**] is based roughly on a New York State proposal under the Wilson-Fish Amendment. While I have not seen a text of that proposal, its central feature is that the new program would decrease taxpayer costs by 5 percent over the first two years that refugees are in the country. The proposal currently is the subject of negotiations between the City and the State of New York, both of which must sign off on it prior to implementation.

Chart 6.
Refugee Resettlement: Likelihood of the Described Alternative Scenarios Reducing Governmental Costs

PROGRAM	AGENCY	LIKELIHOOD OF CHANGE
FEDERAL		
Reception and Placement	DOS	None
Unaccompanied Minors	DHHS	None
Targeted Assistance Grants [TAG]	DHHS	Unlikely, employemnt services will still be needed
Social Services	DHHS	See line above
Matching Grant [MG]	DHHS	Limited
Refugee Cash Assistance [RCA]	DHHS	Some reduction is likely, but current 8-month cut-off limits the extent of reduction
State Administrative Costs	DHHS	Use of Medicaid instread of RMA would proably reduce cotsts, perhaps substantially
Food Stamps	USDA	Minimal, as program helps the working poor as well as those on cash assistance
FEDERAL/STATE		
Supplemental Security Income [SSI]	SSA	None, employment highly unlikely for SSI recipeints
Medicaid	States	Some reduction the first year, more in later years
AFDC [Now TANF]	States	Some reduction the first year, more in later years
STATE/LOCAL General Assistance (available only in some states)	State/Local Governments	Minimal reductions in first year, substantial ones later

Note: These are the author's judgements and relate, generally, to the alternative models described in the text.

Chart 7. Model B
Estimated Costs of a New York-Style Modification of a U.S.-funded Program Using Both RMA and Medicaid as Is the Current Practice
(for new refugee arrivals during FY 1995)

PROGRAM	AGENCY	ESTIMATED COSTS ($ MILLIONS)	
FEDERAL			
Reception and Placement DOS	Federal	$ 67.8[a]	
Unaccompanied Minors	DHHS	Federal	$ 23.0[e]
Targeted Assistance Grants [TAG]	DHHS	Federal	$ 44.5[a]
Social Services	DHHS	Federal	$ 80.8[a]
Matching Grant [MG]	DHHS	Federal	$ 22.4[e]
		Private	$ 22.4[e,c]
Refugee Cash Assistance [RCA] (8 mos.) + AFDC (12 mos.)	DHHS	Federal	$185.5[e]
Refugee Medical Assistance [RMA] (8 mos.) + Medicaid (12 mos.)	DHHS	Federal	$273.8[e]
Admin. Costs	DHHS	Federal	$ 25.0[e]
Food Stamps	USDA	Federal	$ 64.2[e]
FEDERAL/STATE			
Supplemental Security Income [SSI]	SSA	Federal	$ 83.5[e]
		State	$ 14.7[e]
Medicaid (12 mos., for AFDC, SSI & GA clients)	States	[covered in RMA line]	
AFDC (now TANF) (12 mos.)	States	[covered in RCA line]	
STATE/LOCAL			
General Assistance (available only in some states)	State/Local Governments	State/Local Governments	$ 3.0[e]
Total Costs		Federal	$870.5[e]
		State	$ 17.7[e]
		Private	$ 22.4[e]
		Total	**$910.6**[e]
Per capita, for FY '95 arrivals (96,924)			**$9,395**[e]

Notes: Most cost estimates are based on the N.Y. Wilson-Fish proposal, calling for a five percent reduction in specified programs for refugees [see text]. See model A for key to symbols [a, e, c.]

In a version of this basic model used in this paper the reductions are calculated as creating 5 percent savings in the first year for the following programs: RCA, RMA, AFDC, Medicaid, GA, Matching Grant and administrative costs.[10] Most of these specified costs currently are paid by the federal government, but others (including AFDC, Medicaid and GA) include state and local costs. The proposed program is *not* expected to reduce expenditures in some other areas, such as R&P and SSI.

Further, in Model B, the federal government would fund all cash assistance costs for RCA and RMA clients during the first eight months and all costs of AFDC and Medicaid for the first twelve months.

The estimate for Model B is that all nationwide costs of the specified resettlement programs would have been $910.6 million, were this program in effect nationally in FY '95. This would have been a savings of about $28 million compared to this paper's estimates of the real costs of the specified resettlement programs in that year [**Chart 6**, Model A].

Model B would reduce states' first-year costs dramatically, from $165.7 million (in Model A) to $17.7 million, and increase federal costs by about $120 million.

It should be stressed that these are the author's calculations based on the formula described above, and are *not* estimates generated by the State of New York or the volags working there. Nor are these estimates (as opposed to those for Models C, C-1, and C-2) based—in part—on actual experience.

The projected cost savings are based on the assumption that a cooperative state-private program mounted outside the welfare system would bring about more rapid employment among the refugees and would reduce fraud caused by simultaneous receipt of cash benefits and underground wages. The notion is that a refugee-specific program, with major inputs from the voluntary agencies, would be based on closer case management and more finely-tuned employment counseling than found in the current system.

It appears that these benefits—and some administrative savings—easily could lead to the promised reduction of at least 5 percent.

2. Model B-1

Model B-1 [**Chart 8**] is identical to Model B except that health services would be handled differently. Model B would con-

Chart 8. Model B-1
Estimated Costs of a New York-Style Modification of a U.S.-funded Program Using Medicaid Only for Health Services Instead of Medicaid + RMA

(for new refugee arrivals during FY 1995)

PROGRAM	AGENCY	ESTIMATED COSTS ($ MILLIONS)	
FEDERAL			
Reception and Placement	DOS	Federal	$ 67.8[a]
Unaccompanied Minors	DHHS	Federal	$ 23.0[e]
Targeted Assistance Grants [TAG]	DHHS	Federal	$ 44.5[a]
Social Services	DHHS	Federal	$ 80.8[a]

Food Stamps	USDA	Federal	$ 64.2[e]
FEDERAL/STATE			
Supplemental Security Income [SSI]	SSA	Federal	$ 83.5[e]
		State	$ 14.7[e]
Medicaid (12 mos., for AFDC, SSI & GA clients; 8 mos. for RCA clients)	States	Federal	$140.6[e]
		State	$115.1[e]
AFDC [now TANF] (12 mos.)	States	[covered in RCA line]	
STATE/LOCAL			
General Assistance (available only in some states)	State/Local Governments	State/Local Governments	$ 3.0[e]
Total Costs		Federal	$737.3[e]
		State	$132.8[e]
		Private	$ 22.4[e]
		Total	**$892.5**[e]
Per capita, for FY '95 arrivals (96,924)			**$9,208**[e]

Note: Estimated costs are the same as in Model B, except that Medicaid unit costs have been substituted for RMA actual expenditures. See note for Model A for a key to the symbols [a, e, c].

tinue to use the current system, RMA for some and Medicaid for other refugees, with the Federal government covering all health costs in the first year. Model B-l would place all health services in the Medicaid system, with funding from both Federal and state sources.

As noted earlier, Medicaid costs less—for reasons that are not totally clear—per person than RMA. Medicaid is a much larger program, and there may be economies of scale at work. As noted earlier, initial health screenings for Medicaid-covered refugees appear as RMA costs.

The estimate in Model B-1 is that the total costs of medical assistance, nationwide, during the first year would be $255.7 million. If the usual HCFA formula applies (55 percent U.S./45 percent states), this would work out to $140.6 million in federal costs and $115.1 million in state costs.

The $255.7 estimate is worked out in the following manner: first, there is the estimate (from Model A) that Medicaid costs in FY '95 were $192.5 million for first-year refugees being served by this program. To this is added $63.2 million as the estimate of what it would have cost in FY '95 to provide health services via Medicaid rather than RMA ($192.5 + $63.2 = $255.7).

The $63.2 million, in turn, is based on: the previously-cited unit cost for Medicaid for a year ($3,294) times two-thirds (for eight months out of twelve) times an assumption that 33 percent of the arriving cohort of 96,924 (or 31,985) is RMA- (and RCA-) eligible, and that all but 10 percent of them will use medical services. Stated in another way: $3,294 x .667 x 31,985 x .90 = $63,246,761.

This is then rounded to $63.2 million. In contrast, RMA actual costs in FY '95 were $95.7 million.

The total costs of Model B-1 come to $892.5, lower than the costs for either Model A ($938.7 million) or Model B ($910.6). Both federal and state costs would be below those of Model A; most of the savings between Models A and B-1 would fall to the states, about $33 million, as opposed to federal savings, estimated at about $12 million.

The San Diego Experience

Before describing the estimates for Models C, C-1, and C-2, it would be useful to review the experience of alternative refugee resettlement programs, ones that are not run through the welfare system. What does research show on this subject? As

usual, not as much as one might want, but there are some useful informational building blocks.

First, there is strong statistical evidence gathered over the years *within the welfare system* that cash assistance utilization is lower in jurisdictions that have lower benefit checks than in those with higher ones; this is the case for both refugee and nonrefugee populations. This suggests that factors—in fact, government-determined factors—external to the refugees, and to their traditions and cultures, can play a role in the dependence-independence equation.[11]

A somewhat similar precedent regarding a neglected relationship between governmental policy and use of welfare can be seen in the comparison between the Food Stamp utilization rates of refugees and asylees noted in **Appendix D**.

Asylee utilization rates are considerably below those of refugees, although both have equal legal access to benefit programs; asylees are not greeted on their arrival with the supportive programs that exist for refugees; they typically have recourse to only one source of income—unauthorized employment. (Asylum applicants cannot work legally until the passage of six months—or earlier if asylum is granted.)

Appendix D also notes that there are some demographic as well as programmatic differences between these populations, i.e., a higher proportion of working-age males among asylees than among refugees.

Second, there is some evidence *outside the welfare system* that the Matching Grant [MG] program, which keeps refugees out of the welfare system for their first four months in the country, does well by most of its clients. ORR data show that during CY '95 40.9 percent of MG clients were self-sufficient at the end of the four months.

In contrast, earlier ORR data, dealing with all refugees in the nation for five years or less, found that only 30.5 percent were self-sufficient [see **Chart 13, page 41**]. The MG program, working with a much more recently-arrived population, had more self-sufficiency at the end of four months than the broader population, even though,

[11] The last ORR report offering information on this variable, *Report to the Congress: Refugee Resettlement Program*, Dec. 31, 1989, pp. 41-42, showed dependency rates, after two years, of 10-11 percent in North Carolina and Louisiana, for example, compared to 69 percent in Wisconsin and Minnesota.

on average, the latter group had been in the nation for two and one-half years.

Matching Grant is a major program, with 25,767 individuals completing their four-month programs during CY '95.[12] Thus systems like Matching Grant apparently can make a difference.

Third, and most on target, there is evidence *both inside and outside the welfare system* that the Wilson-Fish program operated by U.S. Catholic Charities [USCC] has made a major difference in welfare utilization in a difficult environment—California—which has had one of the most generous state welfare systems.

Briefly, USCC, through its affiliate, Catholic Charities, has been running for six years an experimental program resettling RCA refugees in San Diego County. Robert Moser, a social scientist, is the program director and he has data not only on its own clientele (the study group), but on a comparable control group as well; the former are the RCA refugees served by USCC, and the latter are RCA refugees served along traditional lines, by the San Diego County Department of Social Services.

The study group is subject to concerted case management, with project staffers providing reception and placement services, social and employment services, direct cash assistance (the same formula as for other refugees but without contact with the welfare system), and, if need be, sanctions. Everything is done within a single organization, and refugees are encouraged at every turn to get a job; there is no opportunity for clients to play off one organization against another, nor to be influenced (to put it bluntly) by the habits of some of the longtime welfare users.[13]

The San Diego program is a major project, which dealt with 918 refugees (as opposed to 1,209 refugees in the control group) between September 1990 and March 1994. A major neutral data source has been

[12] Unpublished data on the Matching Grant Program, received from ORR in October, 1996.

[13] Congressmen David Obey (WI) and Gary Condit (CA) both testified in favor of a resettlement program that would have many of the characteristics of the San Diego program and a House of Representatives Immigration Subcommittee hearing on August 1, 1996. Obey's proposal, not yet shaped into bill form, would turn over all resettlement activities to the voluntary agencies and would provide for full federal funding during refugees' first twelve months in the U.S. Models C and C-1 are close to the Obey proposal, but each provides federal cash and medical assistance to non-AFDC refugees for eight month, not the twelve suggested by Obey.

tapped; this consists of the forms filed with INS by refugees at the end of their first year in this country. These are the I-643s; their principal purpose is to document the applicant's transition from refugee to permanent resident alien status; Dr. Moser has used the one line on the form that asks if the refugee has a job to measure the employment status of the control and experimental groups. The percent currently employed at the time of the filing of the form for the two populations were: USCC experimental group 55 percent; San Diego control group 42 percent.[14]

Dr. Moser reports that in more recent months the percentage of USCC clients with jobs has increased to 60 percent. Using the earlier data, the rate of employment (and presumably self-sufficiency) is 24 percent higher for the experimental group than for the control group, i.e., 42 is 76 percent of 55.

Another measure of welfare utilization reduction, pulled from the same set of I-643 data, relates to the number of months of RCA utilization. Assuming no significant difference can occur in the first month, Dr. Moser notes that in the following seven months the experimental group used 4.67 months of RCA while the control group used 7 months of it, a 33 percent reduction for the experimental group.[15]

While it would be very helpful if there were other careful comparison studies of privatization programs vis-a-vis the mainstream refugee resettlement programs, this one is encouraging enough, large enough, and structured enough for careful consideration. [For a note on the other two USCC Wilson-Fish programs, those in Nevada and Kentucky, see **Appendix B**.]

For the purposes of this analysis, the 24 percent higher incidence of employment and the 33 percent reduction in RCA utilization will be averaged as a 28 percent reduction in cash assistance *in California-type situations.*

This is not to suggest, however, that the introduction of a San Diego-style scenario, even if it proved to be equally successful nationwide, would have the same cost-cutting effect in say, Texas, as it does in California. The alternative scenario pre-

[14] "Final Program Progress Report, Sept. 1, 1990 - August 31, 1994" U.S. Catholic Conference/Migration & Refugee Services, San Diego Wilson-Fish Demonstration Project, ORR Grant No. 902WF-DC001/90RD0005/01. An ORR-funded evaluation of the multiyear project is expected early in 1997.

[15] Personal fax from Dr. Moser, Nov. 15, 1996.

sumably would make little difference in the really low-benefit states, where the modest size of the checks drives all able-bodied people immediately into the job market.[16]

The next question then is: How do we weigh the national significance of the USCC's apparent success in California? Is California such an outlier in terms of benefit amounts, that the San Diego experiment can have no replicability outside that state?

To obtain an answer, without having access to actual state-by-state RCA expenditures, I used two other data sets: average monthly AFDC benefits for a family in FY '93, and the size of the arriving refugee populations in June 1996. **Chart 9** shows the construction of a proxy measure for actual RCA expenditures; three classes of states were created on the basis of the dimensions of the typical AFDC benefit, and a median benefit amount for each class was multiplied by the number of June arrivals in those groups of states. This suggests that about 64 percent of the RCA and AFDC funds for refugees was spent in the nine most generous states; 21 percent in the next band of (16) states, and 15 percent in the twelve states in the lowest band. (The other thirteen states had too few arrivals—less than ten each that month—to be considered usefully in the exercise.)

As something like 64 percent of the refugee cash assistance dollars was going to states like California and 36 percent was going elsewhere, I deflated the San Diego percentage (28 percent) by a factor of 25 percent before applying it nationally, i.e., if the privatization program could reduce cash utilization by 28 percent in California, it would be able to reduce it by about 21 percent nationwide.

While this may be a heroic estimate, it is also a modest one. Given dependence rates that have sometimes reached 90 percent or more among certain refugee communities, a 21 percent reduction of the use of cash assistance during the first year is not unreasonable.

3. Model C

Model C [**Chart 10**], then, is similar to Model B except that it uses the San Diego experience with RCA—a reduction in the first year of 21 percent—instead of the 5

[16] One policy option that I have not seen discussed would be to privatize the refugee program in the high-benefit states and leave it alone in the low-benefit states on the grounds that benefit levels alone were forcing people into employment.

Chart 9:
Distribution of Arriving Refugees vis-a-vis AFDC Benefit Rates

(June '96 arrivals, '93 AFDC Monthly Benefits, Selected States)

HIGH BENEFIT STATES ($401+ monthly per family)
CA, CT, MA, MI, MN, NH, NY, WA, WI

Arrivals	2,949
Median Benefit	x $581
Product (proxy for refugee costs)	$1,477,449

MEDIUM BENEFIT STATES ($301 - $400)
AZ, CO, DC, IA, ID, IL, KS, MD, NB, ND, NJ, NM, OH, PA, OR, UT,

Arrivals	1,452
Median Benefit	x $335
Product (proxy for refugee costs)	$486,420

LOW BENEFIT STATES ($300 and less)
FL, GA, KY, IN, LA, MO, NC, NV, SC, SD, TN, TX

Arrivals	1,478
Median Benefit	x $235
Product (proxy for refugee costs)	$347,330

TOTALS BY CATEGORY

Proxies for High-Benefit States	1,447,449	64%
Proxies for Medium-Benefit States	486,420	21%
Proxies for Low-Benefit States	347,330	15%
Total	$2,281,207	100%

Note: In the absence of RCA state-by-state actuals, this calculation shows the relative financial significance of changes in welfare utilization in high-benefit states; more money is saved if utilization is reduced where the benefits are the highest.

Sources: Arrival data is from Chart 5 (for June 1996) and benefit rates are from *Statistical Abstract of the United States 1995*, Table 612. To eliminate statistical distractions, the two states with the lowest AFDC benefit rates (MS and AL) and the two with the highest (AK, HI) were eliminated; none of these four states settles a significant number of refugees. Similarly, other states with fewer than ten arrivals in June 1996 also were dropped.

Chart 10. Model C
Estimated Costs of a San Diego-Style Modification of a U.S.-funded Program Using Both RMA and Medicaid as Is the Current Practice

(for new refugee arrivals during FY 1995)

PROGRAM	AGENCY	ESTIMATED COSTS ($ MILLIONS)	
FEDERAL			
Reception and Placement	DOS	Federal	$ 67.8[a]
Unaccompanied Minors	DHHS	Federal	$ 23.0[e]
Targeted Assistance Grants [TAG]	DHHS	Federal	$ 44.5[a]
Social Services	DHHS	Federal	$ 80.8[a]
MG Program	DHHS	[no separate program]	
Refugee Cash Assistance [RCA] (8 mos.) + AFDC (12 mos.)	DHHS	Federal	$199.0[e]
Refugee Medical Assistance [RMA] (8 mos.) + Medicaid (12 mos.)	DHHS	Federal	$273.8[e]
Admin. Costs	DHHS	Federal	$ 25.0[e]
Food Stamps	USDA	Federal	$ 64.2[e]
FEDERAL/STATE			
Supplemental Security Income [SSI]	SSA	Federal	$ 83.5[e]
		State	$ 14.7[e]
Medicaid (12 mos., for AFDC, SSI & GA clients)	States	[covered in RMA line]	
AFDC [now TANF] (12 mos.)	States	[covered in RCA line]	
STATE/LOCAL			
General Assistance (available only in some states)	State/Local Governments	State/Local Governments	$ 3.0[e]
Total Costs		Federal	$861.6[e]
		State	$ 17.7[e]
		Total	**$879.3[e]**
Per capita, for FY '95 arrivals (96,924)			$9,072[e]

Note: Most cost estimates are the same as in Model B, but there is no Matching Grant program and the San Diego experience with reducing the use of RCA is used in this model. Also, [a] actual expenditures and [e] estimates.

percent used in Model B; further, C like B has federal funds for health care the first year.

Additionally, Model C, as it would operate totally within the private resettlement operation, eliminates the Matching Grant program as a separate entity; the $22.4 million in federal funds used in this program (largely for RCA-like grants) have been added into the combined RCA-AFDC line in Models C, C-1, and C-2. (Private funds are dropped from the formula, but it is likely that some of these resources would continue to be available for refugees.)

While USCC has had some limited, and encouraging, experience with AFDC clients in San Diego County, the calculations for reductions in AFDC spending in Models C, C-1, and C-2 are the same as they are for Models B and B-1 (i.e. down 5 percent). Similarly, the reductions in medical assistance and administrative costs are also shown as 5 percent in all five models.

Given the larger size of monthly benefit checks when there are children, it is more difficult to encourage refugees to take entry-level jobs when they are on AFDC than when they are on RCA, hence the use of the 5 percent reduction figure rather than a higher one.

Model C produces a national cost estimate of $879.3 million, compared to the Model A estimate of $938.7 million.

4. Model C-1

Model C-1 [**Chart 11**] is like Model C except that it uses the Medicaid-only, as opposed to RMA-plus-Medicaid, for health services. The health cost estimates are those used for Model B-1. Again, as in the B series, in Model C the federal government would cover all health costs the first year, but in Models C-1 and C-2 they would be split with the states. Model C-1 is estimated at $861.2 million.

5. Model C-2

Model C-2 [**Chart 12**] is similar to Models C and C-1, except that it takes a yet another approach to the delivery of health services. Instead of using the system in place for newly-arrived refugees (RMA), or the one in place for low-income Americans generally (Medicaid) it would largely utilize the various systems now used for federal employees. It would call for total federal funding of health services, through these channels, for eight months for RCA clients and for twelve months for AFDC clients. SSI clients would continue to be

Total Costs		Federal	$736.7[e]
		State	$ 46.2[e]
		Total	$782.9[e]
Per capita, for FY'95 arrivals (96,924)			$8,077[e]

Note: Estimated costs are the same as in Models C and C-1 except that median federal employee health insurance cost rates have been substituted for those of the RMA and Medicaid systems for RCA and AFDC clients. Also, [a] actual expenditures and [e] estimates.

covered by Medicaid. [The methods for estimating FY '96 median costs of providing health services to federal employees and their families, and thus to refugees is described in **Appendix E**.]

A glance at the bottom line of Model C-2 suggests one of its prime attractions; it would appear to reduce the costs of providing health services to newly-arrived refugees substantially, by more than $75,000,000 in comparison to Model C-1 and by even more vis-a-vis Model C (which shows the current practice in this field). These reductions are on the order of 30-40 percent.

As far as the states are concerned, such a program would substantially reduce health costs for first-year refugees. There would, however, presumably be some drawbacks.

First, there would be the inevitable friction as a new system was introduced to refugee-serving agencies, and, perhaps even more so, to the hundreds of health care providers now serving federal employees—organizations for the most part not accustomed to refugee clients.

Second, the cost structure of these health systems (although they vary remarkably from one another[17]) all are based on working with a largely native-born population, one that has had a lifetime of service from the American health system. In contrast, refugees prior to arrival typically have been minimally served by health systems and often arrive with an accumulation of unmet health needs.

In short, it will cost more to provide services to newly-arrived refugees than to government workers and their families. Were the refugees to be regarded as a single population (for health costing purposes) the estimates shown in Model C-2 would perhaps double or triple after a year or so of cost-experience.

Were the refugees, on the other hand, to be simply mixed in with the federal employees (for costing purposes) it would mean a tiny, and generally imperceptible, increase for all involved. There were an estimated 89,000 non-SSI refugee arrivals in FY '95; in contrast, there were 3,043,000 federal employees in 1993[18] and, if each employee was a member of a family of four, that would work out to more than 12,000,000 persons. Thus the arriving refu-

[17] In the sample of programs studied, for example, the monthly total cost for coverage of a single worker ranged from a low of $111 a month to a high of $249.

[18] *Statistical Abstract of the United States 1995*, table 542.

gees would account for less than 1 percent of the people served in the federal employee health systems in any given year (assuming that many arrivals); further, the refugees would all be out of the federal employee health system twelve months later.

Another Model

There are, of course, many other possible combinations and permutations of resettlement programs, but at least one of them should be mentioned. In this scenario, while the voluntary agencies would handle case management, counseling, training, and employment, the actual cutting of checks for RCA and AFDC would be handled by the states. This is clearly an area in which the states have more experience than the volags.

Further, as Frank Bien, the Maryland State Coordinator, has pointed out, many of the states are moving into the use of more and more high technology in the assistance programs. One such example is the distribution of Food Stamp benefits not with coupons, but with debit cards that can be used only in grocery stores (thus preventing many types of Food Stamp fraud). The use of such a model might bring with it a mild increase in up-front administrative expenses, while reducing losses through fraud.

Savings in Later Years

These descriptions of projected savings all have dealt with the first twelve months of refugee resettlement.

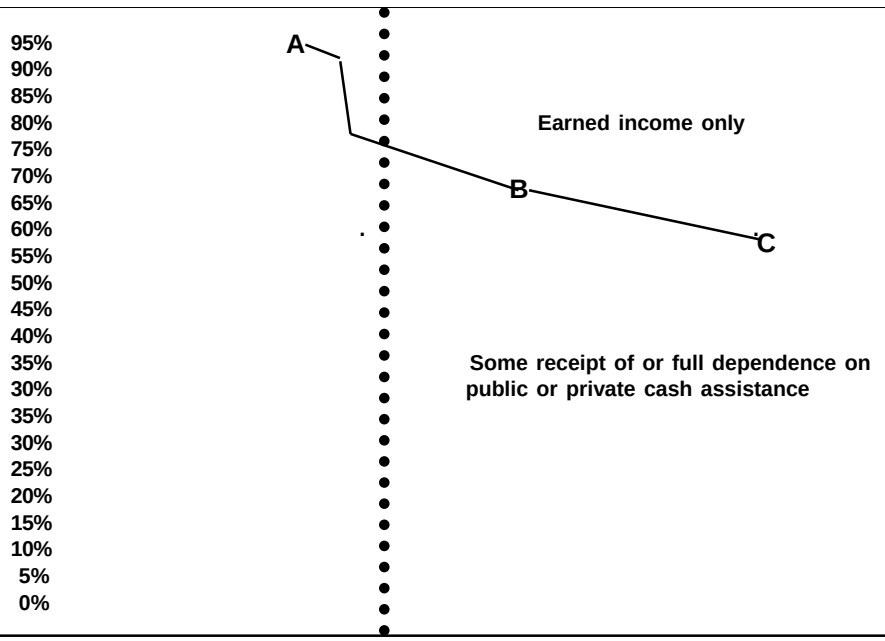
Although the initial costs of resettlement are considerable, the possibility of saving substantial funds by encouraging lesser utilization of assistance by refugees would pay major dividends in the later years, as **Chart 13** indicates.

It is, of course, much more difficult to make cost estimates deeper into the future, than for a single year, but with (at the moment) at least a five-year window for the receipt of AFDC [now TANF] by refugees, the utility of moving them into jobs early in the process is self-evident.

For example, securing a job for a refugee (that she keeps) nine months into the first year reduces first-year cash assistance costs by 25 percent but the same placement, when looked at in a five-year context, reduces those costs by 85 percent (three months of nonuse of cash assistance is 25 percent of twelve, while fifty-one months of nonuse is 85 percent of sixty.)

These estimated real savings would be largely invisible ones, making the institu-

Chart 13.
Pattern of Decline in Cash Assistance Usage by Refugees over Time
(Based Roughly on ORR Survey Data)



Note: This schema assumes that almost all arriving refugees use cash assistance, if only R&P funds, hence the location of A; the placement of B reflects the portion of refugees in the U.S. for five years or less who get along without cash assistance; as ORR survey data show the average for the five-year experience is at about B, then at the end of the five years the utilization rate is probably lower, such as at C. The shape of the line A-B-C is illustrative only.

`

The location of B, at 69 percent, is derived from the ORR Report to Congress FY '94, page 61, which reports 30.5 percent of the five-years-or-less refugee population as dependent on earnings only, hence 69.5 percent of the five-year refugee population depends, to some extent or fully, on assistance payments from various sources.

Notice what a large percentage of the savings, as represented by the area above line A-B-C, occurs *after* the first year in the country (shown by the dotted vertical line).

tion of such a reform—should it be regarded as good public policy—that much more difficult politically than it would be were the cost savings more visible.

APPENDICES

A: A Note About Educational Costs

Educational costs have not been calculated in this paper, but not because they are not significant. The cost of the full course of K-12 education for a single child dwarfs the costs of resettling a single refugee. As we have shown, the first- year costs of resettling a refugee run in the $8,000-10,000 range and then decline in later years, sharply for those who secure employment. In contrast, the U.S. was spending $5,528 a year per elementary and high school student ($71,864 for thirteen years) in 1993.[19]

The reasons for *not* calculating refugee education costs are dual: first, these costs would not be changed a bit were refugees to be resettled in a different manner; second, the history of refugee resettlement has been replete with the federal support of specific health and welfare costs of the refugees, but rarely has it done much about refugee education costs, *per se*. Some federal dollars help fund the education of refugee children, but only because they belong to a larger class, such as low-income children, or those involved in a bilingual instruction program.

B: A Note About Kentucky, Nevada, and Health Care Costs

There is a superficial resemblance between the San Diego USCC project and the USCC work in Kentucky and Nevada. In all three instances, USCC affiliates are operating under the wing of the ORR Wilson-Fish program, (a statutory arrangement for alternative resettlement systems) and in all three the affiliates are furnishing a one-stop refugee resettlement operation, providing R&P, cash assistance, and social and employment services to RCA refugees.

The San Diego program, however, was designed as an experiment to test an alternative resettlement model. (It does not, incidentally, deal with health care.) In the two other sites, the state government essentially withdrew from the refugee pro-

[19] Calculated from *Statistical Abstract of the United States 1995*, Table 287.

gram, and USCC stepped in to fill the gap.

While both the Kentucky and Nevada programs have been successful in finding work for refugees, neither, apparently has created a control group to evaluate its activities. (The San Diego program, in contrast, hired an outside evaluator whose report was not available as of this writing.)

Both of these statewide programs provided me with information, and both are among the smaller states in terms of FY '95 refugee arrivals (Kentucky 1,097 and Nevada, 609) but their experiences have been so different from one another that at first glance, one can not see them as fitting into any particular pattern.

For example, their reports on the three basic elements of resettlement costs (RCA, RMA, and administrative) are quite different. The AFDC unit costs (a proxy for RCA unit costs) are about 35 percent higher in Nevada than in Kentucky so the higher Nevada RCA costs [see below] should be expected. Nevada is spending considerably more on administration than Kentucky and much less on health care, with the principal variation in the latter instance being the medical insurance costs in the two states. The data follow.

COST CATEGORY	NEVADA (ACTUALS FY '95)	KENTUCKY (BUDGET 96-97)
RCA	$354,824	$ 231,661
RMA	$410,924	$1,909,937
Administrative	$289,388**	$ 100,403*

*Does not include its share of USCC's national Wilson-Fish administrative costs, which, for Kentucky came to about $70,000.

**May or may not include such costs.

On a second glance, however, two concepts emerge from these puzzling numbers:

1. There is a lot of room for state-by-state variations in refugee resettlement patterns and cost structures; and, more importantly,

2. Purchasing health care may become *the key factor* in managing the costs of refugee resettlement.

Recall that RMA costs about twice as much as RCA [see Model A, **Chart 3**] and that Medicaid (for the U.S. generally) costs five times as much as AFDC; Medicaid is

the wider program, but even on a *per capita* basis, Medicaid cost about twice as much in 1993 as AFDC ($3,042 v. $1,591).[20]

Reorganizing resettlement to reduce cash assistance costs may be an excellent idea, but perhaps the way to *really* contain costs in the refugee program is to figure out a way to purchase appropriate health services for refugees in a cost-effective manner. However, it may also be that the skills needed to cause refugees to seek work, rather than cash assistance, are quite different than the skills needed to make effective health care purchasing decisions. The resettlement dialogue has been focused on the first subject, not the second.

C: State-Supplied Data on Cash Assistance

Early in this study there was a hope that enough refugee cash and medical assistance data could be secured from the states to provide substantial insights; unfortunately, few states collect data or even make estimates on the use of AFDC and Medicaid by refugees, collecting only the data they need to meet the ORR requirements on RCA and RMA.

Several people, however, did have data, and it is appropriate to record what was learned from these refugee coordinators.[21]

Louisiana is a low-benefit state, with an average AFDC monthly family check of $164 in 1993;[22] one would thus expect that there would be more newly arrived RCA beneficiaries than continuing AFDC claims. This is the case. While the state does not collect data on refugees on AFDC, the state coordinator polled the local resettlement agencies and estimated that there were 65 people on AFDC in late 1996, as compared to a count of 312 RCA recipients.

Illinois and Colorado (both with an average $324 per month family benefits) are among the mid-level benefit states, and both maintain highly useful cash assistance tracking systems well beyond the ORR requirements, Illinois for two years, and Colorado, seemingly, forever (or at least since 1975).

---

[20] Total costs, in 1993, were $101,709,000,000 for Medicaid and $22,688,000,000 for AFDC. See: *Statistical Abstract of the United States 1995*, Tables 163 and 612.

[21] Steve Thibodeaux in Louisiana, Ed Silverman in Illinois, and Laurie Bagan in Colorado were very helpful. State Coordinator offices in Maine, Massachusetts, and Nebraska also provided information they had on the subject.

[22] *Statistical Abstract of the United States 1995*, Table 612.

CASH ASSISTANCE UTILIZATION / INDIVIDUALS / FY '95 / COLORADO

Year of Arrival	RCA	AFDC	Other	Total	Percent of Arrivals
1995	318	8	2	328	41.8
1994	0	51	47	98	8.1
1993	0	83	39	122	10.5
1992	0	87	67	154	13.4

Most of the "others" above are SSI cases.

The most useful Illinois data, for assistance utilization in FY '95, showed the following:

ILLINOIS REFUGEE DATA: FY '95

ARRIVALS MONTHLY	AVERAGE ARRIVALS PERSONS		PERCENT
FY '95	RCA	957	10.9
(4,464)	RMA/MG	736	17.0
	GA	264	6.0
	AFDC	940	21.7
		2,897	66.8
FY '94	GA	615	13.8
(4,335)	AFDC	941	21.1
		1,556	34.9

While the data above deal with two cohorts of refugees, those arriving in FYs '94 and '95, the numbers work out as one might expect were this a longitudinal data set: RCA and MG leave the scene after the first year, cash assistance drops sharply, GA is much more of a factor the second year, and, at least in this instance, AFDC remains stable. The two-year average for cash assistance utilization of 50.6 percent in Illinois (over the two years) is consistent with the national ORR survey data shown in **Chart 13**, but there is less welfare utilization in Illinois than nationally.

While the Louisiana and Illinois data tend to confirm national patterns, Colorado's does not because of a significant difference in the way AFDC is handled in that state. Most refugee families contain two parents, and are thus in welfare jargon "intact." In most states intact refugee families are eligible for AFDC (or more precisely AFDC-U); in Colorado, however, one must have documented work experience to qualify for AFDC-U. (In most states this documentation requirement is waived, and a declaration that one has worked sufficient quarters in the past will be accepted.) Refugees typically cannot produce such documentation, and, thus,

intact families are supported only by RCA in Colorado.

Because of this element in the system, the Colorado experience with long-term cash assistance utilization is much like that of the USCC operation in San Diego; refugees either get jobs or they leave the state.

Some workers in intact families get jobs in Colorado, however, and lose them later, and consequently qualify for AFDC-U. This explains why there is a mild *rise* in AFDC utilization (from a tiny base) as time passes.

D: Social Service Usage by Asylees and Refugees[23]

In a nonlegal sense, one might lump refugees, asylees, and asylum seekers into a single category: people fleeing from persecution in their homeland (or arguing that they are doing so). Thus, a casual observer might think that refugees, asylees, and asylum seekers all have the same rights to social service benefits and the have same patterns of utilization. But this is not so.

In general terms, asylees and U.S. government-recognized refugees have the same legal rights to social service benefits, which can be extensive. Asylum seekers, however, have legal access to very few government-funded programs. Further, although the evidence is sketchy, it appears that asylees are much less likely to be extensive users of social service programs than refugees. There appears to be nothing within the asylee experience that is comparable to the widespread use of AFDC by large Hmong families in California and Wisconsin, for example, or the widespread use of SSI by age sixty-five or older former Soviets in Brooklyn; these are refugee, not asylee, populations.

Additionally, eligibility to work legally in the U.S., as symbolized by the Employment Authorization Document [EAD] and eligibility for federally-funded social services are handled quite separately for the asylum applicant and the asylee populations—even as they are neatly linked for the refugee population.

- *Refugees*, as they arrive in the U.S., immediately are granted the right to work and to an array of social service programs, the latter slightly wider than that enjoyed by citizens. (In their first eight months in the nation, low-income refugees can secure both Refugee Cash Assistance [RCA] and Refugee Medical Assistance [RMA] even if they

are single adults, i.e., without the dependent children needed for AFDC eligibility.)

- *Asylum applicants* are eligible for virtually no social services beyond the bare minimum, i.e., those services provided to illegal immigrants (emergency medical services and K-12 public education.)[24] Asylee applicants in the past had access to EADs after 90 days, and currently after 180 days, provided that they have not encountered a final rejection of their claims.

- *Asylees*, on the other hand, are eligible for the full collection of refugee benefits described above.

So much for the rules. In practice it appears that asylees are much *less* likely than refugees to make use of their eligibility for cash assistance. While no formal work has been done on this matter, we do have two strong sets of indicators. The first one is statistical. There is a much lower use of Food Stamps and Supplemental Security Income [SSI] among the asylees than among the refugees [see **Chart 14**].

The second indicator is a structural one. Yes, asylees are eligible for the same set of benefits as refugees; but, while refugee benefits start upon admission to the U.S., asylee benefits occur only after asylee status has been granted. Until reform, asylum applicants rarely received asylee status during the fleeting eight months of Refugee Cash Assistance, so asylees do not experience the temptation of instant welfare benefits (as refugees do); instead they have to work for a living (legally or illegally) and this sets them on a path to employment, rather than welfare.

Further, and probably of at least equal importance, the prospect of asylum in the U.S. attracts a somewhat different population than the prospect of refugee life in the U.S. While the refugee process brings whole families to the U.S, including people who are old and/or disabled (and thus eligible for SSI), the chancier asylum process is more likely to attract younger, more able-bodied people.

Finally, there is the variable of financing the trip to the U.S. Refugees receive travel loans and pay nothing up-front for the airplane trip to the U.S.; asylum applicants (or their families) pay for the plane ride, indicating that they have at least a little more money, on average, than refugees.

The delay in securing asylee status, at least in the past, has been such that the eligibility of asylees for Refugee Cash Assistance [RCA] has been little utilized, if ever, ac-

Chart 14.
Food Stamp and SSI Usage among Refugees and Asylees

POPULATIONS	PROXY FOR THE SIZE OF THE TWO DIFFERENT POPULATIONS (COLUMN 1)	SSI USERS DEC. 1995 (COLUMN 2)	COLUMN 2 AS % OF COLUMN 1 (COLUMN 3)	FOOD STAMP USERS FY 1994 (COLUMN 4)	COLUMN 4 AS % OF COLUMN 1 (COLUMN 5)
REFUGEE ADMISSIONS (1987-1994)	809,316	149,100	17.9	363,000	44.9
ASYLEE APPROVALS (1987-1994)	48,336	4,100	8.4	12,000	24.8

Note: Both asylees and refugees are aliens who have, by definition, convinced the U.S. government that they are fleeing from persecution; asylees and refugees, once recognized as such, have exactly the same sets of rights to government benefits and services. Refugees, however, travel to the U.S. by plane on U.S. travel loans, and upon arrival they have instant access to cash assistance and government-funded volag services. Asylees must pay for their own travel to the U.S., have *no* rights to benefits and services on arrival, and typically work illegally until securing asylee status. It is argued that this initial differential treatment has an impact on the subsequent patterns of social service utilization by these aliens.

Sources: Admissions and approvals data are from the *1994 Statistical Yearbook of INS*, Tables 25 and 29; unpublished SSI utilization data from the 1 percent sample of SSI recipients, by telephone, from SSA/Baltimore; unpublished Food Stamps utilization data from the Food and Nutrition Service/Alexandria, by telephone.

cording to those at the ORR dealing with such matters. Asylees can, however, should they meet the family and income requirements of AFDC, be eligible for that program were they to apply. I did not find any asylee-specific data on AFD utilization, but would suspect that AFDC, like Food Stamps, would be utilized less by asylees than by refugees.

E: Estimating the Median Cost of Federal Employee Health Services

Model C-2 includes an estimate of what it would cost the federal government were it to provide most health services to refugees through the systems used for federal employees and their families. Those estimates are, in turn, based on the prevailing (1996) monthly premiums; these premiums are the total cost of the programs and include both federal and worker payments.

There are more than 1,000 such programs, sometimes organized for a particular group of employees (e.g., foreign service officers), but more often relating to a specific health service catchment area. Some are managed fee-for-service programs, some are "plans with a point-of-service product" but most are Health Maintenance Organizations [HMOs]. The monthly costs vary widely.

Virtually all of the premiums in this system are either for "High Self" coverage, i.e., for the worker only or "High Family," for the worker and his/her dependents. The handful of "standard" rates were not included.

Estimation of a median cost for these programs involved the following steps:

1. I obtained from the government personnel office serving the Administration on Children, Youth, and Families a seventy-one-page publication, *Non*-Postal Premium Rates for the *Federal Employees Health Benefits Program* (whose source, while clearly within the federal government, was not shown);

2. I used a sampling strategy, writing down the first "High Self" monthly premium on each page of the listing, rounding to the nearest dollar (for the RCA and SSI clients in the refugee program, most of whom are single individuals or childless couples), and then used the merge/sort function in WordPerfect to find the median among these seventy-one entries;

3. I repeated the same operation for "High Family" benefit amounts (which was used vis-a-vis the AFDC population);

4. In this manner I found monthly medians of $163 for individuals and $422 for families.

5. I then calculated annual cost figures, per covered refugee unit, as follows: AFDC 12 mos. x $422 = $5,064; RCA 8 mos. x $163 = $1,304.

   The SSI population in this scenario is to remain in Medicaid (where it is now); 1993 data on the average annual cost of 65+ Medicaid recipients is $8,168.[25]

6. Then using the proportion of AFDC-RCA-SSI cases seen in **Chart 5** above, I secured the following population estimates (for those individuals arriving in FY '95): AFDC 57,185, SSI 7,754, RCA 31,985, for a total 96,924 individuals.

7. I selected an admittedly arbitrary estimate of 4.0 members for each refugee family in the AFDC category,

8. I divided 57,185 by 4.0 and found a family total of 14,296.

9. Next I multiplied the populations shown above (in steps 6, 7, and 8) by the first year cost figures (in step 4) as follows: AFDC 14,296 (families) x $5,064 = $72,394,944; RCA 31,985 (individuals) x $1,304 = $41,708,440.

   This produced a rounded total of $114.1 million for this group. The calculation for the SSI clients in Medicaid was: SSI 7,754 (individuals) x $8,168 = $63,334,672.

   Applying the usual 55-45 percent formula for the division of Medicaid costs between the federal and the state levels produces these rounded numbers: $34.8 million federal and $28.5 million state, as is shown in Model C-2.

U.S. COMMISSION ON IMMIGRATION REFORM

The U.S. Commission on Immigration Reform is a bipartisan commission authorized by the Immigration Act of 1990 and charged with examining immigration policy and its impact on social, economic, and community relations, on population size and characteristics, and on the environment.

Acknowledgements

We owe thanks and gratitude to many people and several institutions for assistance in conducting and completing this project. Regrettably, we cannot acknowledge all of them here. Several groups of persons, however, deserve special recognition.

First, we wish to express our appreciation to the people in El Paso and Juárez who freely cooperated with and generously gave their time and assistance to the project. We especially want to thank Chief Patrol Agent Silvestre Reyes of the Border Patrol and Mayors Larry Francis and Francisco Villareal of El Paso and Juárez, respectively. Also, Mr. Martin Gonzalez de la Vara of El Colegio de la Freontera Norte in Juárez was helpful.

Second, we are very grateful to Angela Escajeda, Cheryl Howard, Bryan Roberts, and Kathleen Staudt for advice and assistance at various points in the research.

Third, we wish to acknowledge the contributions to the project of The University of Texas at Austin. Both the Population Research Center (through a grant from the MacArthur Foundation) and the Institute of Latin American Studies (through a grant from the Mellon Foundation) provided support. The Population Research Center also receives core support for certain projects from the national Institute of Child and Human Development [NICHD grant #HD-06160].

Fourth, Eve Karabanow, Joseph Salazar, and Jennifer Scalora provided research and other assistance that was, without question, "above and beyond the call of any duty." We are truly grateful.

I. Introduction

On September 19, 1993, Silvestre Reyes, the Chief of the El Paso Sector of the Border Patrol of the U.S. Immigration and Naturalization Service [INS], launched Operation Blockade along a twenty-mile stretch of the U.S./Mexico border between El Paso and Juárez. Renamed Operation Hold the Line three weeks later (to avoid the negative connotations associated with the word "blockade"), the initiative represented an effort to cut off illegal migration from Mexico into El Paso (and through El Paso into the United States). As such, it involved a major shift in strategy on the part of the El Paso sector Border Patrol. Previously the Border Patrol had allowed relatively unhindered movements across the river, concentrating on the subsequent interception of crossers who had already entered the city, including those who were trying to move inland at major transportation arteries (roads, railroad lines, and airports). While the old strategy took advantage of the rugged, arid terrain around El Paso that makes it difficult for long distance migrants to move to other destinations once they have entered, it allowed easy access to El Paso for substantial numbers of undocumented Mexicans who were not intent on migrating on to other destinations. The new strategy, however, by saturating the border between El Paso and Juárez with agents, was intended to curtail both local and long-distance illegal migration.

This research examines the workings and effects of Operation Hold the Line, starting with its inception in late September 1993 and running through April 1994, the latest release date for relevant data as of the writing of this report. The main goal of the Operation was to slow illegal flows. In the words of the Border Patrol, "Operation Hold the Line's main mission is to prevent . . . undocumented aliens from crossing illegally" (Reyes 1994). Hence, the first objective of this study is to assess the extent to which a slowdown in such flows has been achieved. The second major goal of the study is to determine the social and economic effects of the Operation on El Paso/Juárez. This is not only crucial for determining the extent to which the Operation is achieving its primary mission, but it is also fundamental for developing rough overall assessments of the Operation. Without knowing its consequences, it would be difficult to tell if the Operation has been working in the ways it was intended, not to mention hard to render an overall judgment about the balance of positive and negative consequences that it might be generating.

The study's ultimate objective, which is to discern the larger significance of the Operation for issues pertaining to U.S. immigration and immigrant policy, has several implications. First, it means consequences must be assessed for both El Paso and Juárez. If apparently positive effects in one community are accompanied by seemingly negative effects in the other, then focusing on only one side of the border could give misleading impressions about the overall effects on two cities tied by a symbiotic (if at times uneasy) relationship. Obviously each city's home country retains sovereignty over its side of the border. But equally clearly, if one city gains at the expense of the other, hardship and disequilibrium may result, with attendant implications both for the kinds and numbers of Mexicans wanting to migrate to the United States and for the kind of reception migrants encounter when they arrive.

Second, different persons cross the border between Juárez and El Paso for different reasons, which means that there are several different types of border crossers. Generalizations about one type of flow may not apply to another type. Thus, Operation Hold the Line may have affected (and may be affecting) these different kinds of crossers in varying ways. It is critical to examine initiatives like Operation Hold the Line within a framework that from the very beginning takes into account this possibility. This conceptualization of multiple kinds of border crossers provides not only a multidimensional framework for examining the workings and effects of Operation Hold the Line, but one that also holds the promise of leading to new ways to assess the effectiveness of border control policies and strategies.

Third, and relatedly, an adequate interpretation of the effects of Operation Hold the Line must consider a multiplicity of outcomes. For example, an interpretation that seemingly explains changes since the inception of the Operation in apprehension sta-

tistics but not in hospital admissions and births, for example, is less useful than one that explains both. The strategy used examines a wide range of consequences that might be thought to be associated with the Operation. This offers the advantages of both greater comprehensiveness of coverage and an increased likelihood of discerning the Operation's effects. Whereas individual pieces of evidence may not provide enough basis for reaching firm conclusions, many different pieces of evidence taken together carry greater weight and provide a stronger basis for research conclusions, especially if these generally point in the same direction.

Certain theoretical and methodological considerations have implications for the strategies followed in this research. Theoretical notions about the U.S./Mexico border consist of implicit and explicit ideas people hold and articulate about the structure and functioning of economic and social relationships in the relevant regions of both countries. Different theories influence thinking about the kinds of immigration (and other) policies that various observers believe are most needed in a post-NAFTA environment. Views that give overriding emphasis to the border as a mostly geographic boundary between sovereign states tend to highlight divergences in state interests and the need for policies that protect these, just as views that give predominant weight to the border as an area in which northern Mexico and the southwestern United States are inextricably tied together tend to highlight convergences in state interests and the need for policies that foster further integration (Bean, Vernez & Kelly 1989; Weintraub 1990).

The theoretical view used here combines elements of both of these. It is akin to perspectives that see the border as a complex mixture of both integrating and differentiating processes that are often in tension with one another (Lowenthal & Burgess 1993). Policies that would either only increase legal crossings or only restrict illegal crossings risk oversimplifying the complexities involved in border dynamics. As shown below in the case of the U.S./Mexico border in general, and in the case of Operation Hold the Line in particular, legal and illegal migration are not only connected by virtue of U.S. immigration policy and border control strategies, they also often appear to substitute for one another. This examination of Operation Hold the Line thus seeks to assess its effects on both illegal and legal crossings, as well as to discern the implications of these for various policy options concerning both legal and illegal immigration and nonimmigrant crossings at the U.S./Mexico border.

Methodologically, this research relies on both quantitative and qualitative evidence to develop an assessment of the Operation. The former includes official statistics that provide a basis for ascertaining the representativeness, scope, and magnitude of the Operation's effects. Border crossing and apprehensions data, police and crime data, birth and hospital data, education and school attendance statistics, and sales tax and general sales data were examined. The qualitative evidence is obtained from ethnographic fieldwork and in-depth interviews that provide information about motivations and processes not always revealed in official statistics; over four months the research team conducted interviews with nearly two hundred persons, including both local and federal government officials in both El Paso and Juárez, as well as numerous other persons at border crossing sites and other locales in both cities. The objective of the study is thus to combine the lessons from both qualitative and quantitative data into an interpretation of what has been happening in El Paso/Juárez as a result of the onset and continuation of Operation Hold the Line.

The monograph is organized into nine chapters. After the introduction, the second is a description of Operation Hold the Line, together with a discussion of the geographical and metropolitan context within which the Operation has taken place. The third examines evidence about the curtailment of flows as indicated by border crossing and apprehensions data. The fourth examines effects on business and economic activity, and the fifth analyzes effects on education, births and social services. The sixth presents an examination of the effects of the Operation on crime rates and other indicators of illegal or disruptive behaviors. The seventh details effects on community and public opinion. The eighth chapter focuses on the Operation's consequences for Juárez

and the people living there, paying special attention to the experience of obtaining and using Border Crossing Cards. The ninth provides an overall assessment of the Operation's effects, together with discussion of the implications of the study's findings for immigration and border crossing issues.

II. The Operation and Its Context

This chapter presents a brief description of the Operation, followed by a discussion of the wider metropolitan and border crossing context within which the Operation began and continues to the present day. Two aspects of context are particularly important: the geographic and urban structural features of the larger El Paso/Juárez metropolitan area that both constrain and compel certain kinds of migration patterns; and the policies governing legal nonimmigrant border crossings between Juárez and El Paso, together with their implementation, that structure the interrelationship between legal and illegal migration in the region. Thus, understanding the effects of the Operation necessitates both an awareness of the circumstances under which legal crossings take place and a recognition that these can often influence illegal crossings.

Operation Hold the Line

Operation Blockade was launched on Sunday, September 19, 1993. Conceived by Silvestre Reyes, Chief Patrol Agent for the El Paso Sector of the United States Border Patrol, the Operation represented a major change in strategy for controlling the border in the El Paso sector. The previous emphasis had been on apprehending suspected illegal aliens once they had crossed the border. The new concept was to enhance linewatch operations by maintaining a high profile along a stretch of approximately twenty miles of border in the metropolitan El Paso area. The goal was to discourage the unregulated flow of illegal migration of individuals from Mexico into El Paso and the United States by stopping people before they crossed the border (Martin 1993).

Shortly after his appointment in July, 1993, Chief Reyes submitted plans for Operation Blockade to Headquarters, U.S. Immigration and Naturalization Service [INS], suggesting that the border could be controlled with an aggressive, high-profile interception strategy. INS approved the expenditure of $300 thousand for the operation, primarily to fund overtime payments. The Operation was launched shortly after midnight on September 19, when 130 agents and 3 maintenance crews were deployed to saturate the line along the river and to begin repairing holes in the border fence. More than 400 of the El Paso Sector's 650 Border Patrol agents were deployed 24-hours-per-day, 7-days-per-week along the border. Agents were withdrawn from such other duties as employer sanctions, traffic checks, and support positions, to double the number of agents stationed along the border. Prior to the initiation of Operation Blockade, the Border Patrol had concentrated less on illegal migrants crossing the border and more on tracking them down and arresting them after they crossed and as they moved on to other destinations. The new Operation was designed mainly to curtail illegal crossing. Other major goals of the Operation, according to Chief Reyes, were to reduce crime, panhandling, and street vending in downtown El Paso and to remove agents from situations that sometimes not only led to the accidental harassment of Mexican Americans in El Paso, but also placed agents at risk of personal injury.

The blockade took a three-pronged approach. First, a line of Border Patrol agents was established in full view of the border. Parked in their distinctive, signature-green Chevrolet Suburbans on the levee roads along the Rio Grande from border monument number one in the west to the Ysleta headgates in the east, the agents, through the sheer force of numbers, were intended to deter potential illegal border crossers. Agents were stationed close enough together to have visual contact with other agents on either side of them. Some were as close as fifty yards and others as far apart as one-quarter mile, depending on the terrain. Agents were instructed to apprehend and detain illegal border crossers and to call for assistance and reinforcements as required. Con-

centrations of agents were particularly heavy at the most common border penetration locations, such as railroad bridges and shallow points in the river.

Second, four helicopter patrols were established and operated during the three-week blockade. Airborne agents maintained radio contact with agents on the ground to coordinate deterrent efforts.

Third, the 9-mile stretch of the border fence in the downtown El Paso area along the Rio Grande River, which had numerous holes and was breachable in some 125 locations, was repaired. The holes in the fence were closed at the start of Operation Blockade; the agency effected rapid repairs as new holes were created by migrants trying to cross the border.

A week prior to initiating the Operation, Chief Reyes informed Mr. Alfred Giugni, El Paso INS District Director of the impending operation. The INS District Office is responsible for controlling border crossings at ports of entry. To strengthen bridge traffic-screening capabilities in El Paso, Mr. Giugni requested additional manpower from the INS regional office in Dallas. A team of one coordinator, nine immigration inspectors, and one K-9 drug-sniffing dog and handler was dispatched for the initial three weeks of the Operation. INS agents at border-crossing points of entry were instructed to inspect documents of individuals passing through inspection stations more thoroughly than previously. As a result of the closer inspections, some 443 Mexican Border Crossing Cards [BCCs] (INS forms I-186/I-586) were seized in the first thirty days. Some were confiscated because they were counterfeit, while others were carried by unauthorized holders or by people who were thought to be crossing the border to work illegally.

The initiation of Operation Blockade produced a diversity of reactions. The Operation was widely covered by both the U.S. and Mexican media, and in general the response in El Paso was favorable. Radio call-in polls in El Paso reported overwhelmingly positive reactions with levels of support running higher than 90 percent. The national news media ran numerous stories praising the Operation. A *Time* Magazine article quoted Mayor Larry Francis: "The rampant criminal problems in our downtown are gone," and Fred Morales, from the Chihuahuita barrio, said "The stabbings and shootings are down to zero" (Woodbury 1993). On the *MacNeil/Lehrer News Hour* on November 23, Doris Meissner, the newly appointed Commissioner of the Immigration and Naturalization Service, said of the Operation: "It's been a very successful program from an enforcement standpoint. . . . because it has prevented illegal immigration from occurring." In California, officials called for a similar program along their state's southern border (Pinkerton 1993). Many other similarly positive reactions were reported.

In Juárez, however, reactions were more negative. For example, an interview with the *presidente municipal* (mayor) of Juárez, Francisco Villarreal, Abelardo Escobar, the *secretario del ayuntamiento*, and Jose Albert Silva, the *director del gobierno* revealed that the mayor had first learned of Operation Blockade in the press. He felt that the U.S. authorities should have notified their counterparts and local government officials on the Mexican side before launching the Operation in September 1993. Although he opposed the Operation from the start as an "unfortunate, discriminatory, and unjust measure," Villarreal felt that fewer problems would have resulted had consultation with the Mexican side been pursued:

> A lot of it has to do with the way it was done. The way they chose was terribly unfortunate. We have a good relationship with Mr. Reyes [the Border Patrol chief]. He has been here several times, but this was something different. . . . If you go about things the right way it is very easy to find a common objective. Actions that converge upon the same thing. But they didn't give us that opportunity, but rather presented the blockade as adversaries.[1]

He also added that as mayor of Juárez, he had no objection to the Border Patrol's enforcement of U.S. laws, but only to what he saw as the disrespectful and inconsiderate way in which the new enforce-

[1] All direct quotes in this section are translated from Spanish.

ment strategy was implemented.

Like other Juárez citizens and business leaders interviewed, Mayor Villarreal was particularly concerned by statements—made by Chief Reyes and later repeated in the press—that associated undocumented Mexicans with crime in El Paso. He noted the lack of U.S. efforts to cooperate with the appropriate authorities in Juárez before acting unilaterally. He also said the implication that Mexican nationals are responsible for downtown El Paso's crime problems is especially rankling to Juárenses given the numerous disturbances caused by drunken El Paso revelers on the streets of downtown Juárez:

> You can't associate crime with Mexican crossers. Whether it's true or not. But if even if it is true, you don't bring it up publicly! Nobody can say that Mexican delinquents go to El Paso. Why don't we talk about the American delinquents who come over here to get drunk before going home? Because I have no reason to say it. I have to see what can be done about it first. At three o'clock in the morning, the people coming out of the bars are pure Americans—children and adolescents that come over here just to raise hell. Why should I broadcast that? I need to call across the border to my counterpart to see what we can do about it.

Mr. Escobar added that if all the *ilegales* that had been prevented from crossing into El Paso were in fact *delincuentes*, then Juárez would have experienced a sharp rise in petty crime. It did not. Instead, he noted, it experienced a boom in street vending by persons who before the Operation sold their wares in El Paso.

Like many Juárez citizens who spoke with us, the city officials were critical how INS officials treated legal Mexican border crossers at the ports of entry. Mr. Escobar discussed the fear and intimidation that the INS inspector confiscation of Border Crossing Cards [BCCs] provoked among Juárez residents:

> One important thing about the checking of the Border Crossing Cards. A lot of our people in Juárez work here and cross over to El Paso to shop, or for other activities. It takes a lot of effort for them to get their crossing card. When officials on the bridges put pressure on them, people get nervous. They're afraid that they're going to have their card taken away. This provoked a kind of psychosis in the community. Especially among the most humble people, the ones who can least defend themselves. If one of these officials is hostile towards me, and demands to know where I'm going, and what I'm going to do in El Paso, this is going to upset me, even if I'm not going to do anything bad. And many people don't know exactly what their rights are or how the official is supposed to act, and these people don't know how to stand up for themselves in such a situation. So when they started inspecting crossers so aggressively, a lot of people just stopped going to El Paso because they were afraid.

At the same time, the mayor and the other officials emphasized that the tolerance of illegal crossing for so many years by the Border Patrol led many Juárez residents not to bother to apply for the Border Crossing Card. They also thought it undermined the legitimacy of the U.S. authorities in the minds of many Mexican border residents. Mr. Escobar described the situation on the international bridges before Operation Hold the Line:

> Before the Operation, for many years, the people of Juárez went to El Paso, oftentimes illegally. Some through the river, others even over the bridge! On the Bridge of the Americas you could be waiting in line to be inspected, and on the left hand side of the bridge, that other side, you could see people walking north right through [illegally] into the United States, just fifty meters away from the official inspection point. And there we'd be, right on the bridge, and we'd watch—I don't know how the Border Patrol let this happen—we'd watch people walk through, with strollers, with children, with bags. And here you are in line to enter, asking yourself, "How is this possible?" Here they're asking

> you, "Where are you going? What do you intend to do in the United States?" A series of aggressive questions. And I'm here in line, my passport in hand, and I'm not bringing in any contraband. And watching the people walk right on through on the other side, freely. Then all of a sudden the Border Patrol shuts off this "unofficial" entry into El Paso, you know? That was tolerated for years. It wasn't that it was hidden, it was tolerated.

The concern felt by Juárez residents after the blockade began came in large measure, these officials agreed, from the overnight shift from evident tolerance of illegal crossing by Mexicans on the part of the Border Patrol, to zero tolerance. Moreover, the Border Patrol's historical tolerance of illegal border crossing had resulted in many families in Juárez becoming dependent upon goods and incomes brought back by family members who crossed illegally into El Paso.

On October 2, after more than 800 hours of overtime costing more than $250 thousand, Operation Blockade ended. By the time the money to fund payments of overtime compensation had been expended, Chief Reyes had decided to continue the operation indefinitely because of its apparent success in curtailing illegal flows into El Paso. He reassigned agents from the interior of the El Paso Sector[2] to work the extreme ends of the line and continue the operation. The strategy continued to be implemented, now renamed Operation Hold the Line because the military-sounding term "blockade" had offended community leaders in both El Paso and Juárez. Chief Reyes was further able to augment his core cadre of agents by requesting through Border Patrol headquarters the temporary reassignment of northern border sector personnel. Thus far, agents from sectors in Maine and Washington have been detailed to augment the El Paso sector on thirty-day assignments. In a long-term action, Attorney General Janet Reno announced on February 9, 1994, that fifty additional agents would be hired and assigned to the El Paso Sector to further support implementation of the strategy.

On October 10, 1993, in an extension of the strategy, the Border Patrol also proposed building a wall dividing Sunland Park, New Mexico from Rancho Anapra, Chihuahua, a poor squatter settlement on the outskirts of Juárez and a favorite illegal crossing point for Mexicans that is so easy to traverse that Border Patrol agents refer to it as the "Anapra port of entry." The squatter settlement at Anapra is not served by the Juárez water or sewage system; residents of Sunland Park have for years given water to their neighbors across the line by running garden hoses across the border. Many residents of Anapra have shopped, worked, and even gone to church in Sunland Park. It is virtually impossible, especially at night, to prevent illegal crossings, and the Border Patrol believed that building a wall would be necessary to control illegal crossing there. Hence, Silvestre Reyes announced his intention to construct a 2.8 kilometer steel wall on the slopes of Mount Cristo Rey in the Sunland Park area.

This action was immediately dubbed "the border's own Berlin Wall" in the Mexican press. The proposal to build a wall also drew an immediate response from the governor of the state of Chihuahua, of the *Partido de Acción Nacional* [*PAN*], who denounced the idea as "part of the environment of hostility that has arisen on the border," adding that the wall "will not stem the flow of undocumented migrants." Further, he called on Mexicans to "abstain from shopping in El Paso, Texas, during this Christmas season." The governor's call for a boycott was backed immediately by such business organizations such *Cámera Nacional de la Industria de la Transformación* [*CANACINTRA*] and *Cámera Nacional del Comercio* [*CANACO*], whose spokespersons talked of possibly reviving "Operation Dignity," a public "buy Mexican" campaign of the past to convince Juárez residents to refrain from shopping in El Paso. The call for a boycott, however, was not supported by the city government, also controlled by the *PAN*.

The consul general of Mexico in El Paso, Texas, Armando Ortiz Rocha, called the proposed wall,

[2] The El Paso Sector includes two counties in West Texas and all of New Mexico, an area of 125 thousand square miles and 289 miles of border.

"unfriendly, inopportune and imprudent" and "an unjustifiable aggression." Other organizations expressing opposition to the wall included both the Hispanic and Greater El Paso Chambers of Commerce, some human rights and Latino civil rights organizations, as well as Mayor Larry Francis of El Paso. Bruce King, the governor of New Mexico also weighed in, saying that the wall would send an "unfriendly message" at exactly the wrong time, during the ongoing negotiations on the North American Free Trade Agreement [NAFTA]. Also, on Friday, October 10, the mayors of both El Paso and Juárez had confirmed their participation in a series of cultural and artistic events that were planned under the rubric of "Day of Unity: We are all *Fronterizos*." The culmination of "Day of Unity" was to have been the signing by city officials and civic leaders from both cities of a "good neighbors convention" at the international line on the "Free Bridge" connecting the United States and Mexico. The signing ceremony was canceled at the last minute to protest the wall proposal. The Juárez mayor declared his opposition in an official statement, as did Mayor Francis of El Paso, who said the wall "would send the wrong message," a view shared by Congressman Ron Coleman.

The Metropolitan Context

The nature of the El Paso/Juárez metropolitan area must be understood to appreciate fully the constraints facing the Operation. El Paso's unique geographical location has played a vital role in its social, economic, and political development. The city lies in extreme west Texas, at an elevation of 3,762 feet. To the east lies the west Texas desert, while to the west lie the Rocky Mountains. El Paso is connected to the rest of the United States by air (an international airport), rail (three major railroads), and highways, but the city remains nonetheless somewhat isolated because of the long distances that must be traveled to reach other population centers. Although El Paso lies along U.S. Interstate 10, a main cross-country highway that connects the Atlantic Coast at Jacksonville, Florida, to the Pacific Coast at Los Angeles, vast distances must be covered to reach other major cities: to the west, Phoenix is 400 miles, San Diego 725 and Los Angeles 790; to the east lies San Antonio (560 miles), Dallas (625 miles), Houston (750 miles), and New Orleans (1100 miles). El Paso also straddles the Pan American Highway, which connects Nome, Alaska to Tierra del Fuego at the southern tip of South America. Albuquerque, New Mexico, lies 275 miles to the north, along U.S. Interstate 25. Ciudad Chihuahua lies 240 miles to the south of Juárez on Mexican National Highway 45.

El Paso, with a population in 1990 of about 600 thousand persons, is the largest U.S. city on the Mexican border and the twenty-sixth largest city in the United States. Juárez, with a 1990 population of about 800 thousand persons, is the fourth largest city in Mexico. The juxtaposition of the two cities has led to dense economic and social ties between the residents of El Paso and Juárez. During the Prohibition Era, two prominent Kentucky distilleries relocated plants to Juárez and several El Paso bar owners moved south. Tourism flourished as numerous associations decided to hold conventions in the city. During World War II, the establishment of training facilities led to a military build-up that, in turn, resulted in extensive border crossings. The disparities between U.S. and Mexican divorce laws led to continued growth in El Paso's tourist industry during the 1940s through the 1960s as many U.S. citizens lodged and dined in El Paso while arranging their divorces in Juárez. Finally, the *maquiladora* [assembly plant] industry has grown and been significantly influenced by the economy and laws of both countries (Hirsch 1987; Martinez 1994).

The legacy of El Paso's past is a multicultural, bilingual, international city of more than one-half million people. Nearly 69 percent of the population claim Mexican origin. Both English and Spanish are spoken regularly. According to the 1990 U.S. Census, English is spoken by 85 percent of the people, while 64 percent of the people speak Spanish (U.S. Bureau of the Census 1993). Many families can trace their ancestry to settlers who came to the Paso del Norte region hundreds of years ago. This history has resulted in a feeling of community that often transcends the international boundary. The population includes Caucasians, African-Americans, Native Americans, Asians, and Pacific Islanders, and the

international flavor of the city has been enhanced by resettlement of Vietnamese refugees and the presence of foreign military personnel. However, the city's predominant tenor derives from its heritage as an Old West town on the Mexican border.

The large populations relative to other border towns, the geographic isolation from other parts of the United States and Mexico, and the cross-border familial relationships between people in both cities have resulted in a special relationship between El Paso and Juárez. Relatives visit back and forth, residents regularly cross the border to shop for items either not found in their home city or to take advantage of lower prices in the other city. On Halloween, Mexican children routinely cross into El Paso to "trick or treat" (except in 1993, when INS port of entry inspectors denied entry to those without Border Crossing Cards) (Conely & Parra 1993).

That relationship notwithstanding, tensions have arisen in the past. The problems of air quality and pollution sources are prime examples of strains that have developed between the cities. Past incidents also include the arrest of an El Paso policeman and the seizure of his police car when he entered Mexico after pursuing an auto theft suspect (Ivey 1992a, 1992b) and the shooting of a nineteen-year old El Pasoan, allegedly by a Juárez police officer (Olvera 1992b). The implementation of Operation Hold the Line certainly raised concerns in Juárez, spawning anti-American protests and a proposed boycott on shopping in El Paso. Nevertheless, as tensions have arisen between the cities over the years, efforts to respond with a sense of cooperation and joint venture have been common. Air quality is a major concern in El Paso, and it is adversely affected by pollutants from Juárez . An El Paso/Juárez International Air Quality Management District has been proposed for the purpose of resolving many of those problems (Negron 1993). Various official and unofficial agencies and groups meet periodically to improve relations and work on joint projects. The two city councils have met in joint session (Jauregui 1992); the chambers of commerce work together on tourism and economic development issues (Hamann 1993; Townsend 1992), and local officials coordinate with federal officials to facilitate international cooperation (Townsend 1991).

Economically, El Paso is a relatively poor city, with more than 25 percent of its population living below the official poverty line (U.S. Bureau of the Census 1993). Per capita income falls 30 to 35 percent below the state of Texas average (Institute for Manufacturing and Materials Management 1991). The federal government is the major employer in the region. Three major military installations—Fort Bliss, White Sands Missile Range, and Holloman Air Force Base—lie within 100 miles of El Paso and supply the city and region with a large number of jobs and significant economic activity. The military base populations, which include military personnel, their dependents, civilian employees, civil servants and defense contractors, number about 95 thousand. Additionally, more than 15 thousand retired military live in the region. The economic impact of this military presence was nearly $1.3 trillion in 1990 (Institute for Manufacturing and Materials Management 1991). Other federal agencies, such as the Immigration and Naturalization Service, Border Patrol, Customs Service, also have an economic impact on the region (Institute for Manufacturing and Materials Management 1991).

Tourism is the second largest source of revenue for the city. The *maquiladora* industry provides jobs and money to El Paso as well. At one time there were as many assembly plants in El Paso as there were in Juárez (Institute for Manufacturing and Materials Management 1991). However, as productivity and skill levels increased in Mexican plants, the perceived need for plants on the U.S. side declined. Currently about five thousand El Pasoans either support maquiladoras in El Paso or work in Juárez plants. *Maquiladoras* are the second largest generator of foreign exchange (behind petroleum) in Mexico. A great deal of commercial development on both sides of the border is financed by Texas banks and holding companies. El Paso banks are said to hold hundreds of millions of dollars from Mexican depositors (Hirsch 1987; Martinez 1994).

El Pasoans shop in Juárez, and Juárenses shop in El Paso (Resendiz 1993). The Greater El Paso Chamber of Commerce estimates Mexican shoppers account for more than $1 billion dollars a year in El Paso

retail sales. After the 1982 peso devaluation, retail sales fell 42 percent in El Paso (Institute for Manufacturing and Materials Management 1991). One Juárez businessman is establishing a company to help finance loans to facilitate Mexican purchases of automobiles in El Paso. Currently, according to some El Paso car dealers, Mexicans account for up to 10 percent of their sales, but most pay cash because of the difficulties of arranging loans internationally (Olvera 1992a). Mexican capital also plays an increasingly important role in the El Paso economy. The Westin Hotel in downtown El Paso was recently purchased by the Mexican El Camino Real chain, for example, and the Cielo Vista Mall is owned by investors from Chihuahua City.

Geographical and climatic conditions combine to funnel migrants into, rather than around, El Paso. The rugged terrain and desert conditions provide little respite for weary foot travelers. The climate of the region can be harsh. Summers are hot and dry. Temperatures regularly climb above 100 degrees during the summer, and annual rainfall is less than 10 inches. Winters can be equally harsh, with cold temperatures exacerbated by high winds. Water is a scarce commodity. Another factor that funnels migrants into El Paso is that only in the city can one find ground and air transportation. Consequently, immigration officials conduct random vehicle checks and patrol the airport, bus terminals, and train depots for illegal migrants. Railroad tracks run within fifty feet of the border west of El Paso outside Sunland Park, New Mexico. Anapra, the Mexican squatter settlement immediately across the border from Sunland Park, is situated within 100 yards of the tracks and is a staging area for migrants and others to hop west-bound freight trains.

Legal Nonimmigrant Border Crossings

The harsh terrain around El Paso, the generally long distances to other cities, and the lack of sufficient numbers of agents, help to account for the prior Border Patrol strategy of emphasizing interception of undocumented migrants after entry rather than deterrence before entry. This strategy allowed relatively easy entry into the city on the part of illegal crossers not intending to move on to other locations. The new strategy, by contrast, seeks to discourage all illegal crossers whether their destinations are local or some distance from El Paso. But what kinds of crossers are most affected by the new strategy? This requires understanding who is *not* affected, that is, understanding who can cross legally and under what circumstances. Federal immigration law, as given in Title 8 of the *Code of Federal Regulations*, has established many different categories of nonimmigrant visas for foreign citizens who wish to visit the United States on a nonpermanent basis. Nearly all of these categories require the visitor to be the bearer of a valid passport from his/her country and to apply for the visa at a U.S. consulate in that country. Such persons can, of course, enter the country legally.

There are also other categories of persons who can enter legally. One category of nonimmigrant visa is the Mexican Border Crossing Card [BCC][3] held by thousands of Mexican citizens residing in Ciudad Juárez and other Mexican border cities. Bearers of the BCC, which has no expiration date, are entitled to admission to the United States "as a border crosser or nonimmigrant visitor for a period not to exceed 72 hours to visit within 25 miles of the border" (CFR, Title 8, § 235.1). The BCC may be issued to Mexican residents by officers of the INS at official U.S. ports of entry located on the southern border. A recipient of the BCC need not bear a valid Mexican passport but may instead present proof of his/her Mexican residency by presenting a valid Mexican Form 13, also known as the *pasaporte provisional* (CFR, Title 8, §212.6). As is the case with any other nonimmigrant visa, applicants for the BCC must demonstrate that they do not intend to abandon their Mexican residence in favor of residence in the United States and that they do not intend to seek employment in the United States (CFR, Title 8, §1184 (b)). As is the case with any visa, whether immigrant or nonimmigrant,

[3] The Border crossing card is known by several names to Juárez residents: *pasaporte local*, *mica*, and *permiso de cruce*. The BCC is not to be confused with the *tarjeta verde* [green card] held by legal permanent residents of the United States, or with the *pasaporte provisional* (or Mexican Form 13), which is one of the documents applicants must present in order to be issued a BCC.

applicants for the BCC must demonstrate that they are "not otherwise inadmissible" to the United States (CFR, Title 8, §212.6), i.e., that they are not members of a class of "excludable aliens" under CFR, Title 8, §1182 and have not broken any other U.S. immigration laws.[4]

The existence of the BCC both reflects and facilitates the historical economic and social integration of border "twin" cities like Ciudad Juárez and El Paso. Juárez residents who possess the BCC use it to pass freely back and forth between El Paso and their city to conduct all sorts of personal affairs—to shop, pay social visits, change currency, deposit money in U.S. banks, attend cultural and sporting events, receive medical services (including to give birth), go out to eat. Many also use the BCC to conduct business—to meet with business or trading partners, purchase supplies, deliver orders of goods produced or assembled in Mexico, use communications, financial, or repair services, and, in some cases (illegally), to go to work. The city of El Paso is economically dependent upon Mexican nationals for dollars spent on personal consumption as well as other kinds of business transactions in El Paso, both of which serve to integrate the economies of the United States and Mexico. Without the free, legal, and routine cross-border movement of thousands of Mexican nationals facilitated on a daily basis by the BCC, the El Paso economy clearly would be adversely affected. While no current figures on the number of Juárez residents who hold the BCC are available,[5] it seems safe to say that most of the millions of legal border crossings made by Mexican nationals between Juárez and El Paso each year are made by BCC holders.[6]

Both the BCC and the Mexican Form 13 are issued free of charge to the applicant. There is no legal limit on the number of BCCs that may be issued. Given the apparent ease of meeting the requirements, the lack of a prohibitive charge for processing documents, the fact that as many people may be issued the BCC as apply for it, and its obvious utility to the bearer, why would anyone choose to cross the border illegally when it appears to be easy to cross legally? One reason is that, while the BCC can be used to cross the border legally, it does not confer the right to obtain employment in the United States. Illegal workers often do not wish to expose themselves to possible detection by U.S. immigration authorities who inspect entrants at official ports of entry to the United States. Moreover, many long- and short-term residents of Juárez have little hope of obtaining a BCC and must resort to illegal border crossing if they wish to avail themselves of opportunities for consumption and employment on the U.S. side of the border.

A second, and probably more significant, reason is that obtaining a BCC can be a time-consuming and complicated process. Many border residents are unable to obtain the BCC because of the way the INS interprets its legal mandate to determine which applicants for admission to the United States are eligible for nonimmigrant visas (CFR, Title 8, §1184 (b)) and which applicants belong to classes of excludable aliens (CFR, Title 8, §1182). The law grants a great deal of discretion to the INS at every level of its hierarchy, from the Commissioner, to District Directors, to port of entry Inspectors in making these determinations. For most practical purposes the answers to these questions hinge on whether the applicant, in the estimation of the INS, is financially

---

[4] An additional requirement, although it does not seem to be specified in the *Code of Federal Regulations*, is that the applicant be a resident of a Mexican border city. Mexican nationals residing in cities in the Mexican interior may be awarded multiple entry, nonimmigrant visas with similar privileges and limitations as the BCC, but these visas must be issued by a U.S. consulate and be stamped on a valid Mexican passport. As a practical matter, this is sensible: the BCC is a wallet-sized card designed to be carried at all times by persons who cross the border routinely; residents of Mexican interior cities would seem to have less need for such a special document.

[5] Because the BCC is issued without a fixed date of expiration, it is difficult to know how many valid BCCs are currently in circulation.

[6] In 1993, 5,891,625 northbound pedestrian and 15,466,202 northbound vehicle crossings were made across the border into El Paso. Figures are not kept regarding the nationality or place of residence of crossers, however. Nonetheless, it seems safe to say from qualitative observation that the majority of crossers, both vehicular and pedestrian, are Mexican residents.

solvent. Applicants who are financially solvent, based on their employment or their assets, are thought to be less likely to be immigrants posing as temporary visitors to the United States. Their solvency helps to demonstrate their claim of eligibility for a nonimmigrant visa such as the BCC. It also helps demonstrate they do not belong to the three classes of excludable aliens: (1) paupers, professional beggars, or vagrants; (2) persons seeking to enter the United States to perform skilled or unskilled labor; and (3) persons who are likely to become "public charges" (CFR, Title 8, §1182 (a)).[7] INS officers, according to the relevant statutes, may require entrants to answer questions regarding their solvency or present written documentation thereof (CFR, Title 8, §1225 (a)). Failure on the part of applicants to provide such answers/evidence at the time of application constitutes sufficient grounds for denying issuance of the BCC. Failure to provide such requested information to an INS officer when using the BCC for entry can result in its confiscation and revocation.

There is a high degree of consistency among the Brownsville, Laredo, and El Paso district ports of entry in the documents that applicants for the BCC must present to demonstrate their Mexican residency and financial solvency, although BCC application and issuance administrative procedures vary from district to district. In El Paso, the INS distributes mimeographed fliers in Spanish at the ports of entry at Ysleta, the Bridge of the Americans, and the Paso del Norte Bridge that list the documents BCC applicants are required to present. An English translation of this flier is presented in **Table 1**. All applicants for the BCC must present either a valid Mexican passport or a provisional passport known as the Form 13. In practice, most BCC applicants obtain the Form 13 from the *delagación* of the Mexican federal government next to the Paso del Norte Bridge in downtown Juárez. The Form 13 is issued free of charge to all applicants who present two photographs and the required documents, which include a valid birth certificate and two proofs of residency issued at least six months prior to the time of application, from among the following:

- Receipts from gas, electricity, and telephone bills, or title to land;
- Proof of Mexican Social Security registration;
- Voter registration card;
- Driver's license;
- Rent receipts.

In addition to the Form 13, the INS, in its flier, asks applicants to bring with them utility receipts in their name to demonstrate further their Mexican border residency.

To demonstrate financial solvency, the INS asks BCC applicants who are employees to present original pay stubs demonstrating their employment over the last twelve months, a letter from their employer verifying their employment, as well as proof of Mexican Social Security registration and bank account statements. Business people, professionals, farmers, and ranchers must similarly document stable sources of income or assets. Children and the elderly must demonstrate solvency based on the income/assets of the persons who support them. Upon obtaining their Form 13 and getting together the documentation requested for proving Juárez residency and financial solvency, BCC applicants line up at 4:00 A.M. on Wednesday mornings on the Mexican side of one of the bridges spanning the Rio Grande to cross to the INS port of entry office and request an application appointment with an INS officer the following week. If the INS officer approves their application at the time of that appointment, applicants are issued a temporary BCC which they may begin to use immediately to enter the United States. They may then pick up their permanent BCC in approximately six months at the Bridge of the Americas port of entry.

In sum, a number of obstacles must be overcome to obtain legal border crossing cards. Many Juárez residents think they are not able to satisfy the INS desire for documentation of their employment and income and self-select themselves out of the application process. [The reasons for this are discussed in more detail in Chapter VIII.] Long waits in line on

[7] Other classes of excludable aliens are not terribly common in the general population: the mentally retarded; the insane; drug addicts; convicted or confessed criminals; polygamists; prostitutes; etc.

Table 1.

REQUIREMENTS FOR PROCESSING APPLICATION FOR CROSSING CARD
(*PASAPORTE LOCAL*)

A. Form 13, or a valid provisional or international passport.
B. Two individual, color photographs, 3/4 profile, untouched, with the right ear uncovered, against a white background, for each applicant (regardless of age).
C. If the person applying for the permit does not work, the person supporting him/her must come to this office and personally present documents demonstrating his/her employment (economic solvency).
D. All applications for permits are processed individually, regardless of the age of the applicant. Dependent children of any age must present their birth certificates, 2 photos, and must also appear in this office; they must also present the documents listed above with letter "A," and bring with them the person who supports them economically.
E. Women may no longer bring children with them to be added to their MICA. Children must appear with the requirements mentioned above in letter "D".

PROOF OF RESIDENCY: Receipts in your name for electricity, water, telephone, gas, etc.!!!

REQUIREMENTS TO PROVE ECONOMIC SOLVENCY

1. EMPLOYEE/WORKER—You must present paycheck stubs, or receipts for salary or payroll (photocopies are not acceptable) for an entire year. A letter from your employer on official stationery that indicates how long you have been working, if the position is permanent, and the salary you receive. Social Security Card, bank account, or savings account. Any other evidence that you judge to be important for demonstrating your economic solvency.
2. BUSINESSPERSON—You must present your City License, annual receipts for taxes collected by the federal government, receipts for business purchases, taxpayer ID number, bank account, Social Security registration, and a copy of the list of employees officially on your payroll.
3. FARMER/RANCHER—You must present the title(s) to your land, tax receipts, taxpayer ID number, cédula cuarta, official registration of your crops from the Agency of the Secretariat of Agriculture and Ranching with official seals, plus the registration of your cattle brand, if you are a rancher.
4. PROFESSIONAL—City license, tax receipts, bank account, credit cards. Professional ID card.
5. STUDENT—You must present your student ID and a letter from your school showing that you study there year-round. In addition, the person who supports you economically must come to this office with the documents mentioned above with regard to his/her employment (economic solvency).
6. OTHER APPLICANTS—Those persons not mentioned above, for example pensioners and older persons may present the person who supports them economically or whatever else they consider pertinent to their economic solvency.

PLEASE NOTE: Whether or not your application is approved by the inspector who interviews you depends in large measure upon the presentation of all the documents mentioned above.

workdays to be issued the Form 13, a night-time and early-morning wait on the bridge to be given an application form and appointment date, and a third wait on the appointed day in the INS port of entry office all help to deter applicants who have doubts about their likelihood to be approved for permission to cross the border.

Moreover, the INS only processes a fixed maximum number of applications per year, although in principle there is no limit on the number of BCCs that may be issued. According to the chief inspector at the Paso del Norte port of entry, before the Operation began, his staff processed a maximum of 250 individual BCC applications per week.[8] From the start of the Operation through the month of October 1993, the number of applications processed was increased to 750 per week to handle an expected rise in demand for new or replacement BCCs as a result of the new border control strategy. In November, the *status quo ante* was resumed. The reason for this limit, according to INS officials, is that they lack sufficient resources to process more BCC applications without increasing the backlog of applications they receive for legal permanent residence. This accounts for the long and, in the past, often unruly queues formed on the Mexican side of the international bridges on the nights before the INS gives out BCC interview appointments. The cap also makes it impossible to gauge the true demand for the BCC on the part of Juárez residents.

The phenomenon of illegal border crossings in El Paso thus cannot be divorced from the issue of how Juárez residents become legal border crossers. The inconvenience of obtaining the necessary documents, BCC eligibility criteria that deter many people who in principle might qualify, the need for processing more BCC applications per year, and the previous allowance of relatively easy entry into El Paso of illegal crossers all combined prior to the Operation to encourage illegal crossings. Other factors discussed below also encourage illegal crossings. Thus, given that many persons have reasons to want to cross the border, given the deterrents that exist to obtaining BCCs in order to cross legally, and given that the Border Patrol's first line of defense was easily penetrated, many Juárez residents chose to make routine illegal crossings (while many more simply abstained from the opportunity). Such crossings helped to create the appearance that the Border Patrol had lost control of the border in the El Paso district and provided much of the impetus for launching Operation Hold the Line.

III. Effects on Illegal Flows

The major reason for conceiving and implementing Operation Hold the Line was to curtail illegal entry into El Paso (and through El Paso into the United States). This chapter seeks to ascertain the degree to which that objective has been achieved. Given the interconnection between legal and illegal border crossings in El Paso, it also seeks to gauge the Operation's effects on legal crossings. As noted above, understanding the effects of the Operation on border crossings requires a recognition that there are many different reasons for crossing and that either legal or illegal means may be used to achieve various crossing objectives. This means that it is useful to consider a taxonomy of different kinds of crossers. Just as it has been useful to consider different kinds and national origins of illegal entrants to the United States in estimating the magnitude of stocks and flows of illegal migrants (Bean, Edmonston & Passel 1990), so, too, is it useful to consider different kinds of crossers to assess the effects of Operation Hold the Line on El Paso / Juárez.

Two major distinctions among kinds of crossers are important at the outset: between legal and illegal crossers; and between long-distance and local migrants (or crossers). When combined with certain other characteristics of crossers, these distinctions yield eight possible kinds of crossers (see **Table 2**). One (illegal long-distance labor migrants) consists of persons who cross illegally with the intention of moving on to other destinations in the United States to find work. A second (illegal crossers / illegal work-

[8] Many applications are to replace lost or damaged cards or to issue cards with photos that better reflect a person's current appearance. Further, the number of individual applications processed is somewhat less than the number of application interviews conducted, as INS inspectors typically interview entire families together.

Table 2.

A TYPOLOGY OF MEXICAN BORDER CROSSERS IN EL PASO/JUÁREZ

	Crosses		Works in El Paso			Other Legal Activities in El Paso			Criminal Activities
Type	Legally	Illegally	Legally	Illegally	Doesn't work	Shopping	Social Visits	Services	in El Paso
Illegal Long-Distance Labor Migrants		+			+				
Illegal Crossers/ Illegal Workers		+		+		+	+	+	
Local Juvenile Crossers		+			+		+		+
Legal Crossers/ Illegal Workers	+			+		+	+	+	
Illegal, Nonlabor Crossers		+			+	+	+	+	
Legal Temporary Crossers	+				+	+	+	+	
Legal Crossers/ Legal Workers	+		+			+	+	+	
Lives in El Paso Illegally	+		+		+	+	+		

ers) consists of persons who cross illegally to seek work or to set up street vending operations. A third (local juvenile crossers) consists of persons (mostly teenage males) who cross illegally to hang out, have a good time, or just have the experience of crossing. Much of the petty vandalism often attributed to migrants may be committed by this type of crosser. A fourth ("legal crossers/illegal workers") consists of persons who cross legally using *mica* cards (the local resident commuting card) but who work illegally as maids, gardeners, or other kinds of workers in El Paso. A fifth (illegal nonlabor crossers) consists of persons who cross illegally to engage in some nonwork-related activity, including shopping, visiting friends and relatives, and seeking medical services. A sixth (legal temporary crossers) consists of persons who cross legally (using the *mica* card) to pursue a similar variety of legal activities. A seventh (legal crossers/legal workers) consists of U.S. citizens living in Juárez, or legal long-distance labor migrants, for example. An eighth (illegal residents) consists of persons who live illegally in El Paso and cross into the United States illegally upon returning from visits with friends and family in Mexico.

Operation Hold the Line can affect different types of crossers differently. Long distance labor migrants, who for example, may be strongly motivated to find a way to enter despite any increased efforts at deterrence, may have been inconvenienced but not substantially deterred by Operation Hold the Line. To determine if such crossers seek simply to go around the end of the line outside of El Paso or cross into the United States at other points along the border where surveillance is less intense, month and sector-specific apprehensions data were analyzed. To see if persons crossing illegally to work in El Paso may have changed their crossing patterns and the duration of their stays as a result of the Operation, daily and weekly data on northbound and southbound bridge crossings were looked at. In both cases, the different effects on different kinds of crossers were considered.

Apprehensions Data

To assess whether the occurrence of some event or the change in some policy or strategy (such as the change in border control strategy that accompanied Operation Hold the Line) affects some outcome variable, it is useful to examine data that permit comparisons of the key variables designed to be affected by the change in time periods before and after the change. Such comparisons provide approximations of natural experiments, but because one can never be sure that factors other than the one of interest are not accounting for postevent changes in the variable of interest, they have been termed "quasi-experiments" (Campbell & Stanley 1966). Such quasi-experimental designs have been usefully employed to study the effects of the 1986 Immigration and Reform Act [IRCA] on changes in illegal flows (Bean, Edmonston & Passel 1990; Donato, Durand & Massey 1992).

To assess whether illegal flows into El Paso were curtailed by Operation Hold the Line, U.S. Immigration and Naturalization Service apprehensions data, which are counts of the number of times persons entering the country illegally are apprehended by the Border Patrol or other INS enforcement personnel within a given period, were examined. The primary research strategy was to develop and estimate the parameters of a statistical model that incorporates post-Operation dummy variables, as well as time trend, seasonal, and enforcement effort variables, that might be thought to influence variation in apprehensions across months. Estimates of coefficients for post-Operation dummy variables were used to infer whether the variation in illegal flows had been affected by the Operation.

Some observers suggest that such data are not particularly useful because some persons are apprehended more than once; others imply that such data, when multiplied by a factor to take into account the number of crossers going unapprehended, indicate the number of illegal aliens residing in the country who entered at the border. One view totally rejects apprehensions data; the other accepts them at face value. While apprehensions data have well-known limitations, they provide a reflection—although only a partial one—of the volume of illegal crossings and are particularly useful for indicating periodic changes in the number of such crossings, especially to the extent that it can be assumed over time that there is

a fairly constant relationship between crossers and apprehensions (Espenshade 1990).

The total number of INS apprehensions occurring in a given year results from activities undertaken by both the Border Patrol, the main enforcement arm of the INS, and the Investigations Unit, the entity responsible for interior operations. Most of the illegal aliens apprehended in the United States are arrested by the Border Patrol; most are caught near the U.S/-Mexico border; and most entered the United States without inspection by the INS. Data for FY 1992 are instructive (U.S. Immigration and Naturalization Service 1993). First, of the 1.26 million apprehensions made in that year, 1.22 million were credited to the Border Patrol; the remaining 46 thousand to the investigations unit. Second, the INS is divided for administrative purposes into four regions and thirty-three districts. Five of these districts touch the 1,900-mile southern border with Mexico (El Paso, Harlingen, and San Antonio in the state of Texas; Phoenix in Arizona; and San Diego in California). Together, these five districts accounted in 1992 for nearly 98 percent of all aliens deported or required to depart. Third, 97 percent of all apprehensions in 1992 involved aliens who entered the country without inspection (a majority of illegal aliens, however, are visa-overstayers rather than persons entering without inspection (Bean, Edmonston & Passel 1990). The small remaining fraction of apprehensions consisted of persons who entered with fraudulent documentation, or who entered legally but subsequently violated the terms of their visa by, for example, accepting unauthorized employment or overstaying the length of their visa (Levine, Hill & Warren 1985).

There are two types of INS Border Patrol apprehensions at the U.S./Mexico border—linewatch and nonlinewatch. The former result from time spent guarding the border against smuggling and illegal entry of aliens. They include apprehensions by Border Patrol agents engaged in surveillance, tower watch, foot, horseback or vehicle patrol, as well as other operations designed to prevent illegal entry. As implied by the nature of the activity, nearly every linewatch apprehension (roughly 97 percent) is of a person apprehended trying to enter the United States without appropriate entry documents. Nonlinewatch operations involve several kinds of activities, including farm and ranch checks, traffic checks, transportation checks, city patrols, and other activities.

In examining linewatch and nonlinewatch apprehensions, the former may provide a somewhat better basis than the latter for assessing changes in the flow of illegal migrants over a given period of time for two reasons. First, linewatch apprehensions occur very close to the border and do not involve the different kinds of enforcement activities that are involved in nonlinewatch apprehensions and are thus less likely to fluctuate over time as a consequence of changing Border Patrol enforcement strategies (North 1988; Bean, Vernez & Keely 1989).

Second, only about one out of every seven nonlinewatch apprehensions occur at entry, unlike almost 98 percent of linewatch apprehensions. One-fourth of nonlinewatch apprehensions are of persons who have been in the country four days or longer, with the numbers varying considerably depending upon the method of apprehension. This fraction tends to be even higher in the case of all categories of nonlinewatch activity except traffic and transportation checks. The change over time in nonlinewatch apprehensions may reflect changes in the stock of illegal immigrants, in enforcement strategies, and in the flow of undocumented migrants. Variations may also occur because of changes in the number of linewatch apprehensions (i.e., the more successful the Border Patrol is in catching persons upon entry, the fewer numbers will be at risk of being apprehended as a result of nonline-watch activities).

Information on changes in the number of Border Patrol linewatch and nonlinewatch apprehensions thus provides a partial basis for assessing whether the monthly number of illegal southern border crossings into the United States (or the magnitude of the flow of undocumented migrants) has changed since Operation Hold the Line began. This change was assessed using time-series analyses of linewatch and nonlinewatch apprehensions data from FY 1989 through April of FY 1994. To be most useful for

assessing the degree to which Operation Hold the Line has affected the nature and degree of illegal border crossings into the United States, apprehensions data must be "freed" of other factors that influence their magnitude, including those that have nothing to do with the Operation; it is necessary to control for the influence of time trend, seasonal factors, enforcement effort, and serial correlation.

Moving from West to East, the U.S./Mexico border is divided into nine Border Patrol sectors—San Diego, El Centro, Tucson, Yuma, El Paso, Marfa, Del Rio, Laredo, and McAllen. As of the date of this writing, data were obtainable on only apprehensions and enforcement hours through April for FY 1994. **Table 3** shows the average monthly values for both linewatch and nonlinewatch apprehensions and enforcement hours for the first seven months of FYs 1993 (October 1992-April 1993) and 1994 (October 1993-April 1994). The latter period encompasses almost the entire time of Operation Hold the Line, which began in late September 1993. At this point only data for the first seven months of FYs 1993 and 1994 were examined to ensure that comparison of the same months across the two years, a strategy necessitated by the strong seasonal pattern of illegal flows (and thus apprehensions) into the United States (Bean, et al. 1990).

The average gross number of apprehensions along the entire U.S./Mexico border declined by nearly 12,000 per month from FY 1993 to FY 1994 (from about 66,300 to about 54,500 per month). Most of this decline occurred because of the sharp drop in the El Paso sector (see second line, **Table 3**), where apprehensions dropped by more than 10,000 per month. The dramatic effects of Operation Hold the Line can also be seen in the steep drop evident for the post-Operation months in **Figure 1**. Thus, as measured in these terms, Operation Hold the Line clearly has reduced the number of linewatch apprehensions in the El Paso sector substantially and, by implication, the flow of illegal crossers into the United States.

The patterns for enforcement hours and nonlinewatch apprehensions also indicate, however, that this may have occurred to some extent at the price of nonlinewatch apprehensions. Prior research has shown that both linewatch and nonlinewatch apprehensions vary directly with enforcement hours (Bean, Edmonston & Passel 1990; North 1988), a relationship that derives from the enforcement strategy followed by the Border Patrol of trying to intercept aliens after entry. Thus, the results shown in Table 3 indicate that, except in the El Paso sector, apprehensions generally go up when enforcement hours rise and generally decline when hours drop. The Operation Hold the Line change in strategy, however, turned this relationship upside-down. By stationing agents at the border to prevent illegal entries before they occur, fewer apprehensions are made because fewer illegal crossings occur. Thus, while linewatch enforcement hours more than doubled during the Operation in comparison to the same months of the previous year (from 32 thousand per month to almost 67 thousand per month), apprehensions in the El Paso sector dropped to less than one-fourth of their previous level.

It is also the case that the increase in linewatch hours at the border was achieved in part by reassigning agents, resulting in the 42.8 percent decline in nonlinewatch enforcement hours in the El Paso sector (from about 41,000 per month in FY 1993 to about 23,400 per month during FY 1994, when Operation Hold the Line was in force). Given that fewer illegal aliens were getting through the initial line to begin with, nonlinewatch apprehensions declined disproportionately (by 70.6 percent). However, some of the decline in nonlinewatch apprehensions is undoubtedly due to the shift from nonlinewatch to linewatch activities.

That Operation Hold the Line reduced apprehensions is also revealed in an examination of changes in the number of apprehensions per hour (**Table 4**). From the same months in FY 1993 to the Operation months in FY 1994, the number of apprehensions per hour in the El Paso sector declined by 87 percent (from 0.45 per hour to 0.06 per hour). A smaller decline (about 50 percent) occurred in the case of nonlinewatch apprehensions. In all other groupings of sectors except California, and in the case of both linewatch and nonlinewatch apprehensions, the average number per hour increased slightly. This sug-

Figure 1.

gests that illegal flows might be increasing in sectors outside the El Paso corridor although, as noted below, analyses that control for additional variables are required before this hypothesis can be assessed more fully. The numbers for California, however, behave somewhat differently than those for other sectors, perhaps because of the slump in the California economy over the past three years and because of the January 1994 Los Angeles earthquake that undoubtedly affected the flow of illegal migrants, at least in the short term.

As suggestive as these results are, they are limited because they are gross figures that do not control fully for time trends in apprehensions, seasonal factors, enforcement hours, and serial correlation. Even though the above comparisons of apprehension statistics before and after the Operation seek to adjust for seasonal variations by comparing the same months of FYs 1993 and 1994, they are based on only one year's pre-Operation experience. (The strong seasonal pattern of apprehensions is evident in **Figure 1**.) Moreover, they do not remove the effects of long-term trends. To control better for time-trend and seasonality, time-series analyses were undertaken of monthly linewatch and nonlinewatch apprehensions data beginning with FY 1989 and running through April 1994, a total of sixty-seven months. Because ordinary least squares estimates with time-series data typically exhibit serial correlation in the residuals, we estimate the effects of the independent variables with a procedure that adjusts for serial auto-correlation (SPSS 1993). Tests for first and higher-order terms indicated that a first-order auto regressive term was sufficient to capture the serial correlation (Pyndyck & Rubinfeld 1991). The models are estimated for various border sector groupings (all sectors, all but El Paso, El Paso alone, the Arizona sectors, the California sectors, and the Texas sectors excluding El Paso). Independent variables are included for long-term trend (measured as the month in the series), seasonality (measured as dummy variables for months in the year, with December deleted from the model), enforcement hours (measured as monthly linewatch or nonlinewatch hours respectively), and dummy variables for two post-Operation periods, the first four months after the Operation (October-January) and the following three months (February-April). The post-Operation dummy variables thus measure the average monthly increase or decrease in linewatch (or nonlinewatch) apprehensions for the early or late Operation period compared to the average in the five preceding fiscal years, net of the effects of seasonality, time trend, serial correlation, and enforcement hours.

The results of such models can help answer several questions. First, the findings for the El Paso sector are relevant to the assessment of the extent to which Operation Hold the Line reduced illegal flows into the El Paso sector beyond any changes associated with the influence of other factors. The time-series results thus provide a stronger basis for making this assessment than the single-year comparisons discussed above. Second, the findings for sectors other than El Paso are relevant to assessing the extent to which rumors might have spread throughout Mexico that the crackdown was being extended to other sectors, thus exerting a deterrent effect on illegal migration flows into other sectors besides El Paso. If this had occurred, one would expect to observe declines in apprehensions (especially linewatch apprehensions) immediately after the Operation, with these declines dissipating as such a shakedown period moved to its termination. Third, the findings are relevant to the assessment of the extent to which net illegal flows into sectors other than El Paso have been increasing over time, perhaps as a result of the diversion of long-distance labor migration from El Paso to other sectors.

The results of the time-series regressions are shown in **Table 5**. Coefficients are shown here only for enforcement hours and for the early and late post-Operation periods. Coefficients for the other variables (the time trend variable and the seasonal dummies) are omitted to improve clarity of presentation. The first column shows the results for the entire U.S./Mexico border. It indicates that in the first four months of the Operation, linewatch apprehensions —net of time trend, seasonality, enforcement hours, and serial correlation—were down by a small amount for the entire border. In the next three months net apprehensions increased considerably—by more than 2,700 per month. Comparison of columns two and three indicates the extent to which El

Paso and the rest of the border sectors contributed to this overall pattern. While net monthly apprehensions were steeply reduced in El Paso, net apprehensions increased across all other sectors. In short, some of the decrease in apprehensions that occurred in El Paso appears to have been offset by increases in other sectors.

A comparison of the early and the late post-Operation effects indicates that the deterrent effect of the Operation on apprehensions appears to lessen as more time elapsed. Comparing the late to the early period effects in El Paso indicates that the decrease in net apprehensions lessens (although it remains substantial), falling from a decrease of about 7,800 to a decrease of about 7,030, a decline of almost 10 percent. At the same time, however, increases occurred in the Arizona, California, and Texas sectors. Proportionally, these were especially large in Arizona. By the late period (February-April), nearly one-half of the El Paso decline was offset by increases elsewhere that were occurring net of time trend, seasonal factors, and differences in enforcement hours. Net apprehensions increased in the post-Operation period, even though gross apprehensions decreased somewhat, indicating that the gross decreases observed in California would have been even greater had the California figures not been pushed upward (net of time-trend, seasonality, enforcement hours, and serial correlation) in the post-Operation period.

Thus, net apprehensions were up throughout the post-Operation period in California, and they were up substantially more in Arizona late in the period. These patterns are consistent with the belief that part of the illegal flow from throughout Mexico to the United States (probably long-distance labor migration) tends to get routed through two major ports of entry, El Paso and Chula Vista. If one of these ports is closed off, some of this flow may be diverted to the other port. Thus, while net linewatch apprehensions were down substantially in El Paso, they were up in California. Another part of the illegal flow is probably more regionalized, perhaps with respect to both the origins and destinations of migrants. With the El Paso port of entry closed down, some of this flow gets diverted to the most geographically proximate sectors (Arizona), and a lesser portion to the next most proximate sectors (Texas). These sectors showed an increasing number of apprehensions moving from early to late in the Operation. Thus, overall, the Operation appeared to continue to depress flows into El Paso as time elapsed (although at a decreasing rate), but nearly one-half of this decrease was offset by increases in flows over time to other sectors (at an increasing rate in the Arizona and Texas sectors).

In nonlinewatch apprehensions (**Table 3**), the most notable pattern is a decline during the late post-Operation period in the cases of all sector groupings. There are two plausible explanations: first, it is possible that the below average levels of apprehensions in the months right after the blockade means that there were fewer illegal migrants around in subsequent months to be apprehended in nonlinewatch locations; second, as nonlinewatch enforcement hours fell in the later months, there were probably disproportionately fewer apprehensions may have taken place because so few agents were pursuing illegals. Thus, the numbers of apprehensions may have dropped to a greater degree than did the number of hours. More research will be required to ascertain whether, and to what degree, these explanations are correct, or whether there is some other explanation.

Bridge Crossing Data

Mexican commuter workers are one of the major groups of border crossers who have been affected by Operation Hold the Line. Commuter workers live in Juárez but regularly cross the border to work in El Paso or in other nearby communities in Texas and New Mexico. They may cross daily, weekly, or less frequently depending upon the terms of their employment in the United States and whether they maintain residences on both sides or only on one side of the border. The legal status of these Mexican commuters in the United States varies. For analytical purposes, it is useful to classify commuters into four legal-status categories:

U.S. citizens: Mexican residents who were either born in the United States or who became naturalized citizens at an earlier point in their lives. These persons may choose to live in Mexico for a variety of reasons, including family ties, cultural preferences, and a lower cost of living in Juárez. As U.S. citizens, they have the legal right to both enter the United States and find employment here.

Work-permit holders: Mexican residents who have a visa that permits them to seek employment in the United States. This group includes legal permanent residents of the United States who maintain a residence in Mexico. Like U.S. citizens, members of this group legally enter the United States. These commuters are sometimes referred to as green carders.[9]

Border Crossing Card holders: Mexican residents who have been issued a special nonimmigrant visa by the U.S. Immigration and Naturalization Service that allows them to enter the twelve-mile strip of the United States along the Mexican border for periods of up to seventy-two hours for purposes of tourism, shopping, and conducting other kinds of personal business. Holders of the Border Crossing Card [BCC]

[9] See Martinez' *Border Boom Town* for an historical discussion of Juárez "green card" workers (Martinez 1975). Also, see North's (1970) Department of Labor report on Mexican commuter workers.

sometimes cross the border into the United States legally in order to work illegally.[10] The Border Crossing Card is known by several names in Juárez, including *pasaporte local*, *mica*, and *permiso de cruce*.

Undocumented commuters: Mexican residents who lack any kind of passport or visa that grants them the right either to enter or work in the United States. These commuters cross the border illegally, either away from legal ports of entry or with false documents, and may work illegally as well.

Table 6 summarizes these categories of commuter workers and classifies them by legal status with regard to entry and employment. No institution in the United States or Mexico regularly collects data on Mexican commuter workers. It is therefore impossible to make precise estimates of the number of persons in each commuter category. We attempt a rough estimate of the size of each category by taking the results of three separate data collection efforts conducted on the Mexican side of the border between 1987 and 1990 and imputing these findings to the 1993 Juárez population.

To estimate the size of each commuter category requires an estimate of the size of the economically active population of Juárez in 1993. According to the 1990 Mexican Census of Population and Housing, the total population of the *municipio*[11] of Juárez was 798,499 persons. According to census reports, the economically active population[12] of Juárez in 1990 was 286,683. Between 1970 and 1990, the total population of Juárez grew at an annual rate of 3.2 percent. If that rate of growth remained constant, and if we assume, for practical purposes, that the growth rates for the total population and the economically active population were approximately equal, by the end of 1993 we would expect the total population of Juárez to be 877,900 persons, and the economically active population to be 315,351.

[10] Under situations of easy illegal border-crossing (as seems to have been the case prior to Operation Blockade), some BCC holders may in fact enter the United States illegally, away from legal ports of entry, for several reasons: a) to avoid paying bridge tolls; b) to minimize detection as illegal workers and confiscation of their BCC; or c) to avoid long bus rides from outlying areas of Juárez to official ports of entry to the United States, as in the case of residents of Rancho Anapra who regularly walked across the 100 yards of desert separating them from Sunland Park, New Mexico.

[11] The term *municipio* in Mexico corresponds roughly to county in the United States. It is the closest equivalent to the U.S. census designation metropolitan statistical area that is reported by the Mexican statistical agency INEGI.

[12] Those persons fifteen years of age or older who were employed or seeking employment at the time the census was taken.

Table 6.

LEGAL STATUS CATEGORIES OF MEXICAN COMMUTER WORKERS

Commuter	Enters United States		Works in United States	
	Legally	Illegally	Legally	Illegally
U.S. Citizen	+		+	
Work Permit	+		+	
BCC Only	+			+
Undocumented		+		+

The Mexican statistical agency, *INEGI*, conducts a quarterly urban labor market survey similar to the United States Current Population Survey. Questions included in the survey, the *Encuesta Nacional de Empleo Urbano* [*ENEU*], ask respondents where they worked during the preceding week. In the fourth quarter of 1989 (the latest data available), *ENEU* results indicated that 4.8 percent of the economically active population had worked in the United States in the week preceding the survey. In other words, 4.8 percent of the working people in Juárez at the end of 1989 commuted from their residences in Juárez to jobs in the United States at least once a week. If we assume that the proportion of working people in Juárez with jobs in the United States remained constant through 1993, we arrive at an estimate of 15,137 cross-border commuter workers residing in Juárez at the time of Operation Hold the Line.

Lamentably, the *ENEU* survey does not include a classification of commuter workers by their legal status in the United States. To our knowledge, only one survey has ever been conducted in Juárez that collected this information. In 1987, the *Colegio de la Frontera Norte*, a research institute based in Tijuana, Baja California, conducted the *Encuesta Socioeconómica Anual de la Frontera* [*ESAF*],[13] which collected a wide range of data on 605 households in Juárez, including the legal status of commuter workers. Results of the *ESAF* with regard to commuters were reported in an article published by Tito Alegría (Alegría 1990) in the journal *Frontera Norte*. Alegría's first finding of interest was that 6 percent of Juárez workers were either U.S. citizens or legal permanent residents of the United States; 48 percent had a border crossing card or other type of visa that allowed them to enter the United States legally, but not to work in the United States; and 46 percent had no type of permit to enter the United States legally. If we apply these percentages to our estimate of the economically active population residing in Juárez in 1993, we obtain the results displayed in **Table 7**.

Alegría also reported that of the persons identified by the *ESAF* as cross-border commuter workers,

- 38 percent were U.S. citizens;
- 24 percent had visas that allowed them to work in the United States;
- 33 percent crossed the border legally with a BCC to work in the United States; and
- 5 percent were undocumented both for entry and work in the United States.

Because Alegría reports neither the raw frequency counts of these categories of commuters nor the standard errors of his estimates, we are unable directly to ascertain the confidence interval (plus/minus x percentage points) surrounding each estimate. We assume, however, that the confidence intervals are rather large, since the raw frequency

[13] The *ESAF* was optimistically named; rather than being conducted annually, it was conducted only once.

Table 7.

CATEGORIES AND ESTIMATED NUMBERS OF COMMUTERS

Category of Commuter	%	Est #
U.S. Citizen	38	5,752
Work Permit	24	3,633
Border Crossing Card Only	33	4,995
Undocumented	5	757
Total	100	15,137

Derived from: Alegría *(1990); Mexican Census of Population and Housing (1990).*

count for each category of commuter must be small, given the number of households in the sample and what we know from the *ENEU* about Juárez worker participation in the U.S. labor market.

To calculate the confidence intervals indirectly, assume that, on average, each household in the sample contained 5 persons, giving an n of 3,025 (the average household size for Juárez in the 1990 census). Assume further that 35.9 percent of these 3,025 persons, or 1,087, were economically active (the percent of the total 1990 Juárez population that was economically active). Finally, assume that 4.8 percent of these 1,087, or 52 persons, worked in the United States at least once during the week prior to the survey (the percent of the total economically active population working in the United States given by the *ENEU*, 4th quarter, 1989). Choosing a confidence level of 0.05, we can then say that:

- Between 25 and 51 percent of cross-border commuters were U.S. citizens;
- Between 12 and 36 percent held work permits;
- Between 20 and 46 percent had only the BCC; and
- 11 percent or less were undocumented.

Applying these intervals to our earlier estimate of a total of 15,137 cross-border commuter workers residing in Juárez at the time of the Operation, we obtain the estimates of numbers of different kinds of commuters displayed in **Table 8**. While these estimates are admittedly rough, based as they are on several assumptions, they nonetheless provide a number of insights for understanding the nature of cross-border work commuting by Juárez residents and the size of potential impacts of the Border Patrol's new deployment strategy upon different kinds of commuters.

Qualitative field work on both sides of the border in El Paso-Ciudad Juárez led to formulation of several related hypotheses regarding the overall effects of Operation Hold the Line on illegal border crossing and illegal employment of Juárez residents in El Paso.

Hypothesis One. Illegal crossings by Juárez residents have been reduced, but not eliminated.

Hypothesis Two. The number of illegal crossers residing in Juárez has been reduced less than the number of illegal crossings.

Corollary Two. Illegal crossers who live in Juárez and work in El Paso have extended their stays in El Paso to minimize their risk of apprehension while attempting illegal northbound crossings.

Hypothesis Three. Legal crossers who live in Juárez and work illegally in El Paso have continued to do so, but some have begun to cross less frequently in order to minimize the risk of losing their Border Crossing Cards.

Table 8.

ESTIMATED NUMBERS OF MEXICAN COMMUTER WORKERS RESIDING IN CIUDAD JUÁREZ

Commuter	% of Commuters		# of Commuters	
	Upper Limit	Lower Limit	Upper Limit	Lower Limit
U.S citizen	51	25	7,720	3,784
Work Permit	36	12	5,449	1,816
BCC Only	46	20	6,963	3,027
Undocumented	11	-	1,665	-

Derived from: Alegría *(1990); ESAF (1987); Mexican Census of Population and Housing (1990).*

Hypothesis Four. The Operation has initially discouraged both legal and illegal crossings from Juárez, but after the first few months legal crossers have begun to return to El Paso in numbers comparable to before the Operation began. Illegal crossings have also crept back towards earlier levels after the first month of the Operation.

This section examines these hypotheses by analyzing changes in the patterns of pedestrian border crossings on the Paso del Norte and Stanton Street International Bridges.[14] These two bridges carry the bulk of pedestrian border crossings in the El Paso area. Pedestrians may cross the border both northbound and southbound on the Paso del Norte Bridge, and southbound only on the Stanton Street Bridge. Every day, thousands of Juárez residents walk northbound on the Paso del Norte Bridge into downtown El Paso's "Golden Horseshoe," the commercial district in the city that most strongly caters to Mexican customers. This section is known as the Golden Horseshoe because of the path that the multitudes of Mexican shoppers tend to follow: north up Santa Fe or Oregon Streets, right on one of their several cross streets, and then south on Stanton Street to cross back into Juárez over the Stanton Street Bridge. Pedestrian crossers pay a toll of 50 cents to the Mexican government to cross north on the Paso del Norte Bridge, and 25 cents to the city of El Paso to cross south on either one of the bridges. It was on these bridges that disturbances occurred in the first days of Operation Blockade as Mexican commuters and several political organizations blocked traffic in protest of the INS confiscation of some commuters' BCCs.

Pedestrian crossing are recorded northbound by the U.S. Customs Service, and tallies are available by day, month, and year. Similar southbound figures are generated by the turnstiles counting toll-payers for the city of El Paso. Pedestrian crossing counts are the best measure of the legal movement of persons back and forth across the border; while counts of passenger vehicles are also available, no actual passenger counts are made either northbound or southbound. In principle, average monthly northbound and southbound pedestrian crossings should roughly equal one another, although in practice there are usually more northbound than southbound pedestrian crossings in any given month, a pattern that Operation Hold the Line does not seem to have changed much.[15]

What kinds of changes in pedestrian crossing patterns might result from Operation Hold the Line? Before the Operation began, it was common for undocumented crossers who lived in Juárez to cross the Rio Grande northbound illegally—by boat or wading, or by walking across one of the bridges in one of the southbound lanes—but then return to Mexico by walking across one of the bridges legally since they had nothing to fear by doing so.[16] One change, then, is that if Operation Hold the Line substantially reduced illegal crossings, the gap between northbound and southbound crossings would widen somewhat following the Operation's initiation. **Table 9** presents time-trend data on northbound versus southbound crossings by month, from

[14] The Paso del Norte Bridge is also known as the Santa Fe Bridge. The Stanton Street Bridge is also known as the Lerdo Bridge, after Avenida Lerdo that it connects with El Paso's Stanton Street.

[15] Many factors may account for the frequent "deficits" in southbound crossings. Commuter buses running between Juárez and El Paso (the "Red Bus" service that was halted indefinitely as of February 8, 1994) were obliged to discharge passengers on the Paso del Norte Bridge to walk through the U.S. Customs and Immigration checkpoint, and these commuters were thus counted as pedestrian crossers. Going southbound across the Stanton Street Bridge, these bus passengers were not counted as pedestrians, since they did not pass through the City of El Paso's pedestrian toll booth. Also, for some time before the Operation began, it was a common practice for package-laden shoppers to wait at the vehicle toll booths on the Stanton Street Bridge in hopes of hopping in the back of the next willing pickup in order to simultaneously avoid paying the 25 cent toll and carrying their loads across the border by hand. Some northbound pedestrian crossers may get rides back across the border in the vehicles of friends, relatives, and employers who live in El Paso. Mexican immigrants may enter the United States at the Paso del Norte port of entry and then stay permanently in the United States. Many other explanations are plausible; all are untested.

[16] Mexican authorities would obviously have no quarrel with their return. U.S. authorities would only be thankful that their job—to return illegal crossers to Mexican soil—was being done for them.

Table 9.

TRENDS IN NORTHBOUND AND SOUTHBOUND PEDESTRIAN CROSSINGS ON THE PASO DEL NORTE AND STANTON STREET INTERNATIONAL BRIDGES (BY MONTH)

April 1992 through March 1994. The north minus south difference went from 39,209 in August 1993, the last full month before the Operation began, to 115,219 in October 1993, the first full month after the blockade. In contrast, in the same months of 1992, the difference declined. Whereas in August 1992 there were 95,266 more northbound than southbound crossings, in October 1992 there were 37,496 fewer northbound than southbound crossings. This change in pattern tends to confirm a finding supported by several kinds of evidence: Operation Hold the Line is effective in stopping a substantial number of illegal northbound crossings in the immediate term.[17]

Table 10 summarizes changes in the monthly relationships between northbound and southbound pedestrian crossings that resulted from Operation Hold the Line. On average, before the blockade there were 8 percent more northbound than southbound crossings; in the months after the blockade there were, on average, 19 percent more. Calculated on an average daily basis, the difference between northbound and southbound crossings grew from 1,163 to 2,256, an increase of 1,093, due almost entirely to a reduction in southbound crossings. The postblockade averages presented in **Table 10** mask important differences between months, however, overstating the lasting impacts of the blockade. As **Table 9** indicates, the postblockade average difference is pulled up by the dramatic spike in the north-south difference and ratio in October 1993. By

[17]Wider fluctuations than this have occurred in the recent past, for example, the change between October and November 1992.

Table 10.

POSTBLOCKADE CHANGES IN DIFFERENCE AND RATIO BETWEEN NORTHBOUND AND SOUTHBOUND PEDESTRIAN CROSSINGS, PASO DEL NORTE AND STANTON STREET INTERNATIONAL BRIDGES

Measure	Preblockade Average*	Postblockade Average*	Change in Average
Ratio of northbound to southbound monthly crossings	1.08	1.19	+0.11
North minus south monthly difference	34,880	67,694	+32,814
North minus south daily difference	1,163	2,256	+1,093

*Excludes crossings during month of September 1993. Operation Blockade began on September 19 and resulted in disruptions in bridge traffic that make September data incomparable with other months.

Source: El Paso Department of Traffic and Transportation, US Customs Office, El Paso District

November, however, the difference and ratio between northbound and southbound crossings dropped to about August 1993 levels. From November 1993, through February 1994, northbound crossings were, on average, only 15 percent higher than southbound crossings, essentially the same level as July 1993, before the blockade. During the same four-month period the previous year, northbound crossings were, on average, 27 percent higher than southbound crossings.

These findings regarding the differences and ratios between north and southbound pedestrian crossings pre- and post-Operation tend to support two of our hypotheses above: hypothesis one, that illegal crossings by Juárez residents have been reduced, but not eliminated; and hypothesis two, that the deterrent effect of the Operation decreases over time. Immediately after the blockade, we see the expected reduction in southbound crossings relative to northbound, but this effect seems to diminish significantly over time. Such a result conforms to what illegal crossers told us about the Operation: in the first month following the blockade, crossing was difficult to impossible, but border crossing became easier in subsequent months.

Another effect of the Operation one might expect based on public reaction on both sides of the border, is a reduction in both northbound and southbound pedestrian crossings compared to the same months of the year prior to the Operation. Northbound crossings were down 4 percent and southbound crossings were down 10 percent after the blockade, as compared with the same period in the previous year. On the other hand, northbound crossings in the period April-August, 1993, before the blockade, were also down 4 percent compared with the same period in 1992. **Table 11** gives a clearer picture of how the blockade affected northbound crossings in both the short- and somewhat longer-term. October, 1993 northbound crossings were up 10 percent over 1992, but this may reflect the return of an unusually large number of shoppers and commuters deterred from crossing in the first days and weeks of the Operation in September to take care of affairs in El Paso that had been left unattended. Northbound crossings were down 33 percent and 21 percent in November and December, respectively, from the year before, lending considerable credence to the claims of downtown merchants in El Paso that traffic into their stores during the Christmas shopping season was down considerably. By January 1994, however, northbound pedestrian crossings were back up to their level of the previous year, and in February and March they surpassed the levels of the previous year. As **Table 11** also indicates, southbound crossings exhibit a similar pattern of sharp

decline soon after the Operation begins, after which they creep back up to comparable preblockade levels by January 1994.

These results tend to support hypothesis four, that the Operation initially discouraged legal border crossings, but that some of this effect diminished over time. It does appear, however, that declines in pedestrian border crossing were most pronounced during the Christmas shopping season, presumably hurting businesses in downtown El Paso that depend upon purchases made by Mexican cross-border shoppers.

According to reports in the *El Paso Times* and repeated to us by INS inspectors on the Paso del Norte Bridge, following the blockade in September 1993, there was a strong surge in legal pedestrian border crossings on the bridges, as well as an increase in the presentation of false or otherwise invalid border crossing documents. The reasons for this were thought to be that many persons who formerly

crossed the border illegally, were suddenly attempting to cross legally, either by using valid documents they had hitherto chosen not to use or by presenting fraudulent or invalid documents. While it is true that many more persons walked north into El Paso on the Paso del Norte Bridge in October 1993, than did in September 1993, the number in October was lower than it had been in August 1993, before the blockade began. In addition, northbound pedestrian crossings in October 1993, were up only 10 percent over the previous October, an increase far exceeded by the 36 percent jump seen between July 1992 and July 1993, also before the Operation. Thus, the apparent post-Operation surge in northbound crossings may derive from routine crossings that were interrupted in the early days of the Operation, creating a pent-up demand to cross once some semblance of normality returned on the bridges. As already noted above, northbound pedestrian crossings in November and December were sharply down from the year before, not supporting the notion that many persons who hitherto had crossed illegally began to cross legally after the Operation began.

In addition to changes in the difference and ratio between northbound and southbound crossings, and an immediate overall decline in pedestrian border crossing, we expected some changes in crossing by day of week following the Operation. There are several reasons for this. First, the Operation led to a decrease in pedestrian traffic into Juárez, particularly at night.[18] U.S. citizens feared harassment by Mexicans angered by the Operation and stayed away in the initial months. U.S. military forces stationed at Fort Bliss were prohibited by their commanders from going to Juárez from the time the Operation began until mid-February 1994. Thus, one would expect Friday (evening) southbound crossings and Saturday (early AM) crossings to be down somewhat, as well as Saturday (evening) and Sunday (early AM) crossings to be reduced.

Second, if closer scrutiny of the validity of crossing documents by INS officers on the Paso del Norte Bridge discouraged pedestrian visits to the United States (as seems to have been the case, at least initially), one would expect crossings to be disproportionately reduced on Saturdays, since Saturdays are heavy shopping days in downtown El Paso and shopping is a less necessary trip than going for employment or business.

Third, both legal and illegal crossers who work in El Paso report that their principal strategy for coping with increased surveillance at the border is to reduce the number of times they cross and increase the number of nights they spend in El Paso. Those working illegally, but crossing with their BCC, reduce crossings to reduce the chances of having their crossing documents confiscated. Those crossing illegally do so less frequently to minimize their risk of being detained by the Border Patrol, a risk that greatly increased since the Operation began. One would thus expect to see increased southbound pedestrian bridge crossings on Saturdays, as persons who have stayed over to work in El Paso during the week return to Juárez. Similarly, one might also expect some increase in northbound bridge crossings on Sundays, as persons working in El Paso attempt to cross the bridge at an hour when they are less likely to be suspected of going to work than, say, if they were crossing early Monday morning.

The next two tables summarize the results of a kind of "shift-share" analysis conducted of pedestrian bridge crossing patterns. We compared southbound crossings on different days of the week, postblockade, by month in 1993-1994 with crossings during the same period in 1992-1993. The same was also done for northbound crossings. The ratios that appear in **Tables 12** and **13** were calculated as follows. Total crossings in a given month were apportioned to different days of the week as if they were evenly distributed by day, so that as many crossings occur on a Friday, say, as do on a Sunday. The number of crossings generated for a given day of the week is the expected number of crossings for that day in that month. We then divided the actual number of crossings that occurred by the expected number to produce the ratios in the tables. If crossings were evenly distributed by day, the value of each ratio would be 1.00. We interpret the ratio obtained for

[18] CONACO, the official Mexican Chamber of Commerce, has produced a report decrying the negative impact that the Operation has had on restaurants, bars, and nightclubs in Juárez (See Chapter IV for more detail).

southbound pedestrian crossings on Fridays in October 1992 as meaning that "17 percent more southbound crossings were made on Fridays than one would expect simply on the basis of the number of Fridays in the month." Of interest in our analysis are the changes in these ratios for the same month of the year prior to the Operation and during the Operation. **Table 12** indicates, for example, that Fridays in October 1993, lost a slight share of total southbound crossings for the month as compared to 1992. Instead of there being 17 percent more Friday southbound crossings than expected, there were only 15 percent, a decline in share of two percentage points.

What changes in patterns of crossing by day of week were observed following the Operation? In the first two months, southbound (October and November of 1993 versus the same two months of 1992) , and in the first three months northbound (October through December), Saturday pedestrian crossings decline sharply relative to other days of the week (See **Table 12** for southbound and **Table 13** for northbound figures). Saturday's share of southbound crossings was down 42 percentage points in November from the year before, and northbound its share declined by 73 percentage points. Meanwhile, the share of pedestrian crossings in both directions

captured by the Monday-Thursday weekday period[19] rose in the first two months following the Operation, when compared with the previous year. This decline in both directions on a prime downtown shopping day and increase in both directions on days in the work week are consistent with the hypothesis that, immediately following the Operation, unnecessary pedestrian crossings (to shop, pay social visits, etc.) were discouraged relative to more necessary crossings (to work, for example). This finding accords with the other finding above that overall pedestrian bridge crossings declined substantially during the peak Christmas shopping season after the blockade.

After the first two months of the Operation, Saturday's share of southbound pedestrian crossings rose relative to the previous year (**Table 12**). This change in pattern suggests that over time, both legal and illegal crossers who worked illegally in El Paso responded to the Operation by reducing their number of crossings and extending their number of nights spent in El Paso during the work week, thus supporting corollary two of hypothesis two and hypothesis three above. It also tends to support hypothesis two itself, that the number of illegal cross-

[19] Fridays are unlike other weekdays for several reasons. Some persons working during the week in El Paso may return to Juárez on that day. Youth, military personnel, and other groups also tend to cross the border southbound on Friday to go out for the evening. Large numbers of other persons may walk back and forth across the bridges on Friday as they would on any other work day. Friday is therefore an ambiguous case, similar to Monday-Thursday in some ways, and to Saturday in others. Postblockade changes in Friday's share of crossings in both directions, not surprisingly, show no clear pattern.

ings has been reduced more than the number of illegal crossers. Additional support for hypothesis three can be found in that, after the first two months of the Operation, Sunday's share of northbound crossings increases strongly relative to the previous year, suggesting that legal crossers who work illegally in El Paso may be crossing north in greater numbers on Sundays to have the purpose of their visit less subject to scrutiny and challenge by INS inspectors at the port of entry.

A final cautionary note: a shift-share analysis serves primarily to improve observation of changes in a patterned social phenomenon; it does not indicate the causes of the changes observed. Thus, the interpretations offered here are tentative. Their likely validity, however, is enhanced by the fact that they accord with other pieces of qualitative and quantitative evidence. Also, the changes observed were not dramatically large, which should come as no surprise, however, since our best estimates indicate that the number of Juárez residents working illegally in El Paso is small relative to the combined working populations of the two cities. A change in the behavior of less than two thousand illegal crossers/illegal workers and less than seven thousand legal crossers/illegal workers, not all of whom will respond similarly to the Operation and not all of whom use the Paso del Norte and Stanton Street pedestrian bridges to return to Mexico, is unlikely to produce radical changes in pedestrian crossings that number in the hundreds of thousands per month. By the same token, the changes observed, while perhaps not dramatic, are not subject to statistical probability error, since they are counts of all legal pedestrian crossings on these bridges. They are not estimates based on a sample of crossers. Consequently, we have no doubt that crossing patterns have indeed changed in the ways observed here.[20] When combined with qualitative reports obtained from government officials and residents on both sides of the border, these data provide a more complete picture of the effects of Operation Hold the Line on people's behavior related to the international boundary dividing El Paso and Juárez.

[20] Unless, of course, the counts supplied to us by either the Customs Service or the City of El Paso were themselves erroneous.

Conclusions

Several major conclusions about the effects of the Operation on illegal flows and legal/illegal border crossings are suggested by the findings that emerge from the analyses of INS apprehensions and bridge crossings data presented in this chapter. First, the Operation seems to have sharply reduced illegal flows into El Paso. Second, this decline appears to be diminishing the longer the Operation lasts. Third, a substantial amount of long-distance labor immigration appears to have been diverted to other ports-of-entry on the U.S./Mexico border. Fourth, legal crossers/illegal workers and illegal crossers/illegal workers appear to have extended the duration of their stays in El Paso and changed the daily pattern of their crossings to minimize the risk of detection/document confiscation. The Border Patrol in El Paso has said that, prior to the Operation, about 60 percent of persons apprehended were Juárez residents whose destination was El Paso and 40 percent were persons headed for other U.S. destinations. The results presented in this chapter suggest that the Operation's greatest effect has been to deter or make more difficult illegal crossings by short-term migrants residing in Juárez. Also, the late post-Operation increases in apprehensions outside the El Paso sector are about 45 percent of the decline in apprehensions in the El Paso sector, which suggests that long-distant labor migration has moved elsewhere. We return to these conclusions below after analyses of other data and examination of other situations thought to have been influenced by the Operation. These additional analyses help determine the degree to which these initial conclusions can be embraced with greater confidence or must be viewed as hypotheses contradicted by other evidence.

IV. Effects on Business and Economic Activities

Within days of its implementation, many members of the El Paso business community stated their opposition to Operation Hold the Line. Hostility to

the Operation rose as it appeared that sales were being lost to a combination of the interruption of traffic into the city from Juárez and the "Buy Mexican" campaign proposed by the governor of the State of Chihuahua, and such Mexican business organizations as *Cámera Nacional de la Industria de la Transformación* [*CANACINTRA*] and *Cámera Nacional del Comercio* [*CANACO*]. Business leaders declared in open meetings, at city hall and in the media that the Operation was having a significantly negative impact on the economic activity of the city by preventing or discouraging Mexican patrons from crossing the border to shop. As it has been estimated that as much as 40 percent of all purchases in the retail sales industry in the city are made by consumers from Mexico (Institute for Manufacturing and Materials Management 1991), anything that interfered with consumer access to El Paso stores could reasonably have a major impact on the city's economic stability. In order to assess the real impact of the Operation on local business activity, the research team interviewed leaders of the El Paso and Juárez business communities, analyzed data from the Texas State Comptroller's Office on sales tax receipts and sales by zip code area, and examined data on the local labor market, hotel occupancy, bus ridership, and auto accidents in El Paso.

Business Leader Response

The top officials of the Greater El Paso Chamber of Commerce [GEPCC], the El Paso Hispanic Chamber of Commerce [EPHCC], and the El Paso Downtown Development Association [DDA] were interviewed separately regarding the effects of the Operation both on their members specifically and on the El Paso business environment in general. The leaders of the three organizations expressed similar positions regarding the Border Patrol's new strategy for policing the border. None of the leaders expressed any objection in principle to the redeployment of Border Patrol agents to the frontline border. Rather, they complained about the implementation of the Operation by the federal authorities, which they believed was done without regard for its effects on the local community.

First, they objected that the Operation was launched without warning. They felt that they should have been consulted prior to the redeployment of agents so that they could have minimized any negative impacts on business in El Paso and avoided alienating Mexican customers of El Paso businesses. Having spent many years developing close working relationships with the Juárez and Chihuahua City business communities, they were hard pressed to convince their counterparts across the Rio Grande that they did not receive advance notice of the Operation. Representatives of the GEPCC, EPHCC, and DDA requested meetings with officials from the INS/Border Patrol and Customs Service subsequent to the Operation to promote better communications and understanding between the federal authorities and the local communities. These meetings continue to take place, but leaders of each organization expressed doubts as to whether the meetings would lead to greater INS/Border Patrol sensitivity to their concerns in the future.

Second, they objected to the conceptualization and naming of the INS operation as a "blockade," and its implementation as a "crackdown" attempting to "seal" the border. Leaders of each of the business organizations maintained that "perception is reality," especially when most people get their information from the news media and not from direct experience with events. They complained that the overnight presence of dozens of armed Border Patrol agents at the river and on the international bridges gave the appearance of a military blockade of the border. This image, once transmitted by the news media to people in Mexico, provoked widespread fear and resentment, even on the part of many people who had legal authorization to cross the border. A blockade, these leaders argued, is what the United States did to Cuba and Iraq and implies both a ban on movement of persons and a prohibition against trade and commerce. A blockade on Mexico, a friendly and close neighbor and ally of the United States, could be taken as an affront to Mexicans. This came at a particularly sensitive time, just six weeks before the Congressional vote on NAFTA and in the middle of the El Paso business community's promotion of the El Camino Real Corridor, an economic alliance among Mexican and American cities

stretching from Chihuahua City to Santa Fe, New Mexico. The president of the GEPCC complained that having pictures of "armed guards and steel walls" associated with El Paso in the national media has made it harder to convince companies to locate in El Paso. All three organizations expressed reservations about the construction of any new walls along the border and the use of such military forces as the National Guard to aid the Border Patrol in Operation Hold the Line.

Third, leaders of all three organizations expressed concerns about the treatment of Mexican holders of border crossing cards by INS personnel on the international bridges both during the initial stages of the Operation and subsequent to its conversion to Operation Hold the Line. They received reports from their members that Mexican customers had been subjected to "undue and aggressive" interrogation by INS agents on the bridge, had been turned back at the gate when they were deemed to have insufficient funds to shop, and had their valid border crossing cards confiscated when they failed to answer questions to INS inspectors' satisfaction. The president of the GEPCC and the chairman of the board of the EPHCC each recounted the experiences of Mexican business people they knew, one of whom had owned a business in El Paso for many years, who had been turned back at one of the international bridges after presenting documents they had used for years to cross legally. Making it more difficult to enter the United States for Mexican nationals who have a legal right to do so inevitably hurts business in El Paso, these leaders argued. In each interview, the same observation was made: the federal government had managed to produce additional funds to mount the blockade, but had made no funds available to facilitate legal border crossings by Mexicans. One way this could be done, the business leaders felt, would be to streamline what they see as the current lengthy and expensive bureaucratic process for obtaining Border Crossing Cards.

In terms of the effects of the Operation on the businesses of their members, the leaders of all three organizations reported that they had heard no complaints from members that they had lost any Mexican employees who regularly commuted from Juárez or that any of these employees had been prevented from getting to work in a timely fashion. With regard to the impact of the Operation on sales, there was consensus that the businesses most affected were those retail stores in what is known as the "Golden Horseshoe" in downtown El Paso (South of I-10), which serve many Mexican pedestrian bridge-crossers, and that businesses that could only be reached by car or bus from the border (i.e., those not within walking distance from the river) were less affected. The leader of the DDA reported that although Christmas season sales in 1993 appeared to have been better for the El Paso downtown merchants than they were in 1992, they might have been better still were it not for a "buy Mexican" campaign launched by Juárez retailers to exploit nationalist resentment against the blockade on the part of Mexican consumers. In any event, the DDA leader maintained, the bounce-back in sales in November and December of 1993 did not make up for the losses incurred downtown in September and October, a claim that corresponds fairly well to observations based on zip-code retail sales and to pedestrian bridge-crossing data.

Sales

Gross retail sales are reported to the State Comptroller's Office quarterly. The Research Division provided quarterly reported gross sales data for the retail trade industry for each zip code (**Figure 2**) in El Paso through the end of the fourth quarter of calendar year 1993. **Table 14** shows the percent change in reported gross sales for each zip code area in 1993, comparing each quarter with the same quarter in 1992. El Paso experienced a 5.5 percent increase in reported gross sales in the retail trade industry for the year. The fourth quarter experienced a 3.8 percent increase, the lowest change of any quarter. Only six of the eighteen zip code areas in El Paso showed a decline in the fourth quarter (the quarter in which the Operation occurred), although eight showed an overall annual decline. The overall increases for both quarter and year are heavily influenced by the increases for the quarter and year that occurred in one zip code (79925). That area, containing the international airport and a large shopping mall, accounted for 29.4 percent of the annual gross reported sales in the

Figure 2.

El Paso Postal Zip Codes

retail trade in El Paso and 31.7 percent during the fourth quarter.

Initial complaints about loss of business due to Operation Hold the Line came from business people in the downtown districts. The available data appear to support their contention. Of the six zip code areas that showed a decline in the fourth quarter of 1993 versus the fourth quarter of 1992, four are close to the city's center. Zip code 79901 comprises the downtown district of El Paso south of Interstate 10 and includes the area at the foot of the Paso del Norte Bridge. The area includes the city's civic center and contains the shopping district that serves those Juarenses who walk across the bridge. This area accounted for 10.4 percent of total reported gross retail sales in the city during 1993. Reported gross sales declined by 3.6 percent in that area during the fourth quarter of 1993 versus the fourth quarter of 1992. Other downtown areas include zip code area 79902 (north of Interstate 10), zip code area 79903 (north of Interstate 10 and east of zip code area 79902), and zip code area 79905 (which includes the district at the foot of the Bridge of the Americas). For those four zip code areas combined, fourth quarter gross reported sales in the retail trade industry declined by a total of 8.2 percent. Because of their central location and proximity to the border, complaints that the Border Patrol's operation hurt business in the area appear justified. However, each of those four areas also reported declines in gross sales in 1993 from the comparable period in 1992. Of the twenty-two reported periods of declining sales during 1993, ten were reported by those four zip code areas. Other zip code areas (79907, 79915, and 79922) also are bordered on the south by the Rio Grande but are not downtown. All showed increases in the fourth quarter of 1993 versus the fourth quarter 1992.

City Sales and Use Tax Collections

Analyzing collections of city sales taxes is another useful way of evaluating the effects of Operation Hold the Line on El Paso's economy. In Texas, the State Treasurer collects sales tax revenues for all taxing entities in the state—state, city, county, and metropolitan transit authorities. Business people forward tax receipts from customers depending on a formula that includes the taxpayer's average monthly revenue. Quarterly sales tax payments are due in the months of February, May, August, and November. The State Treasurer remits to each taxing entity its portion of the tax receipts in a monthly allocation. This amount, remitted by the State Treasurer to each city, roughly represents the amount of city sales tax collected during a given time frame. Taxpayers do not always forward their tax receipts on time and the resulting penalties and interest payments are also included in the monthly allocation figures. While these may alter the data somewhat, they should have little effect on the overall assessment of economic activity.

City sales tax remittances allocated to each city each month are directly related to taxes, penalties, and interest payments received by the State Treasurer. Thus, allocations for February, May, August, and November are generally significantly higher than for the remaining months. They do not indicate periodic surges in economic activity, and adjustments must be made for their presence. **Table 15** shows the percent change in sales tax allocations for selected cities in Texas for the past three years. The last row shows the percent change in sales tax allocations to all the cities in the state. From 1992 to 1993, sales taxes allocated to El Paso increased by 8.4 percent as compared to an 11.1 percent increase for all cities in the state. However, allocations to El Paso have been below the state average in five of the past six years.

Table 16 compares the percent change in sales tax allocations for selected cities in Texas for October through April during the past three years. During the period since Operation Hold the Line began, i.e., October 1993 through April 1994, sales taxes allocated to El Paso increased by 8.7 percent over the same period in the previous year. This compares to a 12.3 percent increase in sales tax allocations for all cities in Texas during the same observation period. Over the past four such observation periods, El Paso's allocations have lagged behind the state, on average, three out of four times. Thus, while the Operation appears to have exerted a negative effect on downtown business activity, it does not appear to have influenced overall business sales negatively in the larger metropolitan area.

Labor Market

Many people suggest that undocumented migrants entering El Paso to obtain work take jobs away from El Paso residents. If this is true, and if the Operation has been successful in stopping undocumented migrants from entering El Paso, one would expect to see an increase in the number of new job postings after the implementation of Operation Hold the Line. This would particularly be true in the kinds of jobs thought to be filled by illegal migrants: primarily positions in the services, machine trades, benchwork, and structural work occupation groups.

One measure of economic activity in the community is the number of new job order postings recorded each week through the Texas Employment Commission [TEC]. Part of the TEC mission is to assist unemployed persons in their job searches. Many organizations, in both the private and public sectors, notify the local Texas Employment Commission office when jobs become available. Employers seeking persons to fill specific job openings submit job orders to TEC, which, in turn, matches legal U.S. residents who are seeking employment to those job openings. A significant rise in job orders placed by employers with the Employee Services unit of the TEC's office in El Paso is another way in which an increased demand for legal employees in El Paso could be reflected.

To assess the effect of the Operation, the Texas Employment Commission's El Paso Office collected data on new job postings for fifty-nine weeks from January 7, 1993, through May 18, 1994. **Table 17** presents the number of job orders received from employers during the reporting weeks for jobs in the services, machine trades, benchwork, and structural work occupation groups. It also shows total job orders for all nine occupation groups. These data do not cover every week during the period nor do they cover a sufficient period to allow for time-series analysis, but they do provide a rough estimate. As can be seen, the TEC received no obvious surge in placement of job orders following implementation of the Operation, as might have been expected had large numbers of illegal workers suddenly been removed from the El Paso work force. For the week of September 23, 1993, the first week of the Operation, new job order postings increased 1 to 5 percent in the four occupation groups shown; however, new postings dropped in all four groups the following week.

Table 18 shows the mean number of new job order postings for the four occupation groups and the total prior to and after the implementation of Operation Hold the Line, as well as the means for the entire data set. As can readily be seen, the mean number of new job order postings after implementation of the Operation declined in three of the four occupation groups after the Operation was implemented. Only in the machine trade occupation group did the mean number of new job order postings rise, and then only by 1.3 percent. The incompleteness of the available data limits analysis; however, it would appear that the operation has had little, if any, impact on the formal labor market in El Paso. It is more likely that the fluctuations observed in the data are due to changes in economic conditions or effects of the business cycle. It may be that many Juárez residents who work illegally in El Paso do so not for formal companies, but rather for private individuals and informal enterprises in various kinds of domestic service—lawn maintenance, gardening, housecleaning, daycare, and construction. Employers of illegal workers, to the extent that they are not formal companies, may not tend to use the TEC job order service.

If the number of Juárez residents working illegally in El Paso were very large, if such persons were performing jobs vital to the local economy that were seen as desirable by legal U.S. residents, and if Operation Hold the Line made it impossible for a substantial number of those working illegally before the Operation to continue to do so afterwards, one would expect the demand for labor from U.S. residents to rise measurably after the Operation began. One way in which increased demand for U.S. resident labor could manifest itself would be in a decline in the local unemployment rate in the months following the blockade. **Table 19** gives monthly unemployment figures for El Paso County from 1989 through the end of 1993. As can be seen, no substantial, unseasonable rise or fall in the unemployment rate took place after the Operation started in late September 1993. The post-Operation average unemployment rate of 10.6 percent is identical with both the average rate for the months January-August from 1989 through 1993 and for the months October-December from 1989 through 1992.[21]

Our field work and review of the relevant quantitative data available in El Paso/Juárez indicate that the proportion of Juárez residents working illegally in El Paso before the blockade was probably relatively small and that most of them worked in domestic service, as street vendors, or for construction contractors at rates of pay not attractive to most legal U.S. residents. As noted above, while the Operation has reduced illegal crossings, it has not entirely eliminated them. Moreover, part of the reduction in illegal crossings may be due to people extending their stays on the El Paso side so as to continue working while commuting back and forth less frequently. Finally, most of the Juárez residents working illegally in El Paso cross the border legally with a Border Crossing Card and thus have not been

[21] We exclude the month of September from these comparisons of the average unemployment rate because of the temporary disruptions that occurred in cross border traffic in the first days of Operation Blockade.

prevented from working by the Operation, which seeks mainly to curb illegal crossings, not illegal employment. Thus, the lack of any sign of a substantial impact of the Operation on the El Paso labor market is perhaps not surprising.

The legalization provisions of the Immigration Reform and Control Act of 1986 are also likely to have had an impact on the employment and wages of undocumented Mexican workers in the El Paso area (Sorensen & Bean 1994). In the late 1980s, many Mexicans living and working illegally in El Paso legalized their status through the INS amnesty program. Thus hundreds of maids, gardeners, farm workers, nannies, mechanics, and others who formerly worked illegally continued on in their jobs as legal workers. According to the leader of the *Union de Trabajadores Agricolas*, an El Paso farm worker organization, most farm workers in the area now are legal residents. According to this source, most growers and ranchers have no incentive and thus refuse to hire undocumented workers. In El Paso's Plaza San Jacinto, interviews at bus stops with a number of immigrant women working as housecleaners uncovered that they were not Juárez commuter workers, but legalized El Paso residents. It is likely, then, that the legalization of many of the El Paso area's undocumented workers may have dampened any labor market effects that Operation Hold the Line otherwise might have had.

Tourism

Although there was some initial concern over the potential impact of the Operation on tourism in El Paso, that concern appears to have rapidly waned. Tourism is the second largest industry in El Paso, and one would have expected a decline in hotel occupancy rates if tourism were appreciably affected. **Table 20** shows monthly hotel occupancy rates from January 1990 through May 1994. The rates dropped from September 1993 through February 1994 compared to the same months in the previous year. However, occupancy rates have been declining over the past three years. The major exceptions, in July and August 1993, were due to state and regional meetings held in El Paso during those months.

Conversations with El Paso Tourist Bureau employees suggest that factors other than Operation Hold the Line were at work and, in their judgment, were more likely to have influenced tourism and hotel occupancy than the Operation. A major factor appears to be the declining budget of El Paso Tourist Bureau. Advertising is a prime factor in inducing people to visit the city. Another factor may have been the nationwide trend in recent years for shorter vacations, which means that tourists tend to stay closer to their home areas. El Paso draws on the northern plains states and the Midwest for much of its tourism trade. Because of its distance from those areas, El Paso may be experiencing the effects of the general trend and the unwillingness of tourists to spend extra time on the road.

Bus Ridership

We also received ridership data from representatives of both Sunland Metro (the local bus company) and Greyhound Corporation in El Paso. Neither

company noted any appreciable change in ridership following the launching of Operation Hold the Line. Greyhound notes that it makes little sense for undocumented Mexicans to attempt to leave El Paso on its buses because Border Patrol personnel routinely board buses at highway checkpoints on the way out of town to check riders' documents. About one or two undocumented persons a month are removed from Greyhound buses as a result.

That Sunland Metro ridership was not affected by eliminating the crossing of undocumented Mexicans seems to indicate that few undocumented residents of Juárez were using the Sunland Metro system to get to work in El Paso. Conversely, it also suggests that the majority of the Mexican domestic workers employed in El Paso are (1) either U.S. citizens or legal permanent residents who choose to reside in Juárez while working in El Paso, or (2) holders of Border Crossing Cards who enter the United States legally in order to work illegally. At the downtown San Jacinto Plaza we ascertained that many Mexican women queued up every morning to board Sunland Metro buses headed for outlying parts of El Paso. Thus, the Operation does not appear to have halted the employment of domestic workers from Juárez.

Accidents

One alleged side effect of Operation Hold the Line was improved safety along Loop 375, the "Border Highway" that extends from the Paso del Norte Bridge in downtown El Paso to the Zaragoza Bridge. This stretch of highway parallels the Rio Grande and is an obstacle to illegal border crossers. Having crossed the river, migrants are faced with crossing this high-speed, limited-access, four-lane divided highway, a main traffic artery bringing El Pasoans from the east into the downtown area. Prior to the Operation, migrants were known to run across the road, dodging oncoming traffic. Border Patrol agents were stationed along the levee between the river and the highway as part of the Operation Hold the Line strategy. This placement of agents virtually eliminated border crossings in that area. Several interviewees cited the reduction in highway congestion caused by border crossers and the consequent reduction in highway accidents and fatalities.

A Texas Department of Public Safety search of its official record of automobile-pedestrian traffic accidents January 1, 1989 through May 1993, along the border highway from Santa Fe Street at the foot of the Paso del Norte Bridge and Zaragoza Avenue, which extends from the Zaragoza Bridge, found thirty-four reports involving thirty-six pedestrian injuries.

Table 21 provides information about each of those reported accidents. Two involved El Paso residents, one with a non-Hispanic surname. Twenty-one of the pedestrians were residents of Juárez, eight were from the interior of Mexico, and the residences of five were undetermined. Ten of the accidents resulted in fatalities. In one accident, two pedestrians were killed. In anther accident a mother carrying her one month old baby was injured and the child was killed.

While there have been no automobile-pedestrian accidents reported on Loop 375 since May 1993, there is insufficient data to determine what effect, if any, Operation Hold the Line has had. In spite of the suggestion that automobile-pedestrian accidents were frequent occurrences, there have been no more than 8 in any one year, and the average is fewer than 6.5 per year.

Juárez Business Activities

We interviewed several leaders of the three major business organizations in Juárez: the *Cámera Nacional de Comercio* [*CONACO*], the *Cámera Nacional de la Industria de la Transformación* [*CANACINTRA*], and *Desarrollo Económica de* Juárez. Of the three, only *Desarrollo Económica* is not officially sponsored by the national government. We asked for their views on Operation Hold the Line in general and its effects on the economy of Juárez in particular. There was general consensus in both their views on the Operation and its effects on the Juárez economy.

First, all three viewed the Operation as an unnecessary affront to Mexicans and the antithesis of the good neighbor policy that they and their counterparts in El Paso had been trying to develop over the years with such joint projects such as the creation of the *El Camino Real* trade corridor. Manuel Ochoa, the leader of *CONACO*, placed particular emphasis on the interdependence of the two cities, commenting that "the two are not just twin cities, but Siamese twin cities, sharing the same digestive system." The other leaders concurred that what was damaging to Juárez was also damaging to El Paso and that federal authorities in Mexico City and Washington often failed to appreciate this local reality. Each business leader expressed resentment of the portrayal in the press of Mexican illegal crossers as a criminal element and of the INS officials' treatment of legal Mexican crossers as criminal suspects. Each knew of business people or their employees who had experienced harassment and other difficulties at the hands of INS officials on the bridges in the first days after the Operation began, though they acknowledged that treatment of Mexican entrants subsequently improved. They emphasized that Mexicans who crossed into El Paso illegally were "productive people who go there to work, not to steal," in the words of Mr. Ochoa. While the leaders did not question the Border Patrol's right to enforce the laws of the United States, they did object to the way in which the Operation was undertaken: as a surprise, action that fomented animosity between Mexicans and U.S. citizens.

Second, all three business leaders concurred that the negative publicity surrounding Operation Hold the Line led to steep drops in business among restaurants, bars, nightclubs, and shops in downtown Juárez that catered to U.S. tourists. A press release issued by CONACO shortly after the Operation's implementation described its impact:

> On September 19, 1993, the Immigration and Naturalization Service of the United States of America, acting through the Border Patrol, El Paso District, under the command of Silvestre Reyes, implemented what was named "Operation Blockade," with the goal of reducing the flow of undocumented persons across the international boundary separating Juárez and El Paso. Parallel to this, a negative publicity campaign towards Ciudad Juárez was undertaken by the U.S. press which warned U.S. citizens of the risks they faced upon visiting this border city and exposing themselves to a situation of lack of public order and police abuse. The effects of this were felt immediately in the form of a drop in visitors from El Paso, who were even less disposed to come upon seeing the long lines going back into El Paso occasioned by the scrupulous inspections being realized by immigration and customs agents.

[22]Woman was carrying the baby. Two witnesses with the woman accompanied her to the hospital. The woman, baby, and witnesses were all illegal aliens.

[23]Blood-Alcohol Content was 0.23.

CONACO's Department of Economic Studies conducted a survey of thirty restaurants, eight discotheques, eighteen bars, and twenty-two hotels located on streets in the city's tourist area, and asked each to estimate how much their business was up or down in number of customers entering their establishments since the Operation and reported:

- Discotheques experienced a 38 percent reduction in clientele, on average;
- Bars experienced a 74 percent reduction; and
- Restaurants and hotels each experienced a 45 percent reduction in customers immediately following the blockade.

At the same time, *CONACO* acknowledged the limitations of its survey:

> We are conscious of the fact that it is difficult to make a precise quantitative evaluation of the repercussions of the Operation. Furthermore, several other situations come into play such as: old problems of public security, traffic, taxi drivers, street vendors and beggars, and police, as well as the gradual loss of the tourist sector's ability to attract visitors contraction of economic activity in the country as a whole, as a consequence of measures taken by the Mexican government in 1992 to decelerate the economy and reduce inflation to one digit; and the economic difficulties faced by the United States and that impact us directly.

In other words, the Juárez tourist business was already hurting before the Operation began, and the other problems plaguing it make it difficult to gauge the Operation's effects after its first few weeks. None of the three business leaders we interviewed felt that other sectors of the Juárez economy had been materially harmed, and none, save for those appearing in the *CONACO* report quoted above, had received complaints from their members reporting specific business problems generated for them by the Operation.

Conclusions

The implementation of Operation Hold the Line may have affected the economic activity in central areas of the city negatively; however, its impact apparently was not felt much in other parts of the city. Comparing the reported gross sales in the retail trade industry in El Paso during the fourth quarter 1992 to the fourth quarter 1993, the city showed a 3.8 percent increase overall. As this is the lowest percent increase of any quarter during the year, it is not unreasonable to believe that Operation Hold the Line had some negative influence. The decline in the downtown area was almost certainly due in part to a combination of factors related to the Operation, including a reduced flow of undocumented border crossers, delays of documented border crossers at the ports of entry (because of either more stringent inspections or protests on the Mexican side), anti-American sentiment and the "Buy Mexican" campaign, and general concern by Mexican residents about crossing into El Paso to shop. However, other factors, including the condition of the Mexican economy, may have played a role. It is difficult, therefore, to determine to what extent Operation Hold the Line affected retail sales in El Paso during its first three months of operation.

Comparison of city sales and use tax data do not suggest that Operation Hold the Line had any significant impact on the overall economy of the city. El Paso has about 3.5 percent of the state's population. Receipts from city sales and use taxes in El Paso constitute about 2.5 percent of the state's total revenue from those sources, reflecting the area's economic conditions. Over the past six years these percentages were relatively constant. El Paso's trailing behind the state's average growth is more likely due to national and global factors than to Operation Hold the Line. Comparisons of labor market data, hotel occupancy rates, and bus ridership information also provide little evidence to indicate that the Operation had much overall effect, although downtown businesses may have been affected. Business leaders' complaints, except in the case of downtown businesses, thus appear to have been exaggerated and largely unfounded.

V. Effects on education, Births and Social Services

This chapter examines the effects of Operation Hold the Line on school enrollments, registered births in El Paso County, births in Thomason Hospital (the only hospital in El Paso County providing indigent health care), and welfare programs in El Paso. Examination of these factors is important because of the widespread perception that illegal migrants are attracted to U.S. border communities because they can receive free social and health services there. If these types of flows were large to begin with, and if the Operation has slowed the flow of these persons crossing the border, we should see some evidence of this in the form of fewer persons receiving social and health services after than before the Operation. This chapter also reports what was learned about the effects of the Operation on the delivery of social services in Juárez, although the information we were able to obtain was quite limited.

Education

There has been considerable discussion about the impact of illegal immigration upon the United States' educational system. Studies of the costs of educating the children of illegal immigrants find that this expense is one of the highest, if not the highest, associated with illegal immigration (Clark & Passel 1993; Huddle 1993). For some observers, this expenditure is viewed as a sound investment in the nation's future. However, for others such children are seen as "free riders" because their parents often do not shoulder a proportionate share of state and local taxes used to finance education, even though they pay a substantial amount of federal taxes. In communities along the U.S.-Mexico border, an important issue is the extent to which Mexican children cross the border to attend schools free, especially middle and high schools, as free public education in Mexico extends only through sixth grade. Thus, it has been argued that if the Border Patrol were able successfully to stem the flow of illegal migrants into the United States and of children crossing the border from Mexico to attend school, the burden on local taxpayers would be greatly diminished. An important part of assessing the impact of the Operation thus involves determining how the Operation affected the El Paso schools.

At the outset, the distinction between Mexican residents and illegal immigrants must be clarified. These two groups are often lumped together during the debate over school financing, as well as debates over such issues as medical care, but they are two very distinct groups, each of which has a different impact on U.S. immigration and immigrant policy. One group consists of Mexican residents who send their children to El Paso for free public schooling, thus violating laws dealing with both public education and immigration policy. The other group consists of immigrants who enter the country illegally and settle. This group is violating immigration, but not education, laws. While we are not condoning the violation of any law, for the present discussion it is important to understand the differing nature of the violations committed by each group.

El Paso is a multicultural city with a large Hispanic population. Approximately 70 percent of the city-county population is Hispanic. There are nine independent school districts [ISDs] in El Paso County, two of which are in the city itself. In the Fall 1993-1994 school term, 64,141 students were enrolled in the El Paso ISD, and 49,398 were in Ysleta ISD. Hispanics constituted 74.3 percent of the enrollment in El Paso ISD and 83.2 percent in Ysleta ISD. The remaining seven ISDs enrolled 33,758 students, of whom 90.2 percent were Hispanic.

While the public argument rages over the free rider issue, a combination of legal restrictions and funding limitations have prevented school districts from eliminating illegal immigrant and border crossing students from their enrollment rosters. The free-rider perception notwithstanding, the U.S. Supreme Court [*Plyler v. Doe*, 457 U.S. 202, 102 S.Ct. 2382 (1982)] declared that the age and residence of the student or the residency of the student's parent(s) are the sole criteria for admission to public schools. Further, under federal guidelines, residency requirements have been declared inapplicable when a child is declared homeless. Therefore, school administra-

tors are prohibited from asking applicants their nationality or immigrant status. To conform with that ruling, the 72nd Texas Legislature amended Section 21.031 of the Texas Education Code relating to the admission of children to the public school system so that under current law, the only requirement to attend a public school in Texas is residency within that school's district. Consequently, the distinction discussed above between Mexican residents and illegal immigrants plays a key role in education policy because it is not a more serious violation of state and federal law for a student who resides in Mexico to fraudulently enroll in an El Paso area school than it is for a student who is a resident of another school district within the county.

Since residency is the key requirement for school enrollment, the issue for school district administrators has become one of determining the actual residency of the prospective student. To prove residency, an applicant must submit some form of documentation that reasonably assures the school district's administrators that the student does reside within the district. Acceptable documentation includes utility bills, rent receipts, and notarized statements by landlords confirming a person's residency. The various forms of acceptable documentation are evidently easy to obtain. Anecdotal evidence suggests that documents can be obtained through the black market if not from friends or relatives, so the task of confirming a student's residency declaration with absolute certainty is nearly impossible. As in most jurisdictions around the country, families frequently move into and out of neighborhoods, which makes keeping track of who lives within the district boundaries a daunting task. Changing residency from one school district to another is prohibited by Texas law only in cases where the primary purpose for moving is either to participate in extracurricular activities or to evade court-ordered desegregation plans.

School districts have standard procedures for reviewing and accepting applications for enrollment. When an individual applies to a district for admission of a student, the district's administrative staff reviews the application. Applications which appear irregular are investigated prior to admission. However, although the required documents appear to be relatively easy to obtain, there is rarely a reason to challenge an application in which the appropriate documentation is properly presented. Some apparent irregularities, such as a student's having a different surname from that on the documentation, are often easily explained. Because of concern over fraudulent enrollments, each district has a system for ensuring the residency status of its enrolled students. Each campus administration identifies students it believes are not district residents. Identification may be based on attendance records, tips received from other students or parents, or some other means. District officials investigate, and if it is determined that a student is not a resident, the school's principal takes action to disenroll the student. The administrative and investigative staffs, however, are small for the size of the enrolled school population. Therefore, it is difficult to ensure that no nonresident students are enrolled in a district. During the 1992-1993 school year, less than 1 percent of the students in the El Paso ISD were determined to be fraudulently enrolled in the district. Students and their parents have the legal right to appeal an unfavorable ruling through the school system to the president of the school board and through the court system; however, according to school officials, appeals are rare because decisions to disenroll a student are usually based on fairly substantial and irrefutable evidence.

There is no legal way to determine accurately the number of residents of Mexico who are enrolled as students in the El Paso and Ysleta school districts. Essentially, there are three options available to Mexican residents who wish to enroll their child in a school in the El Paso area. Option one is to have the child live in Mexico and commute daily. Option two is to send the child to live with friends or relatives in El Paso during the school year, returning home to Mexico at varying intervals. Option three is to obtain the necessary documentation and pay tuition to enroll the child in either a private school or in an El Paso ISD school.[24]

[24] Unlike other area school districts, nonresident students may legally enroll in El Paso ISD schools by paying tuition.

The school administrators and teachers interviewed for this study considered option one less common than option two because of the inconvenience, expense, and hazards inherent in crossing the border. One might speculate that daily student-crossers are more likely to be older, higher grade-level students. Some option two student-crossers might choose to return to Mexico every weekend, while others might only return to Mexico during extended school holidays such as Christmas. This foster homelike arrangement is not an uncommon practice in Mexican culture and is facilitated in El Paso/Juárez because many Mexican families have members living on opposite sides of the border. Option three is clearly a choice only for more affluent Mexicans.

These three options result in five possible groups of student-crossers. The first group consists of students who enter the United States surreptitiously, lacking appropriate legal-entry documentation. Group two consists of daily student-crossers who enter through a port of entry using a legal entry document, such as the Border Crossing Card. Although the BCC is not intended to be used for this purpose, it is possible for a child to enter the country through a port of entry every day without being stopped. Groups three and four consist, respectively, of undocumented and documented student-crossers who live in the foster homelike circumstances. The possession or nonpossession of legal-entry documents may or may not determine the frequency of crossings during the school year. Group five consists of those student crossers with legal border crossing documents who attend school legally in the United States (e.g., University of Texas-El Paso students with student visas or tuition-paying parochial school students).

Closing the border under Operation Hold the Line might have affected each group differently. We hypothesized that those without documents would be most affected, as the new strategy was designed to prevent people from crossing the border at locations other than the legal points of entry. It appears that long lines, delays, and fear of having one's documents confiscated may have prevented some Mexican residents with legal border crossing documents from crossing during the first weeks of the Operation for such legitimate purposes as shopping and visiting relatives. Nevertheless, while those with documents who used them to cross after the Operation began may have been inconvenienced by long lines, they should have been minimally affected.

Clearly, students without documentation should have faced more significant challenges from Operation Hold the Line. Those who were crossing the border daily without benefit of papers (group one) should have been most affected. Since the Operation began on Sunday morning, some of those in group three may have been in Mexico for the weekend and would have been affected along with the daily crossers. Both groups would have experienced delays in crossing and may have been stopped altogether. However, we heard reports that crossers can evade the Border Patrol, although to do so sometimes means circumnavigating the line. On the other hand, those in possession of legal-entry documentation (groups two, four and five) and those in group three who were on the U.S. side of the border on September 19th, should have been unaffected.

If the Operation was successful in preventing undocumented students from crossing, then daily attendance would have dropped in proportion to the number of student crossers. While a few interviewees recalled some attendance irregularities during the first few weeks of the Operation, records from the El Paso ISD and Ysleta ISD schools do not indicate a significant change in enrollment subsequent to implementation of Operation Blockade. In El Paso ISD, enrollment dropped by 193 students from one week prior to implementation to one week after implementation, three tenths of one percent (.003) of the school district's population and compares to a 112-student drop over the analogous period for 1992.[25] **Table 22** shows changes in enrollment for selected schools (near the border) during the two periods of observation.

[25] Comparison was made of 1993 enrollment at the end of the fourth week of classes (Sept. 9) versus enrollment at the end of the sixth week of classes (Sept. 24) and was contrasted with 1992 enrollment at the same time of the school year (Sept. 17-Oct. 2).

Two schools virtually adjacent to the border showed larger changes. Enrollment at Bowie High School declined by 204 students during that two-week period in 1993 versus a decline of 18 students during the same period in 1992. The net difference is a decline of 186 students. By comparison, the remaining 9 high schools in the El Paso ISD went from a decline in enrollment of 130 students in the observed period of 1992 to a decline of 124 students in the 1993 observation period. That indicates that 6 fewer students left El Paso ISD high schools in the observed period of 1993 than occurred during the same period in 1992. Enrollment at Guillen Middle School changed from an increase of 66 students in 1992 to a decrease of 6 students during the critical period in 1993, a net negative change of 72. The 10 remaining middle schools in the district saw the 1992 decline of 54 students reduced in 1993 to 17 students, a net positive change of 37.

In contrast to Bowie High School and Guillen Middle School, elementary schools along the border experienced smaller changes in enrollments. Hart Elementary School, virtually next door to Guillen Middle School, showed a 1 student gain during the two-week period around the Operation versus a 5 student gain during the comparable period in the previous year. Aoy and Roosevelt Elementary Schools, each within three blocks of the foot of the Good Neighbor Bridge in downtown El Paso, showed enrollment increases in the 1993 study period that exceeded increases during the comparable 1992 period. Total enrollment for all El Paso ISD elementary schools increased by 24 students during the 1992 observation period versus an increase of 158 students during the 1993 period. The difference in gain between the two periods (158 - 24 = 134), when combined with the high school and middle school figures, resulted in a total (negative) change of 81 students between the two periods for the entire

school district. Data from **Table 22** also suggest that those students who cross the border daily, or at least on a regular basis, to attend classes illegally may be older, higher grade-level students. The large changes occurred at the high school and middle school level; there was little change in the elementary schools.

The changes that occurred have induced El Paso ISD administrators to declare that the district lost approximately five hundred students districtwide as a result of the Border Patrol's operation, possibly as many as one thousand, based on annual projections of the growth in enrollment. While losses based on projections are hypothetical, actual changes in enrollment are known to have occurred. **Table 23** shows school enrollments in each of the nine ISDs in El Paso County for the 1992-1993 and 1993-1994 school years, based on figures provided at the end of October each year. While each of the other school districts recorded an increase in enrollment, El Paso ISD is the only district where enrollment declined (by 110 students). While that is only 0.2 percent of the school district population, the percent change is not what is significant. What is critical is that El Paso ISD is the only district where enrollment declined and that Clint and San Elizario, the two districts immediately to the east of the end of the Operation line also showed gains. Those figures indicate that the Operation caused a small shift in school enrollments.

In Ysleta ISD, enrollment remained virtually unchanged around the time the Operation was implemented. During the week prior to the establishment of Operation Blockade (Sept. 13-17), the attendance rate in Ysleta ISD schools was 95.4 percent. During the first week the strategy was in place (Sept. 20-24), the attendance rate was 95.7 percent. School administrators in Ysleta ISD, mindful of the border situation, observed a decline in attendance immediately following the Christmas vacation. However, average daily attendance returned to normal within a week. Some administrators attributed the temporary decline in the attendance rate to parents taking their children for extended Christmas vacations. Numerous El Pasoans visit relatives in Mexico during Christmas vacation and the timing differences between the two jurisdiction's vacation periods often causes attendance fluctuations at the beginning of the new year.

Although school districts are partially funded by local taxes, state and federal governments subsidize local school systems from other tax revenues as well. It is widely believed that local property taxes constitute the main source of revenue for school districts. However, state sales taxes and federal income taxes

also support school systems. Each school district receives funding assistance from the state and federal governments based on the average daily attendance figures submitted by the school districts. In Texas, as in many states, each independent school district imposes an *ad valorem* tax on real property to support its operations, and since the 1986-1987 school year, the average level of local tax rates has risen by 81 percent statewide. As many observers note, both legal and illegal immigrants pay taxes. Illegality of one's residency status does not absolve one of paying taxes. Being in the United States illegally does not prevent one from buying or renting a house, apartment, or other place to live. Home owners and renters (through their landlords) pay property taxes regardless of their immigration status, and residents, both legal and illegal, pay sales taxes on purchases of goods and services.

In an attempt to ensure equality of education throughout the state, funding from state and federal sources is distributed asymmetrically, the intent being that economically disadvantaged districts should receive higher percentages of funding assistance. Each El Paso County school district receives a percentage of state and federal funding in excess of the statewide average for assistance because the county has a relatively high percentage of economically disadvantaged students in its population. **Table 24** lists 1992-1993 school year enrollments for each of the nine independent school districts in El Paso County and shows the percentage of economically disadvantaged students within each district. Nearly 63 percent of the county's students are classified as economically disadvantaged, as compared to 43.6 percent for all students within the state. The smaller districts have even higher high percentages of economically disadvantaged students, particularly San Elizario (96.2 percent) and Tornillo (97.3 percent). These higher percentages justify the provision of such special services as free lunch programs that mean higher costs for the school district and, subsequently, a greater requirement for funding assistance from the state and federal governments.

Table 25, which shows each school district's total funding for school year 1992-1993 and displays the budgeted revenue distribution for each of El Paso County's nine independent school districts, shows each public school district in El Paso County received at least two-thirds of its annual funding from a combination of the state and federal governments for the 1992-1993 school year. By comparison, the mean statewide distribution of state and federal

funding for school districts was 48 percent (41 percent state and 7 percent federal). There is no intent to suggest that school districts knowingly and willfully allow nonresidents to enroll fraudulently. School districts appear to be conscientious in their efforts to identify individuals attempting to fraudulently enroll their children and to disenroll those students found to be fraudulently enrolled. Nevertheless, the method of funding schools and the benefits to the community of universal education provide no incentive for schools to be aggressive in seeking out and eliminating nonresident students.

In summary, the Operation may have exerted a small depressing effect on school enrollments. Whatever the number of Mexican students who were enrolled, however, few students seem to have been crossing the border illegally on a routine and frequent basis to attend school. Thus, any problems of free-ridership that exist in the El Paso school system have more to do with the schools' inability to make accurate determinations of students' permanent residency status than of their border crossing status. More research on the longer-term effects of the Operation that examines the data for the calendar year 1994, which was unavailable, is needed.

Births

Regardless of the status of entry into the United States, Mexican residents use health care services in El Paso, including some who do so in order to establish U.S. citizenship for their newborn. The mayor estimates that $30 million is spent by El Paso's taxpayers to service the education and health needs of nonresident migrants and for law enforcement services because of crimes committed by nonresident migrants. Health officials believe the health problems of the area go beyond the cost of providing services for nonresidents. The county is one of the poorest in the nation and has an extremely high proportion of Women, Infants, and Children Program [WIC] clients largely because of the conditions in extralegal settlements called *colonias.* The county has an estimated 350 *colonias* with about 68 thousand residents. Many exist without proper housing, sewage, water, or electricity due to a combination of poverty levels among the *colonia* residents and the state's restrictions on county regulation. Officials believe the conditions in the *colonias* constitute a serious health risk to the entire population of the county.

Conditions are potentially worsened by circumstances in Juárez, which has no sewage treatment system and where access to adequate housing, potable water, and electricity is limited in most of the city. The effects of industrial air pollution and toxic waste disposal on water quality are increasingly making health hazards worse over time. El Paso Health officials, who occasionally see such diseases as typhoid, tuberculosis, and dysentery that are rare or nonexistent in most other parts of the United States, believe a major health catastrophe in the El Paso-Juárez area is possible, particularly given the amount of commuter traffic between the two cities.

Like schools, hospitals and clinics are prohibited by law from asking questions about citizenship or immigration status. While they may request information about the residential addresses of those seeking services, they do not have the resources to verify the accuracy of the information given. They cannot refuse anyone seeking emergency treatment regardless of their place of residence. While they may charge for such services, their ability to actually collect from both nonpaying nonresidents and residents is negligible.

With regard to the issue of Mexican women giving birth in El Paso, the city demographer, who has constructed a database of all residential addresses in the county and matched those with information provided on birth registration forms, reports that 70 percent of addresses given on birth registration forms do not match any real address in El Paso,[26] a discrepancy believed to result from the relative ease with which Mexican residents can obtain services from such facilities as Thomason General Hospital. For a series of articles for the *El Paso Times*, Emily Jauregui posed during the latter stages of her pregnancy in June 1993 as a Mexican citizen attempting to have a baby in El Paso. She found *coyotes* to smuggle her across the Rio Grande and take her to the hospital or clinic of her choice, health care workers to assist her in filling out forms when she pretended not to speak English, and other expectant mothers in waiting rooms able to provide her with information as to how to apply for welfare benefits (Jauregui 1993a, 1993b).

El Paso County had 17,553 registered births in 1993, a rate that implies that more than 6 percent of all women from the age of 1 to 105 would have had to give birth in any given year if they were all residents of the county (or about 12 percent of all women 15-44 years of age). Such a fertility rate would be extremely high. Some of the deliveries may be for people in surrounding counties, but many are presumed to be for Mexican residents wanting to establish U.S. citizenship for their children. For many years, pregnant Mexican nationals have entered the United States to give birth. Some commentators contend that these women are taking advantage of available health care, while others argue that the reason is to ensure that their children will be born American citizens. Jauregui (1993a) compiled a list of reasons given by Juárez women for having their children born in the United States:

- Better educational and job opportunities are available for a child who is born a U.S. citizen;
- Medicaid, for those who qualify, can pay the full cost of the delivery and postnatal care;
- The Women, Infants and Children program provides free milk, juices and other food for children through age five;
- As a citizen, the child will not be deported from the United States and, many women believe, the mother will generally be ignored by U.S. Border Patrol agents;
- With American children, a family with legal residency has better access to public housing and other social programs.

One method of evaluating the effectiveness of Operation Hold the Line is to analyze birth data to determine if there has been a change in the number of Hispanics born in El Paso County since the Operation's inception. If the Operation has been successful in preventing women from crossing the border illegally to give birth, the numbers of Hispanic births should have declined. Before any de-

[26] Some of the discrepancies are due to minor errors in recording. A sample of records to determine the number that are actually false addresses as opposed to minor discrepancies in spelling, zip code, etc., could be useful in determining a count of those that actually indicate nonresident status.

cline in Hispanic births during the final four months of 1993 can be confirmed as resulting from Operation Hold the Line, seasonal patterns in Hispanic births that suggest that the fall months typically show decreases compared to summer months must be taken into account.

Birth data for El Paso County, provided by the Texas Department of Health, Bureau of Vital Statistics, are available through December of 1993, although the 1993 database is considered only 90-95 percent complete as of this writing. **Table 26** shows the number of Hispanic births per month during the years 1991-1993. **Figure 3** and **Figure 4** graphically represent the data for each ethnic group registered.[27] While the seasonal pattern with respect to Hispanic births is clear, no such pattern appears to exist among the non-Hispanic groups. For Hispanic births (**Figure 3**), the number of births tends to rise from January through August, the peak month for Hispanic births in each of the three years analyzed. The number of births then declines through November, rises in December, and declines in January; the cycle then repeats itself. **Figure 4** represents the data for non-Hispanic births. There is no discernible seasonal trend. As is apparent from **Table 26** and **Figure 3**, there is a systematic trend upward in the annual number of Hispanic births within the county. This is expected based on the trend in population growth.

Figure 5 compares Hispanic births over the three-year observation period. The pattern of declining numbers of births from August through November holds for each year; however, there is a sharper decline in births from September to October 1993, than in the previous two years. Also, comparing the same months from 1991 to 1992 to 1993, almost all showed increases except the post-Operation months. This combination of monthly increases followed by virtually no monthly change or decline suggests that Operation Hold the Line may have deterred pregnant Mexican nationals from crossing into El Paso for the period of time covered by these data. The decline in December 1993 may also be the result of incomplete data. Unfortunately for this

[27] Because the number of Hispanic births is such a large percentage of the total birth count, two graphs are presented. Graphing all data together would have resulted in a scale of such magnitude that the patterns of non-Hispanic birth data would not have been discernible.

Figure 5.

analysis, complete Health Department data for this month is not expected to be ready until July-August 1994. Because of the 90-95 percent completion rate of the data, one would still not expect the final count of Hispanic births to rise to the level of previous Decembers, but one cannot be certain.

What do data on deliveries in Thomason General Hospital reveal? **Table 27** shows the average daily use of Thomason Hospital for a twenty-nine month period, including the post-Operation months of October 1993 through May 1994., indicating an upward trend in the pre-Operation period for the hospital population followed by a downward trend after the Operation began in the twenty-first month in the series. The pattern was similar for all five of the measures in the table including deliveries. The decline in the number of deliveries can be estimated by computing the linear trend in deliveries during the pre-Operation period and projecting those estimates for the post-Operation period. Using this technique, the daily average of 18 deliveries for the post-Operation period is 3.8 deliveries per day lower than expected, which is a decline of 17.6 percent below expectations. We also followed an alternative three-step procedure, the first step of which was to estimate the regression of deliveries on the other measures using the pre-Operation data. The correlation between admissions and deliveries is 0.972, and that is all that is required to estimate the regression equation: Deliveries = -7.66 + .442* Admissions for the period September 1992 through September 1993. The equation provides a good predictor for the post-Operation period as the mean residual is only .03 for the eight-month period.

The second step involved estimating the linear trend on admissions prior to the Operation and using the trend to predict admissions in the post-Operation period had the trend continued. These projections are included in the last column of the attached table. The projected daily admission levels are then entered into the above regression equation in the third step to obtain the estimated deliveries for the post-Operation period. These estimates and the difference between estimates and observed deliveries are also given in the table. This approach yields a shortfall of 2.7 deliveries per day on average (13 percent lower than expected), which is less than, but consistent with the above estimate based on linear trend for deliveries (an estimated decline of 3.9 per day on average). Thus, irrespective of how the estimate is calculated, births come out lower than one would have thought at Thomason General Hospital after the Operation. Interestingly, the shortfall increases the further one goes into the post-Operation period.

In summary, examination of data on both registered births from El Paso county and on deliveries from Thomason Hospital point to the same conclusion: births appear to have declined since the Operation began. Further, these declines occur in the cases one would most expect if the Operation were preventing some women from crossing the border illegally to give birth, namely in the case of women of Mexican origin (whose births are labeled Hispanic births by the Health Department) and in the case of deliveries at Thomason General Hospital. However, the declines are not very large and are based on only a few months of data. More research on this issue as more time passes is clearly needed.

Welfare Utilization

During the initial week of Operation Blockade it was thought that the workload might have dropped at some of the El Paso offices of the Texas Department of Human Services [TDHS] because a large number of recipients caught in Mexico and unable to cross the border could not reach TDHS offices to obtain services. To explore this possibility the El Paso Regional Director of TDHS requested an analysis of the workload at each of the offices in El Paso County for the week of September 20 through September 24, 1993.

The evaluation proceeded in two steps. First, each program manager submitted data on the numbers of TDHS clients failing to keep their appointments [FKAs] for certification or recertification for food stamps, Aid to Families with Dependent Children [AFDC], or Medicaid during that week. This initial investigation indicated no marked difference in workload compared to the same period in other months. Second, three offices (Mills, Stanton, and Clint) were selected for further study due to their

relatively large numbers of FKAs. All cases in which clients failed to keep their appointments from September 17-September 24, 1993 [no explanation is given for the change in the time period] were the subject of home visits by TDHS employees to determine the reason for their absence. Out of 2,325 appointments scheduled, 405 persons failed to keep appointments in the three offices. Of these, 304 either had scheduled new appointments or otherwise resolved their missed appointments before home visits began. This left 101 cases to be investigated. U.S. residency of the applicant was confirmed in all but four cases. In these, the head of household was unable to return from Juárez, Mexico, because of the Operation, although the exact reasons for this are not evident from the report.

Effects in Juárez

According to our interviews with Juárenses, the city of Juárez generally does not appear to have felt any serious increased demand for social services since the Operation began. Reasons for this include:

- The number of illegal crossers now prevented from working in El Paso is small relative to the total Juárez population;

- Illegal crossers live in many different neighborhoods throughout the city;

- Many families have several members in the work force, and it is not typical for all of these to work in the United States.

- Public welfare assistance in Juárez is only minimally available to begin with and people in need don't expect government assistance and, therefore, haven't sought it since the blockade began.

Conclusions

Operation Hold the Line has had a small effect on the delivery of social services in El Paso. With regard to enrollment of children of Mexican residents in the El Paso city school system, it is quite likely that most either have legal border-crossing documents or live with relatives or friends during the school year in the district in which they attend school. These children would not have been significantly affected by the Operation as it primarily discourages people, meaning those without documentation, from crossing the border at other than the official ports of entry. Second, since illegal immigrants who now permanently live in El Paso are residents of their school districts, their children would have been unaffected by the Operation as well.

The Operation had positive side effects on the education system, however. One, cited by virtually every administrator and teacher interviewed, was the increased sense of safety in the school environment, particularly in schools directly adjacent to the border. Prior to implementation of Operation Hold the Line, border-crossers frequently used school grounds, such as at Bowie High School, Guillen Middle School, and Aoy, Roosevelt, and Hart Elementary Schools, to evade Border Patrol agents. School administrators often observed border-crossers loitering around school buildings and playgrounds, changing clothes on school property, and leaving bags of wet clothing behind. Educators, for reasons of safety, often restricted the children from using school grounds. Border Patrol agent chases of illegal border-crossers through the streets of the neighborhoods in which the schools are located often made the streets unsafe for the passage of school children. Since the Operation began, these types of problems have been almost entirely eliminated, resulting in a more secure and less dangerous environment.

With regard to health care, there appears to have been a small effect as well. The change in the population, admissions, deliveries, and emergency visits at the county's hospital (Thomason General) since Operation Hold the Line began suggests a discernible impact. Data on registered births suggest a small depressing effect of the Operation. Data from the TDHS analysis of workload study, however, indicate the Operation had a virtually no impact on the workload of TDHS offices in El Paso County during September 17-24.

VI. Effects on Crime and Related Indicators in El Paso

Local Perceptions and Expectations

The first stage of the analysis of the potential impact of Operation Hold the Line on crime in the El Paso area consisted of interviews with law enforcement and city officials in February 1994. The intention was to take advantage of local knowledge and expertise to suggest guiding questions if not hypotheses to explore in the empirical analyses. Not all the views we encountered were universally shared and not all received support in the data examined. A composite of those first impressions would include the following:

> The crime rate in El Paso was thought to be high, especially for property crime in general, and for motor vehicle theft in particular, but less so for violent crime. The high crime rate was seen as due to:
>
> - The region's relatively poor economic conditions;

- The city's proximity to a larger and substantially poorer population on the Mexican side of the border where there is a market for stolen property exploited by criminal entrepreneurs on both sides of the border; and

- The relatively low ratio of law enforcement officers to population for a city the size of El Paso.

None of our respondents seemed to overstate the problems that the border presents to law enforcement agencies. The border is a problem but it is not the only, or necessarily the most critical, problem for crime control.

The crime rate was seen as escalating dramatically in recent years and as such, perceived as "getting out of hand" in spite of the best efforts of local law enforcement agencies. Increases in crime were viewed as due to:

- El Paso's own urban growth, much of which has been spawned by migration from Mexico at a pace that makes it difficult for the community to respond adequately to its needs, with community resources all the more stressed because of the additional pressures of dealing with a large illegal and/or nonresident population;

- Increased population pressures in Juárez, which remains a relatively poor community compared to El Paso and in which both the access to community services (health, education, and welfare, for example) and the opportunities for predatory criminal activity are greater;[28] and

- As is the case in other large, poor, urban communities, conditions in Juárez that create a large population at risk for criminal activity, many of whom seek opportunities in El Paso, particularly young males and professional criminals (a broad class that seems to include car thieves, drug dealers, prostitutes and others who provide illicit services in the informal economy of the two communities).

Some members of the high-risk population were seen as undoubtedly entering the United States illegally on occasion, thus adding to the problems of El Paso. However, illegals were not seen as the only problem for law enforcement. Most of our respondents took care to point out that they did not believe that all illegals were criminals, or that all criminals entered the United States illegally, or that the Mexican population across the border was culturally more prone to crime than the El Paso population. The preferred interpretation was based on economic conditions.

To the extent any of our respondents were willing to make an estimate of its likely effect, most thought the primary impact of the Operation was on young male offenders and other inexperienced or unprofessional offenders. Those in Juárez who are in crime as a business were thought to be much more adaptable over the long term in dealing with obstacles to crossing the border and more likely to use legal methods to gain entry for illegal purposes. There is a prevailing view that the professional criminal often has official connections that facilitate his criminal activity—connections on both sides of the border.[29]

[28] No other countries that share a common border have a larger disparity in economic conditions than is the case for Mexico and the United States. Juárez and the Mexican state of Chihuahua are relatively better off than other places in Mexico, but the are extraordinarily poor by U.S. standards.

[29] Some misunderstandings about how Mexican law operates may also contribute to a critical view of Mexican authorities from an American perspective. Stolen goods that have entered the country are seized as contraband, for example, and available for state and personal use in Mexico until ownership is settled in court. See Miller (1987) for a commentary on motor vehicle theft in this regard. In spite of a Mexican-U.S. agreement on stolen vehicles that is supposed to prohibit the practice, the custom of using such vehicles for official and personal use remains, and the sight of a Mexican official driving around in a vehicle known to have been stolen in the United States raises more than a few eyebrows among U.S. authorities.

Thus, the Operation might be hypothesized to have a direct, immediate, and, if it can be sustained, long-term effect on:

- Young, male offender residents of Juárez;
- Minor or petty, rather than serious, crime;
- Opportunistic and less-organized, rather than planned or organized, criminal activity;
- Property, rather than violent, crime; and
- Crime in the central downtown parts of El Paso (Police Districts 31-36 and nearby Districts 51-56) that are closely located to the more accessible legal and illegal routes for crossing the border, the area of the greatest cross-border traffic and where the informal economy has been most visible in the past.

The Operation might also have an indirect impact on more serious crime to the extent that law enforcement resources can be redirected from the downtown area to impact teams, gang taskforces, and the like. Eventually this may have an effect on the patterns of serious property crime and on violent crime among young, male offenders regardless of the offender's origins. The more mature and experienced offender is expected to be a constant problem. Indeed, most respondents seemed to believe that both the Operation and any changes in law enforcement strategies they might initiate in response may have only short-term effects. None of the interviewed law enforcement officers doubted the capacity of the serious offender to adapt to changing conditions, particularly as law enforcement resources are stretched thin even in the best of times. Moreover, none believed that chronic offenders are so specialized that an effective crackdown in one area would put them out of business forever. For example, an effective blitz on burglary or motor vehicle theft would be expected to result in a burgeoning larceny-theft rate.

A number of incidents have strained relations among law enforcement personnel on the two sides of the border in recent years. Some observers may believe that the border is a seamless boundary running through a single city, but the cities of Juárez and El Paso appear to be a long way from operating in that manner at the administrative level, perhaps no less the case with respect to law enforcement issues than with health, education, and other shared problems in the two communities. Although none of the officials interviewed reported negative views about the Border Patrol Operation, no one believed that the Operation would improve relations with their counterparts on the Mexican side or that it would facilitate cross-border law enforcement activity.

We do not have data that pertain to all of the issues derived from the interviews. Some of the issues raised require time series data that would extend into the future and others require primary data gathering beyond the project's resources. The points listed above give a fair representation of the initial reaction of a segment of the law enforcement community in the El Paso area concerning the impact of the Border Patrol's Operation on local crime. The expertise reflected in those comments makes them worth considering as they stand. However, we have reformulated those perceptions into six guiding hypotheses to shape our research strategy:[30]

1. The crime rate in El Paso is high due to its proximity to a large and relatively poor Mexican city, particularly with respect to property crime.
2. The crime rate has been increasing in recent years, in part because of the increasing population pressures El Paso shares with Juárez and in part because of the predatory behavior of some illegal entrants to the United States. To the extent the flow of illegals has been uncontrolled, the opportunities for a small, predatory subclass to engage in criminal activity in El Paso have increased.

[30] All of the agencies contacted were extremely cooperative in facilitating our access to information. We are particularly grateful to the Data Processing personnel of the El Paso Police Department, the El Paso City Demographer, and the El Paso County Sheriff's Office.

3. Young, male, poor residents of Juárez constitute a high risk population for some types of criminal activity, mostly in regard to gang activity, minor offenses, and property crime.

4. To the extent that it curtails the illegal entry of the population at risk, the Border Patrol's strategy should have an immediate impact on property offenses and minor crime that should continue over the long term.

5. The largest immediate effect of the Border Patrol's effort will be felt in the downtown areas of El Paso (police districts 30-36 and 50-56).

6. The Operation's initial effects on serious crime may be short-lived as chronic offenders adapt to the new conditions. The Operation may have a long-term effect on violent and more serious crime if it is sustained and if law enforcement agencies are able to redirect resources into those areas as a result of sustained curtailment of the more numerous petty offenses that plague the community.

Trends and the Magnitude of Crime in El Paso

The ratio of law enforcement officers to population in El Paso is low relative to other cities of comparable size in the United States (1.55 per 1,000 population in 1992 compared to 2.76 per 1,000 for 63 cities of 250,000+ population).[31] In 1980, the figure was 1.56 per 1,000 in El Paso and 2.73 per 1,000 in 56 cities of 250,000 or more population. The difference between El Paso and other cities seems to remain constant over time. However, the choice of these particular times as bases for determining differences masks increases and decreases in between, a extremely important point in assessing crime trends in general and for assessing speculations about El Paso trends as reported in the press during the months before this study.

If the ratio for El Paso remained constant from 1980-1992, any increase in crime rates could not be attributed directly to a deterioration in law enforcement manpower, the only easily accessible measure of law enforcement. If it were constant, the low ratio of law enforcement personnel to population in El Paso might be a factor in accounting for a high rate of crime but not for variations in rates over time.[32] We might conclude then that, in spite of rapid, urban growth and migration, legal or otherwise, the number of law enforcement officers has kept pace with population growth, and changes in crime rates must be due to such other factors as increases in the size of the population at risk for criminal behavior because of lax border control.

The data present a different picture. As our interview respondents indicated, law enforcement numbers, and presumably law enforcement effectiveness, declined during the 1980s to a low of 1.31 per 1,000 population for the City of El Paso in 1988. Only in recent years has the ratio climbed back to the 1980 level.[33] For nine of the thirteen years in the period, the El Paso ratio of police manpower to population hovered around 50 percent of the national average. At the same time, of 120,432 foreign born residents in El Paso in 1990, 35 percent entered the country during the 1981-1990 decade, more than half of whom entered after 1985.[34] INS apprehension data suggest that illegal entry into the United States also increased substantially at the turn of the decade. Differentiating between the effects on crime rates of variations in law enforcement manpower and qualitative changes in the population is beyond the capabilities of the data at hand, although it is clear that increases in the serious crime rate outpaced both population growth and enforcement manpower in the past decade.

[31] Federal Bureau of Investigation, *Uniform Crime Reports*, 1992.

[32] Clearly a larger city may be qualitatively more difficult to police than a smaller city and that may also account for deteriorating conditions in spite of constant police manpower. However, an independent measure of the qualitative difference would have to be introduced into the analysis.

[33] The 1990 ratio may be partly an artifact of the census undercount for El Paso for that year (18 thousand according to the *U.S. Census Post Enumeration Survey*).

[34] *U.S. Census of Population*, 1990; data provided by El Paso City Demographer.

Myths and Nonmyths about High Crime Rates. Irrespective of the presumed increase in criminogenic conditions, perceptions of the city's high crime rate are more myth than reality. The city's rates for serious, especially violent, crime[35] are relatively low compared to cities of comparable size. El Paso's total crime rate ranks thirtieth among the forty U.S. cities of comparable size in 1992 (**Table 28**). El Paso ranks thirty-first among the forty cities in motor vehicle theft, and is above the mean for the forty cities only on larceny-theft (ranking thirteenth but within 10 percent of the mean for all cities). The murder rate is little more than one-third of that for all the cities and 12 percent lower than the national average. We were told that only one police officer has been feloniously slain in the line of duty in El Paso since 1957. Few other cities of comparable size would average less than one officer killed per decade during that period.

Some law enforcement officials attribute the low rate of violent crime in El Paso, in part, to a relatively low propensity for crime in the Hispanic population, particularly for violent crime. Apparently the murder rate in Juárez is comparable to that of El Paso and a fraction of the rate in large metropolitan areas of the United States. Hispanic offenders are perceived to be less likely to be armed than Anglo or African-American offenders, although that may be less the case in recent years, particularly as weapons become more accessible economically among young offenders involved in gang activities throughout the city.[36] Other officials attribute the low crime rates to an effective crime control strategy using impact teams that concentrate on repeat offenders and on crime in specific areas of the city. For example, the rate of reported burglaries declined by 55 percent from 1988 to 1993 after a repeat offender program was introduced by the El Paso Police Department specifically to deal with that offense.

The local myth that El Paso is a high crime city is sustained in part by comparisons of El Paso with national Metropolitan Statistical Area [MSA] data or such data for other Texas MSAs, but such comparisons are misleading. MSAs are heterogeneous units. U.S. southern border cities tend to be more urbanized than other U.S. cities (87 percent of the population in the El Paso MSA lived in the city in 1992, two times the 43 percent national average for all MSAs).[37] Urban areas have both more opportunities for criminal activity than rural areas and larger populations at risk due to the social and economic con-

[35] Murder and non-negligent manslaughter, forcible rape, robbery, aggravated assault, burglary, larceny-theft, and motor vehicle theft are the seven categories of serious crime used by the Federal Bureau of Investigation as the major indicators of criminal activity and trends. The seven categories are assumed to be the crimes most likely to be reported to the police, although, with the exception of murder and possibly motor vehicle theft, they tend to be underestimates of the actual number of offenses as reported in victimization surveys for example. See O'Brien (1985) and Biderman and Lynch (1991) for a description of the history, procedures, strength and weaknesses of the Uniform Crime Reporting system, crime victimization surveys, and alternative measures.

[36] American impressions of high rates of violent behavior in Mexico seem largely based on reports about Mexico City, which has an exceedingly high rate of violent crime according to Interpol statistics.

[37] The El Paso MSA is one of the most urbanized in the nation. Only four other MSAs have more urbanized populations, and three of those are in Texas including the border city of Laredo which has the highest rate in the nation (92 percent). Personal and ethnographic accounts of crime in the border region often illustrate differences in the nature and style of criminal activity compared to other metropolitan centers in the United States. Those differences, some of which are quite striking to those who are unaccustomed to life in the informal economy, may also lead to false impressions about the magnitude of crime. Visibility and difference say nothing about magnitude, and that, in part, may account for the apparent fear of crime in the El Paso area. Street vendors and panhandlers may be a nuisance to some, but they do not present the same danger to public safety as burglars or bank robbers.

Note: Murder includes nonnegligent manslaughter in all tables throughout this chapter. The violent crime index is sum of murder, forcible rape, robbery, and aggravated assault. The property crime index is the sum for burglary, larceny-theft, and motor vehicle theft. The total crime index is the sum for all seven categories of serious crime.

Source: Federal Bureau of Investigation, Uniform Crime Reports, 1992

ditions that nurture crime. To illustrate using the MSAs for which data is available for 1992:

	El Paso MSA	Border MSAs[38]	Texas MSAs	U.S. MSAs
Density (population per square mile)	584	369	251	334
Population under 18 years of age (%)	33	31	27	26
Per capita income ($)	10,008	13,281	15,342	15,342
Unemployment rate (% of labor force)	10.2	5.5	6.4	5.5
% of population in central cities	87	62	59	43
Number of MSAs	1	14	17	261

Any comparison of differences in crime rates among MSAs would have to consider differentials in such risk factors. Even a comparison between El Paso and other Texas cities is misleading because, among the eight Texas cities of 250 thousand population or more, only Houston and Arlington have lower crime rates than El Paso, and even those differences are slight (Federal Bureau of Investigation 1992).[39]

The perception that young males disproportionately contribute to serious crimes rates is well grounded according to Uniform Crime Report data on arrests.[40]

Given the concerns expressed to us about increasing gang activity and youth crime in El Paso and the proximity to a large and substantially poorer community across the river, we expected to find that the city would be above the national average on such figures. That seems not to be the case. Contrasting El Paso's 1993-1994 arrest rate for juveniles (as a percent of all arrests) with national figures for 1989, we find:

Percent of all arrests of persons under 18 years of age.

	El Paso (1993-1994)	United States[41] (1989)
Murder	5.6	12.3
Forcible rape	8.4	15.4
Robbery	13.1	23.0
Aggravated assault	10.2	13.3
Burglary	19.7	31.9
Larceny-theft	20.4	28.7
Motor vehicle theft	6.4	40.9
Total	13.6	27.3

Unless there has been a dramatic downturn in juvenile arrests nationwide over the past few years, it would appear that El Paso's juvenile problem is proportionately less than the situation in most other metropolitan areas in the United States. If youth from Mexico are adding to the crime problem in El Paso, it is not apparent in the data for serious offenders.

Although El Paso crime rates are relatively low compared to other cities, the total crime rate for serious offenses increased 41 percent in El Paso from 1982 to 1992 (**Table 29**). The population increased 17 percent but the total number of serious crimes increased 65 percent, with most of the increase due to larceny-theft and motor vehicle theft. The total crime rate for El Paso grew faster than any of the other **f**orty-eight cities of comparable size identified in **Table 29**. Of the forty-eight cites listed, only Virginia Beach, Virginia, had a total crime rate lower than El Paso's in 1982. It is this rapid increase that

[38] These include all MSAs within approximately 100 miles of the U.S.-Mexican border in Arizona, California, New Mexico, and Texas.

[39] We have yet to locate the figures, but we are told that the number of people deported for criminal violations per year is less than 1,000, most for drug offenses. Given the millions of serious crimes committed per year, that is not a large number, although it tells us nothing about the institutionalized population.

[40] See Sutherland, Cressey & Luckenbill (1992, Chapter 8) for age specific arrest rates in the United States.

[41] Sutherland, Cressey & Luckenbill (1992:155, derived from Federal Bureau of Investigation, *Crime in the United States,* 1989:188).

Table 29.

must give rise to the local concern about rising crime. The increase has been dramatic relative to the previously low base, but El Paso still remains in the lower end of the spectrum for cities of comparable size. The reasons for the increase in crime rates in the El Paso area during the 1980s remain unclear. It should be possible to develop a data set that allows an assessment of changes in the urban context that led to such rapid increases in crime rates. Clearly, in-migration flows and the source of such flows should be included in such an analysis.

Myths about the Criminogenic Border Condition. Disregarding its relative position, why is the crime rate in El Paso as high as it is? One argument might focus on the criminogenic conditions El Paso shares in common with other U.S. cities. It is quite another thing to argue that the proximity to the border exacerbates those conditions. **Table 30** presents the results of regression analyses on violent crime and property crime for 244 MSAs. The first eight variables in the list (percent of the MSA population that lives in the urban area to percent of the labor force unemployed) provide crude indicators of urban conditions that are known to have high correlations with crime rates and have relatively straightforward interpretations. Percent black, percent Hispanic, and the ethnic/racial homogeneity index provide indicators of variations in the racial/ethnic mix of MSAs. The last three variables assess the variation in crime rates due to an MSA being located within 100 miles of the U.S.-Mexican border or in Texas (if not on the border) or in another border state (Arizona, California, or New Mexico). A negative value for the coefficients indicates that a variable is associated with a decrease in the crime rate, a positive value indicates that a variable is associated with an increase in the crime rate.

In general the results indicate that, when urban conditions are held constant, the percent Hispanic has a negative relationship with violent crime but nearly as high an impact as percent black on the property crime index. More importantly, the border effects, statistically speaking, are all negative for violent crime and largely so for property crime. If the data suggest anything about the border's impact on crime, it is that crime is lower on average in border areas than in other U.S. cities when the characteristics of the urban population are held constant. As indicated above, we do not have the resources required to look at the potential border effects on variations in crime rates over time when changes in urban conditions are held constant. The result of the synchronic analysis is quite clear however. If there is anything particularly criminogenic about the border, it is not reflected in the data, and that tells us a great deal about the difficulty of basing understanding purely on local perceptions, myths, and impressions, which necessarily have a limited basis for comparison spatially, if not temporally.

Serious Crime

The Reality of Recent Trends in El Paso. The trend for property crime in El Paso in recent years has been downward. The trend is quite evident in the annual percent change in rates presented in panel (B) of **Table 31**. The property crime index has been declining since 1990, burglary since 1988, and larceny-theft since 1989. Motor vehicle theft went down in the early part of the 1990s, and robbery may have started to decline just prior to the onset of the Border Patrol's Operation. The experience in El Paso mirrors a national trend in declining crime rates, particularly with respect to property crime. See panel (C) **Table 31** for a comparison of the most recent national data available. Clearly, an attempt to assess the magnitude of the effect of the Operation on crime in El Paso would have to take recent trends into consideration.

The last row of panel (B) **Table 31** gives crime projections for 1994 based on the October 1993 to February 1994 post-Operation period, disregarding seasonal variations and assuming that low values for that period will be sustained throughout the year. This provides the most hopeful scenario of an Operation effect based on current data. The negative swings are substantial, in double digits in most cases. However, each of the indicators has at least one double digit swing in an earlier time period. Nevertheless, the pattern appears impressive. Three out of the four violent crime indicators are down, but that also occurred in 1982-1983, 1984-1985, and 1986-1987. Similarly, three of the four property crime

Table 30.

REGRESSION ANALYSIS OF VIOLENT AND PROPERTY CRIME INDEXES:
U.S. METROPOLITAN STATISTICAL AREAS (1992)

		Criterion Variable

X11	Homogeneity index	-10.72	-30.44
X12	Border MSA	-73.09	-39.47
X13	Texas MSA	133.72	1.24
X14	Border State	-264.24	-1379.47
Constant		-743.88	3297.37
RSQ		0.51	0.43
n		244	237
Mean		660.22	5199.71
Standard deviation		347.21	1499.96

Notes: The Homogeneity Index (X11) is a measure of racial/ethnic homogeneity varying from 0 to 100; the higher the value, the more homogeneous the population. It is the observed standard deviation for percent white, black, other race, and Hispanic divided by the theoretical maximum standard deviation for a percentage distribution with four categories. X12-X14 are dummy variables with a value of one if a city is in a category and zero otherwise. The categories are mutually exclusive with border MSA, Texas MSA, and other border state MSA being classified in that order. Cell entries for predictor variables are unstandardized regression coefficients.

Source: Federal Bureau of Investigation, Uniform Crime Reports, 1992; U.S. Census of Population, 1990.

indicators show substantial declines, but that, too, occurred in 1981-1982, 1982-1983, and all three were down in recent years, 1990-1991 and 1991-1992. In 1990-1991, the number of offenses known to the police declined by 7,233. Our best estimates for the likely 1993-1994 decline range between 5,873 and 7,750. The most optimistic figure is not likely to be much larger than the drop experienced four years ago. Thus the current patterns in the Operation period (October 1993-February 1994) are not without precedent in the pre-Operation period. There was also another prior period in which six of the seven indicators declined from one year to the next: 1982-1983. It seems premature to claim, then, that the 1993-1994 shifts are unprecedented in the recent history of the community. The fact that current patterns are not unique raises doubts about the impact of Operation Hold the Line on crime in El Paso unless the observed differences are substantially larger than prior swings.

Observations on the Post-Operation Period. The

Source: El Paso Police Department

El Paso Police Department provided us with a two and one-half year period of monthly returns that they submit to the Texas Department Public Safety as part of the FBI's Uniform Crime Reporting Procedure.[42] Summaries of these data for the seven index crimes are presented in **Table 32**. Panels (A) and (B) give means and average percent changes in the number of offenses known for specified periods. In particular, the October 1993 to February 1994 period provides the five-month averages for each of the crime index counts for the post-Operation period to contrast with earlier periods. The patterns are consistently down for the post-Operation period. But are the differences so unusual that a claim can be made for an Operation effect? Some simple arithmetic provides a partial answer.

Overall, there are 519 fewer offenses reported on average for each month during the post-Operation period (October 1993 to February 1994) than for the same period one year earlier (3499 - 4007 = 519, or a 13 percent decline from the October 1992-February 1993 period). Multiplying that figure by 12 gives the expected reduction in the total number of offenses for an entire year (6228). However, note that the decline in the total crime rate was from 11,239 in 1990 to 9,630 in 1991 (see **Table 31**), a 14 percent decline over 1 year. Since both figures are based on number of offenses per 100,000 population, multiplying each by the respective population estimate for that year and dividing by 100,000 gives the number of offenses, 59,919 for 1990 and 50,686 for 1991, a difference of 7,233 for the year or an average of 603 per month, a 14 percent larger reduction per month than the 519 reduction during the post-Operation months.[43] This analysis is not elegant, but it is instructive. Larger downturns in the crime rate have been observed in El Paso in recent years than were observed during the first five months of the Border Patrol's Operation. It is not clear that the earlier downturns in the crime rates were noticed or that local law enforcement agencies received any kudos for those prior shifts.

A Technically Rigorous Approach with Equally Ambiguous Results. Just as it is too early to credit Operation Hold the Line as an essential element in any border city's crime control strategy, it is also too early to be dismissive. Multivariate statistical procedures are available to analyze trends over time. Estimates of effects can depend on the length of the available time series and the trend line that is used to make forecasts, but the process is technically and theoretically sounder than best guesses based on contrasts for only two points in time. **Table 33** contrasts the results for four different models that take into consideration trends over time as well as seasonal variations in the seven major crime rates. The analysis is based on monthly reports of offenses reported to the El Paso Police Department, and the models differ only in terms of the time periods used to estimate the trends and seasonal effects. The estimated effects during the post-Operation period are fairly consistent throughout the analyses.[44]

Based on the pre-Operation data only, each model estimates a linear trend and the last two models include estimates of seasonal trends. These estimates are then used to forecast the number of offenses for the post-Operation months. Differences between the predicted and observed number of offenses for the post-Operation period would indicate the extent to which the post-Operation data could not be estimated by prior trends (or by trends and seasonal effects in Models III and IV). These differences are provided for each category of crime in

[42] At the time of this writing, data should be available for the months of March-June 1994. Analysis of the additional four months plus monthly data going back at least as far as January 1990 would eliminate much of the random noise in the time series and allow greater confidence in the outcome of the analysis than is possible with the current data set.

[43] A simpler strategy, of course, is to go to the Uniform Crime Reports for those years and read the figures presented in the tables.

[44] Interrupted time series procedures were used with estimates based on the pre-Operation periods for Models I - III. Common modeling procedures were considered in terms of ARIMA analysis as was the case for the apprehensions data considered elsewhere in the report. A first order autoregressive structure was controlled for in four of the seven categories of crime in the Model I data. The result of all that effort is that, no matter which approach is used to model the effects of trends and seasonal variations in the offenses reported to the police, the findings are similar, with declines in most of the offense categories during the post-Operation period that are independent of trends and seasonal variations.

Table 33.

ESTIMATES OF POST-OPERATION EFFECT ON MAJOR CRIME
FOR FOUR MODELS OF TREND AND SEASONALITY

	Model I Long Term Trend Effect	Model II Medium Term Trend Effect	Model III Short Term Trend + Seasonal Effect	Model IV Short Term Trend + Seasonal Effect
Estimates Based on Period from:	1980-1993	1988-1993	Sep 91-Sep 93	Sep. 91-Feb 94
A. RSQ for Trend and Seasonal Effects				
Murder	0.04	0.01	0.56	0.54
Forcible Rape	0.29	0.07	0.36	0.38
Robbery	0.70	0.39	0.37	0.53

* Probability < .10
** Probability < .15

Note: Negative differences in panel C indicate a decline in crime rate beyond that predicted by trends or seasonal variations prior to the Operation.

Source: Federal Bureau of Investigation, Uniform Crime Reports, 1980-92; El Paso Police Department for 1991-94 monthly crime report data.

panel (C) of **Table 33** for each model.[45] As was the case in the inelegant analyses presented earlier, if the differences are negative, they indicate the magnitude of the decline in offenses that cannot be attributed to trend and/or seasonal variations. If the differences are positive, they indicate the magnitude of the increase over what would have been expected given trends that started before the Border Patrol Operation began.

- Model I estimates the trend for each category of crime over the long term starting with the 1980 data and running through September 1993. As rates had been increasing over the majority of the period considered and declining only in recent years, this model probably exaggerates the apparent effects of the Operation.

- Model II estimates trend focusing on the medium term, from 1988, the year that seemed to initiate a sequence of downturns in the property crime rate, through September 1993.

- Model III estimates trend in the short term, from September 1991 through September 1993, and uses the monthly data to estimate seasonal effects.

- Model IV uses the entire short term series of thirty months from September 1991 through February 1994, again with seasonal estimates. Model IV would minimize the observed effect during the post-Operation period.

Using a long-term trend (Model I) does seem to exaggerate the post-Operation statistical effect on property crime rates. This is not surprising since we had observed a recent downturn in both burglary and larceny-theft.[46] Using the entire series (Model IV) minimizes the post-Operation effect and provides a lower bound. Although the differences may not be statistically significant, the overall pattern in Model IV is consistently down for most violent and property offenses. Thus, the minimum case still exhibits a downturn for the post-Operation period. With the exception of burglary, the estimates for the other two models are extremely consistent. The bottom line is that the when short-term trend and seasonal factors are controlled, overall crimes rates are down by more than 420 per month on average, and both aggravated assault and motor vehicle theft in particular are down more than could be explained by previous trends.

Below are the results for total crime index for the five post-Operation months using a model that relies on the period from 1990 to estimate recent trends and seasonal patterns. The observed number of offenses for each month is decomposed into the number of offenses predicted by the trend, the expected number of offenses to be added or subtracted from the trend component given seasonal variations observed in the series, and a remaining component that cannot be explained by either trend or seasonal variation. Thus, there were 3,650 offenses in October 1993; 3,758 were expected given the declining trend since 1990. The month of October is typically up 66 offenses over the trend. Trend plus seasonal component give a predicted number of offenses for the month: 3,824. The observed value (3,650) minus the predicted value (3,824) gives the remainder. The observed value was 174 offenses lower than would have been predicted by trend and seasonal variations alone. It is the magnitude of that remainder that should tell whether there is something unusual happening. The total for the five-month period, 407 fewer offenses committed or 81 fewer per month on average, is smaller but consistent with the other medium to short-term models considered.

The total number of offenses were a bit higher two years earlier, but the declines that were not predicted by trend or seasonal effects (the remainder) in the five month period in 1991-1992 (down 162 offenses per month) were twice those observed in the first five months of the post-Operation period (down 81 offenses per month). Given the consistency of these results, it is difficult to say that some-

[45] Panel (A) gives the squared multiple correlation coefficient and indicates how well the trend line and seasonal variables predict the number of offenses for each month throughout the time period. The regression coefficients for trend in panel (B) indicate whether the trend is rising or declining during the specified period.

[46] A cubic model provides a better fit for that curve, but that degree of elegance is probably not justified by the data or by any theoretical reasoning underlying such a model for this data.

Summary of trend analysis results for the post-Operation period:

Month	Observed number of offenses	Number predicted by trend	Seasonal component	Predicted Number	(Observed-Predicted) Remainder
Oct	3,650	3,758	66	3,824	-174
Nov	3,711	3,735	-146	3,589	122
Dec	3,581	3,711	-127	3,584	-3
Jan	3,468	3,689	-128	3,561	-93
Feb	3,030	3,666	-377	3,289	-259
Total	17,440	18,559	-712	17,847	-407
Average	3,488	3,712	-142	3,569	-81

Summary of trend analysis results for a five-month periuod two years earlier (1991-1992 using the same estimates for trend and seasonal components as for the post-Operation period:

Month	Observed number of offenses	Number predicted by trend	Seasonal component	Predicted Number	(Observed-Predicted) Remainder
Oct	4,173	4,307	66	4,373	-200
Nov	4,071	4,284	- 146	4,139	-68
Dec	3,916	4,261	-127	4,134	-218
Jan	3,872	4,238	-128	4,110	-238
Feb	3,752	4,215	-376	3,839	-87
Total	19,784	21,305	-710	20,595	-811
Average	3,957	4,261	-142	4,119	-162

thing extraordinary is happening with respect to serious crime due to the Operation.

These results are suggestive, not definitive. The time series is too short, particularly for the post-Operation period. Nevertheless, the results are indicative. At least to this point in time, it appears that the Border Patrol's strategy may directly or indirectly have some impact on serious crime in the El Paso region. Several criteria would have to be met to provide a persuasive case that those who gain illegal entry into the United States or who are nonresident in the United States contribute disproportionately to the rate of serious crime in border cities and that the Operation is having a direct effect on serious crime in El Paso:

- The declines in the crime rates would have to be unprecedented, which is not the case at present;
- If not unprecedented, the declines would have to larger than those previously experienced, which is not the case at present;
- The declines would have to be sustained significantly below levels that could be expected by recent trends and seasonal patterns, as yet not the case;
- Variations in the rates of crimes along the border should vary in proportion to the illegal flow along the border (we have insufficient information to speak to that issue);[47]
- Direct information on citizenship, residence status, and entry status on apprehended offenders

[47] We attempted a preliminary analysis of the relationship between INS apprehensions and offenses known to the police after the effects of trend and seasonality had been removed from both. There is a small statistical relationship between aggravated assault and total INS apprehensions: for every 200 increase (or decrease) in apprehensions, the number of assaults increases (decreases) .5 in the detrended series. The series we have on arrests is too short to remove seasonal effects, but, again, there is a modest statistical relationship between aggravated assault and the detrended INS apprehension totals: an increase of 1.4 arrests for every 100 INS apprehensions. A longer time frame is needed to tease out the possibility of a relationship worth pursuing, particularly given the prospect of lagged effects between apprehensions and offenses.

should demonstrate a declining contribution after the Operation's inception to the arrest rates of individuals who are noncitizen, nonresident, and without legitimate entry into the country (we have no information that addresses this issue.

Geographic Distribution of Crime

Distribution of Arrests. Public perception in El Paso is dominated by a view that the crime problem has been getting worse, and the evidence presented above supports that view over the long-term, although some property crime rates appear to have declined in recent years. Some of the past increase may have been due to changes in the age and sex distribution of the resident population and in changing economic and social conditions in the area. During the 1980s much of the city's growth has been affected by migration patterns due to its proximity to a large Mexican population across the border, and many people believe that undocumented aliens are the source of the increase in serious crime in El Paso and that the increasing number of undocumented aliens is due to the U.S. government's inability to control the border. This impression probably is bolstered in part by the unusually low recovery rate for motor vehicle theft in the city[48] and by the number and dollar value of motor vehicles stolen in the United States that have been recovered south of the border by the FBI in cooperation with Mexican law enforcement agencies.

The serious criminal activity in the city is disproportionately located in City Representative District 8, which follows the U.S.-Mexico border throughout the south and west side of the city of El Paso and includes the main bridge crossing points in the downtown area.[49] In the first nine months of 1993, 41 percent of all felony arrests in the city occurred in that district. When the arrest data are linked with census information on municipal regions, the central area has the highest arrest rates as expected. Some contributing factors are easy to identify. Both per-capita income and median family income in the central region are about two-thirds of those for the entire city. The central area has a younger population and a higher proportion of residents twenty-five years or older with less than a ninth grade education. By these measures, the economic and social status of the population is worse than for the city as a whole. The central area also has a high proportion of Hispanic residents, although some parts of the area have an even a higher proportion with similar economic status, older perhaps, but more poorly educated, and substantially lower arrest rates on all measures except prohibited weapons offenses.

Distribution of Complaints. In addition to serious crime, we were told that a great deal of highly visible petty criminal activity (e.g., vandalism, shoplifting and other petty theft, prostitution, minor drug offenses, aggressive panhandling and begging, and illegal street vending) also has been concentrated in the central downtown district. The Border Patrol's operation may have had only a small effect on major crime, but many observers apparently think the community is safer now than before.

The public view may be shaped by the reduction in petty offenses in the downtown area, much of which apparently involves youthful offenders. That view is supported by the reduction in incoming complaint calls monitored by the El Paso Police Department over an eight-week period when the Operation first

[48] El Paso's recovery rate was about 43 percent in the 12 months before Operation Hold the Line began compared to about 60 percent for Texas cities (see Miller 1987 for a comparison between Texas cities and motor vehicle theft in border cities in the mid-1980s). The recovery rate in El Paso increased to 64 percent in the five months after the Operation started. Although the annual motor vehicle theft rate remained fairly constant at about 500 per 100,000 population, the recovery rate for El Paso declined from about 81 percent in 1976 to about 40 percent from 1986. Since that time, the rate of thefts has doubled with no appreciable increase in recoveries.

[49] Police districts 31-36, 42, 44, 51, and 54. There are six other police districts on the border scattered through four city representative districts.

[50] A sharp reduction in 911 calls and accidents in week eight suggest that a seasonal variation may account for the reduction observed in some of the categories in that week as neither would be expected to go down so precipitously. The number of alarms, silent and audible combined, provide an automatic measure of variation in property crime that tended to decline during the eight-week period independent of law enforcement activity.

began.[50] Most of the reduction in incoming calls came from the downtown police districts and occurred in all categories with the surprising exceptions of shoplifting, prowlers, and sex offenses, as some of our respondents led us to believe these offenses were among the first to decline. The decline in the proportion of all petty offenses and nuisance complaints coming from the downtown area substantiates the impression that some of the population at risk, most probably youthful offenders, have been turned back at the border. The data may reflect some seasonal variation during the period of the study undertaken by the El Paso Police Department as well, but the initial impact appears to confirm most expectations.

The early impact on minor crime is substantiated by the activity reports of the Anthony Police Department to the west, the Horizon City Police Department to the east, and the University of Texas at El Paso Police Department (near the Mexican border in the southwest corner of the city). Apparently Mayor Francis was sufficiently impressed by the reduction in minor crime observed in the early stages of the Operation to shift sixty-five police officers from the downtown area into a newly established gang taskforce. He appears confident enough about the Operation's long-term prospects that he has invested community resources in a cleanup campaign for the downtown area to revitalize economic activity in that part of the city.

On other fronts, federal authorities indicate that criminal alien cases appear to have declined since the Operation began; bridge apprehensions (mainly drug trafficking) have increased; river apprehensions are down; and criminal activities have increased on the perimeters of the Border Patrol's Operation (near Fabens, Texas to the east and New Mexico to the west). They have no illusions that major drug traffickers will not be able to adapt successfully to the new situation.

Juvenile Offenders and the Racial/Ethnic Distribution of Arrests

We examined the arrest rates of juvenile offenders for serious crime, contrasting the differences in monthly average number of arrests for the post-Operation period with the same five-month period one year earlier. Again, this type of contrast ignores any trends that may have been present prior to the onset of the Operation and can only identify contrasts that may be consistent (or inconsistent) with expectations about the Operation's potential effect on crime. The underlying causes of the differences remain uncertain. In particular we have no direct information on the citizenship or resident status of offenders.

Although the number of juveniles processed for all offenses, including serious crime, increased by 23.5 percent compared to the same period one year earlier and the number referred to court increased by 40.3 percent, the number of arrests for serious offenses were down for both violent crime and property crime (the numbers in individual categories of offense are too small to be meaningful with the exception of aggravated assault and larceny-theft, both of which are down on the previous year's figures). The results suggest a significant decline in juvenile involvement in serious crime. The difference cannot be explained by less vigilance on the part of the police department given the substantial increase in the number of juveniles being turned over. But, there is a perplexing caveat. Juvenile arrests for serious offenses did not decline disproportionately as might be expected. The proportion, 4.2 percent of all arrests for serious crime involving juveniles, was up marginally compared to the same period one year earlier. The number of arrests of adult offenders, most probably young adults, must have declined in tandem.

From our respondents' comments, we would expect juvenile arrests to be down for minor offenses, disproportionately so for Hispanics to the extent their entry to El Paso has been restricted by the Operation. **Table 34** identifies the contribution to changes in average arrest rates of seven categories of crime by race, ethnicity, and age group. Reading from right to left in the top row, there were sixteen fewer arrests for major violent crimes on average October 1993 to February 1994 compared with the same five-month period one year earlier (October 1992 to February 1993). Juvenile arrests declined by nearly nine

Table 34.

Source: El Paso Police Department

per month and adult arrests by seven per month. Arrests of Hispanics for major violent crimes were down eleven per month, which is more than the decline for blacks and white non-Hispanics combined. The number declined more for young Hispanics (by about seven per month) compared to adults (about four per month).

Such a result is consistent with expectations about the Operation's effect on young Hispanics. That is not the case for any other category. Arrests tend to be down generally more for older than younger offenders in all race/ethnic categories and for older Hispanics more than any other group. Arrests for minor property offenses and minor violence increased, and arrests for vandalism increased considerably for young Hispanics. Arrests for sex, drugs, and public order offenses are down for adults in all race/ethnic categories and especially for adult Hispanics. There is a juvenile effect, particularly for Hispanics, but more for serious than minor crime. There is an Hispanic effect relating to minor crime, but more for adults than juveniles.

The evidence supports the thesis that juvenile offenders are being restrained with respect to serious crimes, Hispanics more than blacks or white non-Hispanics, but possibly as an outcome of the additional resources available for the gang taskforce. There is little support in the arrest data for the sort of effects predicted by our respondents in terms of the role age group plays. There is considerable support for the notion that public nuisance activities may be down with the possible exception of vandalism, but juvenile offenders appear less responsible for the downturn than was anticipated although the effect of young adults is obscured in this analysis.

Cost of Crime

We also examined data relevant to assessing changes in the cost of crime. With the exception of forcible rape, burglary, and larceny-theft, the police clearance rates increased in the October 1993 to February 1994 period compared to the same period one year earlier (**Table 35**, panel A). Clearance rates for motor vehicle theft more than doubled. Thus, not only are most offenses down compared to a year earlier, the apprehension rates improved for some violent and property offenses. This may suggest that the redirection of police resources from minor and petty offenses to more major crimes was fruitful, or it may be a trend that started some time ago; we do not have sufficient data to resolve the issue, and it would be useful to know whether there was a similar pattern during the 1990-1991 downturn.

The cost of crime to the community involves more than property losses, but property losses, a visible measure of changing conditions, were down during the post-Operation period in all major categories: robbery, burglary, larceny-theft, and motor vehicle theft (**Table 35**, panel B). Equally important, both the value and the percent of property recovered increased. The patterns are too consistent to ignore and are consistent with the hypothesis that crime control, as measured by property losses, improved during the post-Operation period. Again, in the absence of a longer time series,[51] it is not clear whether the recent declines can be attributed to indirect or direct effects of the Border Patrol's activities or to trends in law enforcement effectiveness begun before the Border Patrol shifted its strategy.

Most of the property lost to criminal activity in the region comes from motor vehicle theft (70 percent of the total value of stolen property in the October 1993 to February 1994 period). That, and the rise in motor vehicle theft of 138 percent from a low of 460 motor vehicle thefts per 100 thousand population in 1983 to a high of 1094 per 100 thousand by 1990, probably accounts for the community perception that motor vehicle theft is high. It is no solace to those whose cars go missing to learn that the motor vehicle theft rate is low relative to communities of comparable size in the United States. In 1992 El Paso ranked thirty-first in motor vehicle theft among the forty cities of comparable size (Table 28).[52]

---

[51] In particular the series should include the period around the time of the previous large downturn in 1990-1991.

[52] See Miller (1987) for a comparison of trends in motor vehicle theft among border cities in Texas and for a description of how border theft rings operate and the responses of law enforcement agencies on both sides of the border.

Table 35.

VARIOUS MEASURES OF COST OF CRIME

It should come as no surprise that our data bear out local perceptions of the decline of motor vehicle theft in the early part of the post-Blockade period. Both the number of vehicles stolen and the total value of the community's loss are down compared to the same period one year earlier (**Table 35**, panel C). About 43 percent of vehicles were recovered in the year prior to the Operation compared to 60 percent in the five-month period after the Operation began. About 43 percent of the total value stolen[53] was recovered in the prior year compared to 53 percent during the post-Operation period. From 1983, the recovery rate for stolen vehicles in El Paso was low compared to other cities (the recovery rate is about 60 percent for Texas cities, see Miller 1987), the difficulty of tracking culprits across the border being the perceived explanation for this low recovery rate. The FBI does recover some vehicles through its liaison with authorities in Mexico, but we are told that the recovered vehicles are often stripped and substantially reduced in value. The data indicate that both the recovery rate and the value of recovered vehicles increased during the post-Operation period, but, paradoxically, the average value of recovered vehicles has been declining steadily in recent years. That the number of vehicles recovered from outside the community has nearly doubled in a short period may be testimony to statewide and regional efforts to become more effective in dealing with motor vehicle theft.

As indicated above, some law enforcement officials hypothesize that the Border Patrol's new strategy reduces minor and unreported crime, the nuisance activities of at risk juveniles and young adults, by making it more difficult for young males to enter the United States from Juárez. They may be less likely to have the required documentation to get through the regulated entry points. To the extent that this type of flow has been reduced, the results should be reflected in minor criminal offenses.

Although residential burglaries are not minor crimes by any standard, we have added them to a list of such petty crimes as minor theft, purse snatching, and shoplifting presumed to be committed by younger offenders (**Table 35**, panel D). We assume greater expertise would be required to burglarize a commercial establishment, where the returns may be greater but so are the risks of detection from security systems.

The incidence of residential burglaries and purse-snatching/pick pocketing complaints is dramatically lower in the post-Operation period compared to the same months one year earlier, as is the total value of losses and the average property loss per incident (**Table 35**, panel D). Both minor larceny-theft, where the stolen property is valued less than $50, and shoplifting incidents did not vary much in terms of total number during the two five-month periods contrasted in **Table 35**, although the total value and the average value per incident both declined.[54]

The number of commercial burglaries were down even more than residential burglaries during the two periods (38.9 percent). Although commercial burglaries showed a similar drop in total value of property lost as in residential burglaries, the average loss per incident increased by 12 percent, to $1,164 per incident on average, surprisingly similar to the residential burglary average ($1,112). Major larcenies (property losses over $50) decreased by 19 percent but the value per incident increased 37 percent (the total value increased by 12 percent).

In the absence of any information on earlier trends, the data are consistent with the hypothesis that both major and minor property crime declined somewhat during the post-Operation period relative to the situation one year earlier. Whether the decline is due to the Border Patrol's success in curtailing the entry of the at risk population or to the efforts of law enforcement agencies is speculative from this data alone. The total decline in such incidents is exclusively due to the change in the number of burglaries and motor vehicle thefts, both of which have received particular attention from local law enforcement agencies in recent years, and with some effect in recent years prior to the Operation.

[53] $35.4 million, up from $10.6 million in 1986 according to Miller (1987).

[54] We are mystified why the average value per incident is greater than $50 ($66) from October 1992-February 1993 for incidents that are supposed to be valued at $50 or less and suspect either an accounting or a classification error may be at fault.

Other Measurements

Railroads. In addition to being served by major airlines and highways, El Paso is connected to other parts of the country by three major rail systems, the Santa Fe Railroad, the Southern Pacific Railroad, and the Union Pacific Railroad. While providing transportation for the shipment of goods both into and through the city, they unintentionally also provide transportation for migrants. If Operation Hold the Line successfully reduced the numbers of illegal migrants entering the country near El Paso, then it should have reduce the numbers of illegal migrants trespassing on railroad property. Data provided by the Santa Fe Railroad suggest such a reduction; the numbers of illegal migrants caught by the railroad's police department significantly declined since the Operation was implemented.

Apprehensions and arrests of illegal migrants across the entire Santa Fe Railroad system declined since Operation Hold the Line was implemented.[55] **Table 36** displays the number of illegal migrant adults apprehended systemwide by the Santa Fe Railroad from January 1, 1992, through May 26, 1994. The table shows that apprehensions increased for comparable months from 1992 to 1993. Since the operation's implementation, apprehensions of illegal migrant adults by Santa Fe Railroad police are down dramatically. Systemwide, between January 1 and May 27, 1994, Santa Fe Railroad police officers apprehended 1,407 illegal migrant adults, compared to 3,047 during the same period in 1993, a 53.8 percent decrease. Apprehensions of illegal migrant juveniles and arrests of illegal migrants by Santa Fe Railroad police declined by 38.2 percent (from 89 to 55) and 49.9 percent (from 2,612 to 1,309), respectively.

The available data do not provide the numbers of illegal migrants apprehended/arrested in El Paso

[55] An apprehended illegal migrant may or may not be arrested. The Santa Fe Railroad police record an arrest when the apprehending officer turns the alien(s) over to either the Border Patrol or local authorities. In areas where there is no Border Patrol or where local authorities refuse to take trespassers into custody (because of jail overcrowding due to more serious crimes), railroad police officers warn the illegal migrants and release them.

by month. Therefore, to compare the number of illegal migrants apprehended/arrested in El Paso during the post-Operation implementation period to analogous months in the pre-Operation period, one must extrapolate. In 1993, 47.9 percent (3,047 of 6,396) of the illegal migrant adults apprehended by the Santa Fe Railroad police were caught between January and May 1993. (For ease of discussion, the proportion of apprehensions/arrests in January-May to those for the full year is henceforth referred to as the JM ratio.) Assuming the JM ratio for 1993 holds true for 1994, one can project that approximately 1,191 illegal migrant adults will be apprehended in El Paso in 1994, a 76.0 percent decrease from 1993.[56] Thirty-four illegal migrant juveniles were apprehended during the January-May 1994 time. Assuming the 1993 JM ratio for illegal migrant juvenile apprehensions of 53.0 percent holds for 1994, one can project a total of 64 illegal migrant juvenile apprehensions in El Paso during 1994, a 57.8 percent decrease from the previous year. A similar projection based on the 1993 JM ratio for illegal migrant arrests in El Paso by Santa Fe Railroad police reveals a predicted 73.1 percent decrease in arrests in 1994 versus 1993.

These projections, however, are based on the assumption that the JM ratios for each group observed, i.e., illegal migrant adults, illegal migrant juveniles, and arrests, will remain constant for 1994. This assumption is questionable because of the dramatic decline in illegal migrant apprehensions/arrests during the final three months of 1993 as shown in **Table 36**. It is, therefore, not unreasonable to believe that Operation Hold the Line may have unduly influenced the JM ratios for 1993. However, using the JM ratios for 1992 and developing a mean JM ratio by averaging 1992 and 1993 data provides similar results. The JM ratio for illegal migrant adults for 1992 is 39.9 percent. Using that figure, one would predict that 1,422 illegal migrant adults would be apprehended by Santa Fe Railroad police officers in El Paso in 1994. That means a 71.4 percent reduction in apprehensions of illegal migrant adults during the first five months of 1994 versus the same time period in 1993. The mean 1992-1993 JM ratio is 43.8 percent, resulting in a predicted 1,293 apprehensions of illegal migrant adults, a 73.9 percent decline in apprehensions from 1993 to 1994. Similar conclusions result from applying the same approach to apprehensions of illegal migrant juveniles and arrests of illegal migrants by the Santa Fe Railroad police.

Clearly, the numbers of apprehensions and/or arrests of illegal migrants, both adults and juveniles have declined since the implementation of Operation Hold the Line. While it is unlikely that the decrease in apprehensions and arrests can be solely attributed to the Operation Hold the Line, it is not unreasonable to believe that the Operation is responsible for a substantial part of the decrease. Similar information was provided by the Southern Pacific Railroad police department. Although unwilling to provide specific crime statistics, they reported a 75 percent reduction in apprehensions of undocumented migrants. In October and November 1993, they experienced a total of five burglaries, compared to about five per day previously. The department attributes about 90 percent of the crimes on Southern Pacific property to undocumented migrants and attributes the majority of the reduction in criminal activity to Operation Hold the Line.

Drugs and Contraband. The U.S. Customs Service in El Paso is responsible for inspecting incoming people and vehicles to collect duties imposed on incoming goods and to prevent the importation of goods declared illegal by the U.S government. Among those items often smuggled across the border are illegal drugs. As Operation Hold the Line interrupted the flow of people across the border at other than legal ports of entry, one would have expected an increase in attempts to smuggle drugs and other items through the ports of entry. The Customs Service maintains records of people apprehended for attempting to import goods illegally, paying particular attention to drug smuggling. **Table 37** shows the numbers of people apprehended while attempting to smuggle drugs and other items through the El Paso ports of entry during the period September 1992 -March 1994. The mean number of

[56] 567 illegal migrant adults apprehended from January-May 1994 in El Paso divided by the 47.6% JM ratio results in a projection of 1,191 expected to be apprehended in El Paso during the entire 1994 year. 1,191 projected apprehensions for 1994 is a 76.0 percent decrease from the 4,964 actual apprehensions in El Paso in 1993.

monthly apprehensions decreased slightly after the operation was implemented, but apprehensions for smuggling of marijuana, cocaine, and heroine increased by 14.8 percent, 8.7 percent, and 105.7 percent, respectively. **Table 38** shows the amounts by weight of marijuana, cocaine and heroine seized during those apprehensions. Marijuana seizures increased by 69.4 percent and heroine seizures increased by 61.9 percent, while cocaine seizures decreased by 28.3 percent. During the same time, total vehicle inspections increased by 3.9 percent. Because the rate of apprehensions for drug smuggling increased at a rate significantly higher than the rate of vehicle inspections, it is not unreasonable to suggest that Operation Hold the Line had an impact on drug smugglers. Deterred from crossing the border where the line of Border Patrol are stationed, it appears that smugglers increased attempts to cross at the ports of entries, resulting in increased apprehensions and seizures.

Agriculture. It also appears that Operation Hold the Line had a significant impact on the illegal importation of various agricultural goods through the El Paso area. Since the operation began, there was a substantial decrease in the number of persons apprehended by agents of the El Paso district of the U.S. Department of Agriculture in possession of contraband agricultural goods while attempting to cross the border illegally. The department maintains data on the quantities seized of various fruits (specifically limes, avocados, guavas, and mangos), plants, exotic birds, and other items. **Table 39** shows the number of persons apprehended carrying contraband agricultural products into the El Paso area by USDA agents during fiscal years 1984 through 1993. It also lists the quantities of fruits and the numbers of exotic birds seized during that period.

The dramatic changes in apprehensions and confiscations appear to be directly related to the number of agents patrolling the border area. The USDA assigns agents to the district primarily to inspect people and vehicles entering the country through legal ports of entry. Prior to 1986, USDA agents had patrolled illegal border crossing points sporadically, on a volunteer basis. In 1986, the district increased the number of agents patrolling the border away from legal ports of entry. Then in 1989, the district teamed its agents with Border Patrol agents, effec-

tively doubling the number of patrols searching for illegal border crossers importing undeclared agricultural products. In 1992, the USDA reduced the number of its agents patrolling the border as increasing activity at legal ports of entry restricted the availability of agents for patrol duties. The numbers of persons apprehended and contraband goods confiscated shown in **Table 39** correspondingly reflect the increase and subsequent decrease in USDA agents patrolling the border. However, the number of apprehensions and contraband goods seizures plummeted in fiscal year 1994, when Operation Hold the Line was implemented. The number of persons carrying contraband agricultural products apprehended in the El Paso area by USDA agents during the fiscal year 1993 was higher than the first six months of fiscal year 1994, suggesting that the Border Patrol's operation had a significant impact on illegal importation of contraband agricultural products in the El Paso area.

Effects on *Pasamojados* in Juárez**.** We interviewed one smuggler of undocumented international migrants—we refer to him as Miguel—next to the Rio Grande on a busy street in downtown Juárez on the afternoon of February 9, 1994. Prior to the initiation of the Operation in September 1993, this *pasamojados* ("crosser of wetbacks") had worked as a *lanchero*, ferrying Mexican nationals in his launch across the river to the shore in El Paso daily. The Border Patrol's new enforcement strategy had forced him to discontinue his boat service and adopt new strategies for crossing people illegally into the United States. Miguel told us that as a *lanchero*, he used to ferry three hundred persons daily across the Rio Grande in his boat, principally between 6 and 11 A.M. He charged his customers between U.S. $1-5, depending on his perception of their ability to pay—better dressed people who appeared to be better off economically generally paid more. Miguel said that he used to ferry "all kinds of different people" who were heading north for "all kinds of different reasons," but the bulk of his clientele consisted of Juárez residents who worked in El Paso. He also explained that, generally speaking, he did not ferry people from El Paso back to Juárez: those who waded or boated north across the river illegally typically walked or hitched a ride back across one of the bridges heading south.

Since the implementation of Operation Hold the Line, Miguel continued to work as a *pasamojados*, but his clients and his means for crossing them changed. Where before he ferried up to three hundred persons a day, mainly Juarenses who worked in El Paso, he now guides around thirty persons per week, mainly individuals migrating long distances from the interior of Mexico to interior points in the United States. Instead of ferrying them across the river in downtown Juárez by boat in daylight, he takes them by cover of night over or around Monte Cristo Rey near the western terminus of the Border Patrol's line of agents where the Juárez *colonia* of Anapra abuts Sunland Park, New Mexico. At this point, the border is just a line on a map, not a river to cross. The rate he charges now depends upon the extent of the service offered:

- U.S. $50 to be taken to Sunland Park, NM (clients either make their own arrangements to be picked up on the U.S. side or can take a Sun Metro bus into El Paso);

- U.S. $100 to be crossed at Sunland Park and taken by car or truck to downtown El Paso;

- U.S. $300 to make flight arrangements to an interior U.S. city and be taken to the El Paso airport.

Frequent destinations for current customers are Denver, Los Angeles, Dallas, and Chicago. Miguel claims that other *pasamojados* charge lower rates but don't provide as reliable a service. He claims an 85 percent success rate in getting people across via Sunland Park.

Interviews with other *pasamojados* indicate that even if a wall were built at Sunland Park-Anapra, other areas exist where crossers could get around the walled-off area (currently, for example, in the area around Zaragoza). Where before these *pasamojados* took daily commuters across the river to shop and work, their clients now are persons who intend to remain in the United States. The *pasamojados* report that they continue to earn $200-$300 a day working three or four hours at a time; some days they make as much as $500 or even $700. Where before they

charged between $1 and $3 per client, now they charge up to $100 to deliver an undocumented client to downtown El Paso.

Conclusions

What can we conclude from the above analyses? Our expectations on crime data were shaped by the information we received from interviews with law enforcement and city officials in February 1994. From six hypotheses based on that information, our conclusions follow the restatement of each hypothesis:

1. The El Paso crime rate, particularly with respect to property crime, is high due to its proximity to a large and relatively poor Mexican city.

   No crime rate is acceptably low, but the evidence is clear that El Paso does not have a high crime rate relative to other U.S. cities of comparable size. There is no statistical evidence that demonstrates that the crime rate in El Paso, or other border cities for that matter, is high because of proximity to the Mexican border. There is evidence that suggests the Hispanic population is a relatively low-risk population for committing violent crimes when other factors are held constant, but relatively high-risk for committing property crimes.

2. The crime rate has been increasing in recent years, in part because of the increasing population pressures that El Paso shares with Juárez and in part because of the predatory behavior of some illegal entrants to the United States. To the extent the flow of illegals has been uncontrolled, the opportunities for a small, predatory subclass to engage in criminal activity in El Paso has increased.

   There is no doubt that the crime rate increased sharply for most serious offenses during the 1980s, particularly for motor vehicle theft, and that the total rate for El Paso grew faster than other cities of comparable size from 1982 to 1992. But the rates for property crime, especially burglary and larceny-theft, have been declining in recent years. It is possible that undocumented aliens contributed disproportionately to the rapid increase in crime in El Paso in the 1980s, but law enforcement manpower in the city was about one-half the national average during that time, and this must have been a contributing factor to the deteriorating situation as well. We have no direct evidence on the contribution of the illegal flow to crime rates in El Paso.

3. Young, male, poor residents of Juárez constitute a high-risk population for some types of criminal activity, mostly in regard to gang activity, minor offenses, and property crime.

   The evidence here is mixed. We have no information on gang activity, but according to data on arrests, the reduction in minor offenses in the post-Operation period appeared more due to the role played by adult (possibly young adult) Hispanics rather than juveniles. Juveniles, particularly Hispanics, contributed disproportionately more to the reduction in serious crime than did adult offenders, and they certainly were more evident in arrests for vandalism. The expected decrease in petty crime does seem to be supported by the evidence, but the mechanisms that account for the decline are not as clear as our informants had predicted.

4. To the extent it curtails the illegal entry of the population at risk, the Border Patrol's strategy should have an immediate impact on property offenses and minor crime that should continue over the long term.

   We do not have a long term to inspect as yet, but the immediate effects, if they are real, seem to include violent offenses, especially aggravated assault, and motor vehicle theft. It is clear that the cost of crime for the criminal has gone up as reflected in the clearance rates, and the returns have gone down for all levels of property crime.

5. The largest immediate effect of the Border Patrol's effort will be felt in the downtown areas of El Paso (police districts 31-36 and 51-56).

This seems unequivocally supported by the available data and by local police impressions of the changing character of the downtown area. We do not have access to post-Operation arrests linked to surrounding geographical areas that would provide a definitive commentary on the changing distribution of crime in the region.

6. The Operation's initial effects on serious crime may be short-lived as chronic offenders adapt to the new conditions. The Operation may have a long-term effect on violent and more serious crime if it is sustained and if law enforcement agencies are able to redirect resources into those areas as a result of sustained curtailment of the more numerous petty offenses that plague the community.

   Serious crime does appear to have declined since the Operation began. However, not enough time has elapsed to be able to tell if the reductions in serious crime are due mostly to the Operation curtailing illegals who commit crimes or to the redeployment of El Paso police so that serious crimes among noncrossers are being deterred. Downward trends predate the onset of the Operation, and earlier years have experienced similarly comprehensive and sharp downturns in crime rates (1990-1991 in particular). The trends may have as much to do with local law enforcement and other factors in the community that may have gone unnoticed until the Border Patrol's Operation drew attention to such issues. Nevertheless, the patterns are consistent with the possibility that Operation Hold the Line has directly reduced crime, but it is yet unclear that the effects are large enough to be significant. There is no doubt that minor offenders of all ages and some petty nuisance crimes committed by juveniles in the downtown have waned and quite probably as a direct result of the current strategy to police the border. There is also no doubt that law enforcement resources have been redirected to other kinds of crime in the community. This may account for some of the drop in serious crime.

   In regard to conclusions based on our examination of data from the railroads, the U.S. Customs service, the U.S. Department of Agriculture, and our interviews with *pasamojados*, we found that railyard arrests and drug and contraband seizures declined since the Operation began. Mexican smugglers ferrying persons across the river continue to operate, but at a reduced rate of activity, and they are now charging higher prices than before the Operation began.

VII. Community & Organizational Effects in El Paso

This chapter examines the effects of the Operation on community and organization-related variables. We assess three aspects of the Operation's impact on the community—its effects on public opinion, its perception by Mexican-American community leaders, and its effects on human rights. We also interviewed Border Patrol agents to determine their perceptions of the Operation's impact on the organization and on their own job situations.

Public Opinion

The general impression one gets from talking to people in El Paso is that there is overwhelming popular support for Operation Hold the Line and for continuing it indefinitely. Media reports indicate that while some may have had reservations about the manner in which the Operation was implemented, the overall reception to it has been positive and the vast majority of El Pasoans are pleased with the Border Patrol's initiative. In the Chihuahuita neighborhood, residents even painted a mural thanking the Border Patrol for their action and praising Silvestre Reyes. El Paso's Channel 4 television news program regularly conducts call-in polls on topics of public interest; during the first week of the Operation received about 2,500 calls, nearly double the normal response. About 95 percent of the respondents indicated support for the Operation. An exit poll at a primary election site and one other political poll indicated support ranging from 84 to 95 percent

as well, and a survey conducted by the Border Rights Coalition in conjunction with the Mexican-American Legal Defense and Education Fund found a nearly 70 percent favorable response in the Chihuahuita neighborhood. Results from research team interviews confirm these findings and indicate a significant amount of popular support for the Operation.

While the figures appear to suggest overwhelming support within the community, there has been no scientific survey based on an unbiased representative sampling of the population. Telephone call-in polls do not ensure a random sample. The political polls asked only two questions in a larger survey of a broad array of topics. One poll was conducted for a Republican and one for a Democrat. The former involved 125 respondents selected at random from a list of people who had voted in the four previous Republican party primary elections and were, therefore, considered likely to vote in the primary election for which the poll was taken. The second poll was an exit survey of 115 people who had voted on the day of the survey during the early voting period for the Democratic primary. Both of these surveys, as with the Chihuahuita survey, sought information from a selected group of individuals and, consequently, cannot be taken as representative of the entire El Paso population.

The research budget was insufficient to conduct a scientific public opinion poll among El Paso and Juárez residents. In El Paso, survey costs are elevated by the large size of the Mexican-ancestry community, which would necessitate additional sample stratification. The Mexican-ancestry population of El Paso is quite diverse in terms of citizenship and residency status, Spanish-English language ability and practices, and degree of cultural, social, and kin-based linkedness to Mexico (Martinez 1994; Vila 1994). To get a comprehensive picture of public attitudes towards the Operation, it would be necessary to take special account of this diversity not only in terms of sample stratification, but also in terms of the language used in the questionnaires, the language fluency of interviewers in both Spanish and English, and the ethnicity of interviewers as well (Marin & Marin 1991).

Although it was not possible to conduct an unbiased, scientific survey in El Paso or Juárez, we were able to uncover many themes present in the public discourse on the Operation through in-depth interviews of key informants in both cities. In particular, we present below the results of meetings with leaders of El Paso's Mexican-American community. Mexican-American subsections of the community may support the Operation in different ways and for different reasons. Undoubtedly, there are those who support the Operation because they no long identify strongly with Mexico. Still others might favor the Operation because they strongly identify with the United States, believe that by doing so they will be accepted as Americans, or feel that doing so will prevent their being denounced as un-American. Whatever the case, a scientific survey of an appropriately sized, random sample of the entire population of El Paso and Juárez would generate results that would show which sectors of the population support the Operation and which do not.

Mexican-American Community[57]

This section describes the attitudes of Mexican-American elites in El Paso regarding Operation Hold the Line based on information gathered in ten personal interviews and in a group discussion involving fourteen participants conducted about seven months after the Operation began. The respondents included the county judge, two city councilmen, senior level public employees, directors of community-based organizations and social service agencies, and representatives of a wide range of civic and business associations.

The interviews focused on the positive and negative aspects of Operation Hold the Line. The following themes developed in the course of that conversation:

- The objectives of the policy;
- The legality of the policy;

[57] By Mexican American community, we refer to those persons of Mexican ancestry residing in El Paso who were born and/or raised in the United States.

- Who wanted the policy;
- The effects of the policy;
- Support and opposition among Mexican-Americans; and
- Ethnicity as a factor affecting Mexican-American responses.

The Objectives of the Policy. As is described more fully below, no precipitating events in El Paso were seen as having caused Operation Hold the Line. Respondents were, therefore, uncertain about the policy's objectives. The predominant view was that the policy was aimed primarily at reducing crime and social service abuse by undocumented immigrants. This was the justification offered by Mr. Silvestre Reyes of the Border Patrol, according to numerous respondents. A second view shared by a smaller, but substantial, number of respondents was that the policy was a means for the Border Patrol to defend its institutional interests. None of the respondents identified control of illegal immigration *per se* as an objective of Operation Hold the Line.

The Legality of the Policy. The respondents noted and emphasized that the United States has the right to police its border and control entry into the national territory. That Mexican-American leaders did not challenge Operation Hold the Line's legitimacy might seem somewhat surprising to some observers. One reason mentioned for this response was that the Mexican government publicly declared that the U. S. government had the right to implement Operation Hold the Line. This official Mexican position had four significant consequences. First, it helped defuse public anger in Juárez. As protests there were fueling similar sentiments in El Paso, dampening the public's ire in Juárez helped quiet voices across the river. Second, just as Mexican-Americans were mobilizing to demonstrate against Operation Hold the Line, the Mexican government publicly declared that it was not going to protest in behalf of its citizens, thus making it problematic for Mexican-Americans to do so. Third, Mexico's official position made it politically easier for those Mexican-Americans who supported the policy to make their views public. There has long been a sizable number of El Paso's Mexican American leaders that recognize and value the many strong ties that link the two cities and that do not want to contradict official Mexican policy. Once Mexico made its position public, these Mexican-Americans, who included elected officials and directors of community-based organizations, did not feel constrained to hide their support for the Operation.

Moreover, because it explicitly targeted Mexicans as they illegally entered the United States rather than pursuing them once they mixed with Mexican-Americans within the U.S., Operation Hold the Line reduced harassment of Mexican-Americans and violations of the civil rights of Mexican-Americans or legal Mexican immigrants. Operation Hold the Line, thus, gave rise to no legal protests on account of such actions. The absence of legal challenges profoundly affected Mexican-American responses to Operation Hold the Line. It eliminated organized protests. More significantly, it made it possible for Mexican American leaders to participate in serious conversations regarding the El Paso/Juárez relationship.

Why the Policy was Initiated. The respondents unanimously agreed that prior to the initiation of Operation Hold the Line nothing unusual was happening in El Paso to prompt the new policy. Whatever their reactions to Operation Hold the Line, once it was implemented, El Paso residents in general, and Mexican-Americans in particular, were not asking that such a policy be developed. To the contrary, border control and immigration reform were not significant issues for most of El Paso's Mexican-Americans. In this, El Paso's Mexican-Americans reflect a well-established pattern. When asked to identify the issues that most concern them, Mexican-American leaders seldom mention immigration or immigration-related issues (de la Garza 1982; Pachon & DeSipio 1990). Similarly, the Latino National Political survey found that virtually no Mexican-American identified immigration as the most important problem facing their community or the nation (de la Garza 1992).

Given that Operation Hold the Line was not spurred by any new developments in El Paso, the respondents were troubled that El Paso was chosen as the

site for implementing this new policy with no apparent regard for how it would affect El Paso/Juárez. Moreover, there was widespread agreement that a major factor motivating Operation Hold the Line was the need for the Border Patrol to improve its image in the wake of national concern regarding undocumented immigration. Several respondents referred to proposals to militarize the border as indications that the Border Patrol was under siege and needed to act to protect its turf.

At no time did any respondent refer to illegal immigration as a national problem. Respondents acknowledged the debate regarding undocumented immigration, but seemed oblivious to claims that illegal immigrants were a drain on the nation.

Evaluation of Operation Hold the Line's Effects. Virtually all respondents agreed that Operation Hold the Line has:

- Reduced petty crime;
- Greatly diminished Border Patrol and police harassment of Mexican-Americans and legal Mexican resident aliens;
- Negatively affected businesses along the border;
- Increased tensions between El Paso and Juárez;
- Had, with one exception, no-long term effect on the prior patterns of interactions between El Paso/Juárez, including illegal crossings for the purpose of employment (it was reported that crossers in this category have changed their routine, i.e., maids and gardeners now stay in El Paso for longer periods rather than cross on a daily basis); and
- The one pre-Operation pattern that was disrupted is daily illegal crossings that appear to have been responsible for petty crime and made up the "street people" in El Paso's downtown area.

Support and Opposition among Mexican-American leaders. Respondents were divided in their reaction to Operation Hold the Line. Overall, their response is best characterized as a combination of general opposition, acquiescence, and targeted support. A clear majority expressed reservations about Operation Hold the Line, and between one-quarter and one-third supported it. This split reverses the pattern that appears to characterize how Mexican-Americans in general view Operation Hold the Line. However, as noted above, Mexican-American leaders opposed to Operation Hold the Line said they have had little political space within which to voice their opposition. That silence combined with public expressions of support may give an exaggerated impression of the extent to which Mexican-American leaders support Operation Hold the Line.

Respondents with reservations about Operation Hold the Line dismissed its achievements on several grounds. First, they argued that the amount and type of crime and nuisance caused by illegal crossers did not warrant such a heavy-handed response. Moreover, they claimed that street people continue to populate downtown El Paso, but that now, however, they are Anglo panhandlers. Several respondents asked why the latter are tolerated when their Mexican counterparts, who tended to be street vendors or windshield washers rather than panhandlers, are not? Second, they argued that because the Border Patrol and police have no right to harass Mexican-Americans, it makes no sense to defend Operation Hold the Line because it reduces such abuse. Third, they questioned how the cost of Operation Hold the Line could be justified if all it does is reduce petty crime? Fourth, they thought Operation Hold the Line contradicts the spirit of NAFTA and that its achievements do not compensate for the resentment it causes among Mexicans in Juárez and the disruptions it effected in the historical relationship of the El Paso/Juárez communities.

Operation Hold the Line opponents were made up primarily of leaders of community-based organizations and advocacy groups. Most of them were reluctant to acknowledge the extent to which Mexican-Americans in general support Operation Hold the Line. This is best exemplified by the author of the survey that found over 70 percent support in Chihuahuita, a poor neighborhood along the border

that includes many small privately owned residences, who argued that those he interviewed were not opposed to immigrants and did not really understand the broader implications of Operation Hold the Line. He and others who denied widespread Mexican-American support of Operation Hold the Line were chastised by the head of a neighborhood clinic (who adamantly opposes Operation Hold the Line) for being out of touch with and projecting their views onto poor Mexican-American residents who live along the border. The head of a community-based religious organization also pointed out that many in his organization supported Operation Hold the Line.

Operation Hold the Line supporters consisted primarily of elected officials and representatives of business organizations. The former insisted that the great majority of Mexican-Americans support Operation Hold the Line because it has reduced petty crime and removed street vendors and others from parks and the downtown area. One city councilman noted that his constituents were calling him and stopping him on the street to tell him how pleased they were that they were once again able to leave their homes, walk the streets and go shopping. Another reported that his constituents strongly supported Operation Hold the Line because "no one jumped through my yard last night," and "my water hose has been in my yard for a week." A third elected official noted that residents in neighborhoods along the border often complained about burglaries perpetrated by illegal crossers. Thus, they were hanging out banners supporting Operation Hold the Line.

Several respondents suggested that the extent to which Mexican-Americans were concerned about the crime issue had been affected by how the press had covered the issue. For example, one respondent noted that her grandmother commented on how she felt relieved now that illegal crossers were no longer present in her neighborhood. The respondent reminded her grandmother that she had for years hired illegal crossers to do yard work and had never before expressed concern about theft or other problems. The grandmother agreed, but then explained her reaction by noting that the press had made it clear that crime had gone down since the Operation began.

Business leaders explained their support on legalistic grounds. Like everyone else, they were surprised when Operation Hold the Line was initiated. As it became clear that there was no legal basis for challenging the policy, that the policy would respect human rights, and that it would target illegal crossings and reduce the presence of the Border Patrol in Mexican-American neighborhoods, they came out in favor of it. Additionally, political and business leaders said that supporting the policy helped the Mexican-American image. First, it proved that Mexican-Americans are patriotic and support the nation's laws. Second, to the extent that crime and other problems in El Paso continued, it would show that Mexicans were not the cause of those difficulties.

Operation Hold the Line supporters and opponents voiced few general concerns about illegal immigration. Indeed, they favored liberalizing cross-border movements. Several proposed redefining the border so that movement between El Paso/Juárez would be unrestricted and would be controlled only at some distance beyond the border. Again, this is a view common to Mexican-American leaders (de la Garza 1982). Others advocated making it easier for Juárez residents to get the necessary documents for crossing the border. Most also noted that their only concern was with the 1 percent of the undocumented migrants who participated in illegal activities. Other illegal crossers came to shop or work and thus contributed to El Paso. "Why," asked the respondents, "should we prevent those activities?"

Respondents made no reference to the abuse of social services by undocumented crossers. To the contrary, one leader claimed that data showed that there was no decline in births following Operation Hold the Line, as presumably there would have been if large numbers of illegal crossers were using these services [see Chapter V for a statistical analysis of birth data that show a decline]. Several other respondents noted that legal crossers make use of these services but no one seems to know or protest that.

The division between supporters and opponents reflects a pattern common to Mexican-American views of immigration. As has been noted, immigration issues are not salient to Mexican-American leaders. Moreover, Mexican-American opposition to immigration is inversely correlated with education and income (de la Garza 1993). This pattern holds in El Paso. The respondents who oppose Operation Hold the Line live or work outside the areas most affected by petty crime. They are well-educated professionals. Those who support Operation Hold the Line do so in behalf of the victimized who are poorer and live in the affected areas.

Ethnicity as a Factor Affecting Mexican-American Responses. Ethnicity sometimes affected the responses of the Mexican-American leaders to Operation Hold the Line.

- Whether they supported or opposed Operation Hold the Line, several respondents thought the Mexican-American reaction might have been more negative but for the fact that the person who initiated it, Silvestre Reyes, was also a member of the Mexican-American leadership community and a source of pride for Mexican-Americans. Thus, when he announced the policy, some of the Mexican-American leaders argued that it was thus hard for them to protest.

  Some of them even argued that had an Anglo initiated Operation Hold the Line, there might have been more protest of the policy. This is because, as one Operation Hold the Line supporter said, "We have been attacked so many times that we are always defensive. The Operation would have disappeared in two or three days [if a Mexican-American had not directed it]. We would have been up in arms." Reyes' presence, in other words, was thought to have had two effects. First, it was argued that it deterred Mexican-Americans from mobilizing against Operation Hold the Line on the grounds that it was racist. Second, and as a result, the leaders argued that Reyes and Operation Hold the Line supporters had enough time to influence how the policy would be evaluated. They also said this initial period was further extended by Mexico's announced lack of protest of the legality of the policy. With that, the leaders said there was nothing left around which to mobilize protests, and the policy thus had a real chance to make itself felt.

- According to the respondents, Operation Hold the Line initially created a hostile anti-Mexican mood in El Paso. Spurred by Anglo support and press coverage, the leaders said some Mexican-American opponents of Operation Hold the Line were criticized as un-American by Anglos and Mexican-Americans alike. They said this served to prevent other potential Mexican-American critics from mobilizing or speaking out.

In conclusion, it would appear that Mexican-American leaders in El Paso are ambivalent regarding Operation Hold the Line. One reason they said they did not publicly oppose it was because there was little political space within which they could do so. They also said they were deterred from attacking the policy because a Mexican-American designed and was implementing it. Moreover, they also indicated they did not protest because Mexican officials recognized the right of the United States to enact it, and because it did not result in abuses of Mexican-American civil rights.

A sizable minority supported it because of its legality. Since it was legal, it would be unpatriotic to oppose it. Mexican-American elected officials supported it because their constituents benefited from it. That is, illegal crossers were disrupting neighborhoods and their presence was provoking Border Patrol and police harassment in El Paso's poor barrios. To the extent that the objectives of Operation Hold the Line are limited to reducing petty crime, the respondents we interviewed supported it. Beyond that, however, they did not. Virtually all respondents favored a much more open border policy.

Finally, the responses to Operation Hold the Line suggest the extent to which Mexican-American reactions to immigration policy reflect their concern about how such policy directly affects them. Initially Mexican-Americans reacted defensively to Opera-

tion Hold the Line. Once they realized that they could not protest it on racist grounds and that Operation Hold the Line would neither target them nor round them up inadvertently, they were free to either support it or acquiesce to its implementation.

Human Rights

There is a long-standing and ongoing controversy regarding the violation of human and civil rights of both legally admitted and undocumented migrants and Mexican-American citizens along the U.S./Mexico border by Border Patrol agents and other INS personnel. Complaints about Border Patrol behavior appear to have escalated after passage of the 1986 Immigration Reform and Control Act as the number of agents increased and enforcement activities intensified. Questions about Border Patrol behavior have been raised in reports by human rights watchdog groups and journalists, lawsuits, protests from Mexican Consulates, and hearings conducted by Congress and the U.S. Civil Rights Commission.

Important allegations of human rights abuses were cited by various organizations, including Americas Watch (a branch of Human Rights Watch), the Immigration Law Enforcement Monitoring Project [ILEMP] of the American Friends Service Committee, the National Human Rights Commission of Mexico, and the U.S. Civil Rights Commission. A hard-hitting series in the *Los Angeles Times* (McDonnell & Rotella 1993) also documented serious abuses.

In addition to these reports, there have been individual complaints and lawsuits against agents and the Border Patrol as an institution, including accusations of verbal, psychological, physical, and sexual abuse, as well as of racial discrimination and failure to follow proper legal procedures. The Border Patrol and the INS more generally have been accused of having inadequate complaint and oversight procedures, of failing to discipline abusive officers, and of covering up instances of abuse. These have frequently resulted in substantial monetary awards to plaintiffs. One extraordinary case involved a class action suite brought against the El Paso Border Patrol by seven American citizens who claimed they were harassed by agents on or near the grounds of Bowie High School in El Paso [*Murillo v. Musegades* (EP-92-319-B), W.D. Tex. December 4, 1992]. The school is situated adjacent to the border and, according to the Border Patrol, illegal Mexican crossers frequently fled onto the school grounds in order to disappear into the crowds and avoid apprehension. U.S. District Judge Lucius D. Bunton enjoined the Border Patrol from detaining individuals simply because they "look Hispanic." The judge singled out the El Paso Border Patrol Chief, Dale Musegades for "doing nothing" to end abuses that were brought to his attention. Musegades admitted in court that he had not even read a previous court order forbidding dragnet sweeps in which agents illegally targeted Latino bar patrons. The judge concluded that the Border Patrol had used "excessive force" in engaging in illegal and abusive conduct against Latinos in the city. He said that "no justification existed for the force used against numerous plaintiffs and witnesses," and that "victims fear retaliation by the INS and by the El Paso Border Patrol in the form of deportation, criminal charges, or loss of legal immigration status for themselves or family members."

In 1991, the U.S. District Court ruled that two agents were negligent when, in the course of pursuing five Mexicans attempting an illegal crossing by boat into El Paso, they caused the boat to capsize. One man drowned in the incident, and the court awarded $210 thousand in civil damages.

In May 1991 an El Paso agent shot and killed a *lanchero* (a Rio Grande boatman who ferries illegal crossers across the river) and was cleared as acting in self-defense. Witnesses and the Mexican government protested that the agent was in no danger when he fired.

The Mexican Consuls in border cities have frequently protested agent actions, and the Mexican government, through its embassy in Washington, has filed numerous diplomatic notes accusing agents of criminal violations of the rights of Mexican nationals. In August, 1992, the American Friends Service Committee, the League of United Latin American Citizens, and various organizations and individuals from the U.S. and Mexico filed a petition against the U.S. government with the Inter-American Commission on Human Rights of the Organization of American

States. The petition alleged that the government had "engaged in gross violations of human rights of individuals along the U.S. border with Mexico through the unjustified deadly use of force and violence."

Hearings looking into abuses on the border have been conducted by the House Committee on Government Operations, Subcommittee on Government Information, Justice, and Agriculture in July, 1992 and by the Judiciary Committee's Subcommittee on International Law, Immigration, and Refugees in August, 1992. In addition, the U.S. Civil Rights Commission held hearings on border incidents in San Diego in March 1993. In response to these and other developments, legislation is pending to establish an Immigration Enforcement Review Commission (H.R. 2119, commonly known as the Becerra bill after its principal sponsor, Xavier Becerra, D-California). The bill would set up the first civilian review panel ever created to oversee a federal government enforcement agency.

In summary, the INS and the Border Patrol have been targets of charges of excessive and abusive behavior in their enforcement of the nation's immigration laws on the southwestern frontier. The El Paso sector has been the scene of a significant number of complaints. The former El Paso Border Patrol chief was the target of a class action suit which the government lost.

Chief Patrol Agent Reyes took over from Mr. Musegades upon the latter's retirement. According to his own testimony, Chief Reyes was deeply concerned about the number of complaints of misconduct being lodged against his agents and the effect this was having on the Border Patrol's morale and its image in the community. In an interview, Chief Reyes said that when he first arrived on the job the community generally thought that the Patrol was part of the illegal immigration problem, not its solution. He noted the numerous individual allegations against agents, the lawsuits, the Bowie High School verdict, and a restraining order against the agency.

According to Chief Reyes most of these complaints were unjustified and stemmed from a systematic flaw in Border Patrol strategy that he said guaranteed failure. The strategy in place when he arrived on the scene was basically to permit Mexicans to cross the border illegally into the United States more or less at will and then to concentrate on apprehending those who either tried to continue into the interior or came to the attention of the Border Patrol once inside El Paso proper. Apprehensions of illegal migrants already in the United States were the benchmark by which the agency and individual officers rated their success. Operations took on the aspect of a cat and mouse game in which agents patrolled the sector on the lookout for suspicious persons, stopped them for questioning, and often engaged in pursuits if they fled. Those being pursued frequently resisted and/or claimed that agents used unnecessary force, failed to follow proper procedure, or engaged in harassment of a physical, psychological, or sexual nature. Both agents and suspected illegals often sustained injuries. More than occasionally shots were fired. Moreover, persons questioned or pursued sometimes turned out to be permanent residents, U.S. citizens, or Mexican nationals legally in the United States.

It seems evident that Chief Reyes hoped to reduce complaints leveled against his agents by changing enforcement strategy. The Patrol's own Seventy-Five Day Evaluation of Hold the Line states, "The complaints by the local community of over aggressiveness by the agents, the lawsuits and the complaints heard by the Chief Patrol Agent called for an immediate solution" (Reyes 1994). Operations Blockade and Hold the Line would arguably have the effect of reducing the number of encounters between agents and suspected illegal aliens by shifting from an effort to discover, catch, and return those who managed to get into El Paso to preventing them from entering in the first place.

What have been the consequences of this change of strategy for the rate and seriousness of complaints against agents? Interviews with Border Patrol officials, human rights activists, and other interested observers, and the analysis of those data that are available suggest that complaints of abuses have fallen markedly since September 19, 1993. It seems reasonable to attribute this change to Operation Hold the Line insofar as (1) the Border Patrol is no longer

deploying many agents within the city to look for and pursue illegal migrants, and (2) encounters between agents and suspected migrants have subsequently declined. Fewer encounters mean fewer opportunities for abuse and claims of abuse. Qualitative evidence collected in interviews with law enforcement officials, Border Patrol employees, and community groups indicates that the numbers of incidents involving abuses or charges of abuses have dropped substantially since the launching of the Operation.

Official evidence of complaints is collected by several government agencies, including the FBI, the local police, and the Border Patrol itself. The FBI is responsible for investigating complaints that come to its attention and the INS forwards those deemed of sufficient weight to the Office of Inspector General in the Justice Department in Washington. Interviews with the El Paso office of the FBI indicate that no complaints have come to their attention since the Operation began. Figures from the Office of Inspector General in Washington have not been made available as of this writing.

The El Paso Border district of the Patrol has provided data on complaints lodged with it and forwarded to the local branch of the Office of Inspector General, called the Office of Internal Audit. Serious complaints that involve violation of civil rights or criminal activity on the part of the agents are processed by the Office of Internal Audit; the rest are returned to the Border Patrol for review. Their data, while difficult to interpret, show a substantial drop in the overall number of complaints and cases considered serious enough to merit processing by the Office of Internal Audit. From October 1, 1992, through September 19, 1993, that is, in the eleven and a half months before the launching of the Operation, there were 114 complaints, 91 of which were found to merit review by the Office of Internal Audit. From September 19, 1993, until February 8, 1994, approximately the first five months of the operation, there were 38 complaints, 25 of which were handled by the Office of Internal Audit. This means that between September 19, 1993, and February 8, 1994, complaints were made at the rate of approximately 7.6 per month. If that rate continued, there would be 91 complaints over the first year of the Operation, compared to 114 during the previous 11 1/2 months, a reduction of 21 percent. The ratio of serious to less serious complaints in the period between the onset of the operation and February 1, 1994, is about 2 to 1; in the previous year it was about 4 to 1.

Another source of information on the level of complaints of abuses was collected and provided by Suzan Kern, Coordinator of the Border Rights Coalition, an El Paso-based group that works in the area of the human rights of Mexican migrants and minority groups. The Coalition was established by the Immigration Law Enforcement Monitoring program [ILEMP] of the American Friends Service Committee, based in Houston. One of its principal purposes is to encourage individuals to report abuses of the Border Patrol. ILEMP has established a common complaint form and organized groups to collect complaints in each of the five sectors along the U.S.-Mexican border. These data are then fed into a central collection point in Houston. None of the complaints collected by Ms. Kern in El Paso in 1993-1994 have been inputted; instead she provided a summary of all the reports she had collected from 1988 through January 1994.

These data can be somewhat difficult to interpret quantitatively. A form is completed for each "incident." Incidents may involve one or more persons. The person(s) may relate a number of different sorts of abuses occurring during the same incident. Sometimes the incident reported is not a single event but several or many that have involved the individual. The result is that the number of abusive behaviors reported is many times larger than the numbers of abusive incidents reported.

A coding mechanism has been developed by ILEMP to categorize types of abuse, the broad categories being (1) psychological or verbal, (2) physical, (3) denial of due process, (4) illegal or inappropriate seizure of persons, (5) illegal or inappropriate searches, (6) seizure or destruction of property, and (7) local law enforcement/Border Patrol cooperation. Both the date of the incident and the date the report is filed are recorded, although sometimes information is incomplete. The individuals involved may or may not report the incident to the authorities.

The Border Rights Coalition makes no attempt to externally validate the statements given by their informants.

In sum, the data result from an humanitarian organization's attempts to encourage and systematize the filing of complaints against the Border Patrol. Collection of data is erratic and episodic. No claim could be made that the figures represent the actual level of abuse or citizen perception of abuse. Nevertheless, they may be analyzed to see if there is a discernible difference before and after the implementation of Operation Hold the Line. The Border Rights Coalition's data indicate that there has been a sharp decline in the number of complaints filed and in the number of abuses reported by complainants in the months after September 19 (**Tables 40** and **41**).

If one of the chief objectives of Operation Hold the Line was to relieve the Border Patrol of the pressure and embarrassment of frequent, highly visible controversies over agents' alleged abusive behavior, it seems undeniably to have been successful. However, this objective has been achieved through a change in tactics and does not, on present evidence, appear to reflect any more fundamental change in the culture, training, or behavior of Border Patrol agents.

Table 40.

HUMAN RIGHTS-RELATED INCIDENTS REPORTED, EL PASO SECTOR

	Incidents	Incidents/Month
January 1 - September 18, 1993	18	2.1
September 19 - May 30, 1994	5	0.58

A single incident may involve a variety of abuses.

Source: Suzan Kern, Coordinator, Border Rights Coalition, El Paso.

Table 41.

TYPES OF ABUSE

	1/01-9/18/94	1/19-5/31/94
Psychological or verbal	25	1
Physical	8	2
Due process	11	3
Illegal/Inappropriate seizure of persons	17	2
Illegal/Inappropriate searches	—	1
Seizure or destruction of property	7	1
Local law enforcement/ Border Patrol cooperation	1	—
Total	69	10
Abuses/Month	8.1	1.2

Abuses are more numerous than incidents because a single incident may involve a variety of abuses.

Job Satisfaction among Border Patrol Agents

One potentially significant and pivotal effect of Operation Hold the Line is its impact on Border Patrol agents. The research team observed agents on duty over extended periods and conducted in-depth interviews. This section summarizes the findings of these observations and interviews, most of which were conducted between March 17 and May 3. Twelve agents at various levels of authority and experience were interviewed at length over the course of several weeks. Additionally, four management-level personnel were interviewed. The agents were asked to comment not only on their own situations, but also on the concerns of their fellow agents as they perceived those concerns. We had an opportunity to ride with agents, observe the line at different points, witness tracking and apprehension of undocumented migrants, spend time at Paso del Norte detention center [PDN], talk with undocumented migrants, and interview agents. The interviews result from an effort to locate individuals who could somehow represent a variety of perspectives (among those interviewed were three female agents). However, the sample size (12 of approximately 450 agents) and the nature of the topic means that the views expressed might not be representative.

Agents readily discussed their views and situations, which may itself signify the important effects of Operation Hold the Line on the lives of the agents. Several interviews lasted as long six hours. Agents were asked to act both as respondents, commenting on how the Operation had influenced their personal lives, and as observers, reporting what effects other agents had discussed with them. Some agents were interviewed more than once, particularly in their role as observers. Our observations and interviews generated more than two hundred pages of notes. What follows is a first assessment of the most salient issues that surfaced about the internal effects of Operation Hold the Line on the Border Patrol and its agents.

There appear to be several problems facing the agents. A number expressed frustration with the new border control strategy and a belief that the Operation is costly in terms of boredom, the erosion of job skills, low morale, and the resultant physical and psychological effects of stress. First among these is boredom. Instead of pursuing illegal migrants (a task they said required skill), agents are sitting alone on station for long hours watching for crossers with no action. One agent indicated that the six hours spent during the interview had been the high point of his job since the Operation started. He felt that the Operation had been harmful to his professional and personal life and stated that he was "dying of boredom."

A second problem, erosion of skills, is an important concern of the agents. Under the previous strategy, agents thought they encountered opportunities to improve their powers of observation and enhance their investigative and interrogative abilities through the diversity of activities they faced every day. In addition to pursuing and apprehending Mexicans observed crossing the border, they also investigated locations and businesses where undocumented aliens were suspected of being illegally employed, cultivated informants and followed up on informant's tips, and gathered information by talking to people in the streets. Under the current strategy, the majority of agents are assigned to the line for most of their duty time. The following is a typical reaction:

> You're sitting there and you are holding the line . . . that's all we're doing. We're not doing paperwork, we're not speaking Spanish, we're not cultivating our interviewing and investigative skills. Everything is dying.
>
> [What we need is] the opportunity to develop our skills, to get better at them gives us self-satisfaction. We want to excel in our job. We do not want to stay put, we do not want to sit and do nothing. We need the challenge of our investigative skills. We need the challenge of our physical skills.

The third problem is a loss of self-esteem and feelings of self-worth and the concomitant concern that those higher in the chain of command will be unable to identify and reward high achievers. Since

agents spend much of their time sitting and watching, they perceive little opportunity to excel; consequently, it would appear that their chances for promotion or beneficial transfers are substantially diminished. One agent who was adamant about this stated: "I feel that my career has ended." Others were equally adamant:

> Because we're just sitting on the line and we're not being productive, no paperwork, no cases, our appraisals have no chance of getting an outstanding rating. Everybody is going to get a satisfactory, in which you don't get an extra point.

> If we're just sitting on the levee doing nothing but crossword puzzles or reading, no cases, how can we justify that we should be upgraded to a GS11? We're afraid that they will come out here and audit us and say, "GS9, making $45,000 a year, are you kidding. You guys should be GS3s." Any GS3 person could be doing this. We're not doing anything. So that's what we're afraid will happen. I don't think they'll ever take our grade away, but it's a scary thought.

> It used to be that the Border Patrol allowed you to be involved in several different areas—freight trains, airports, a unit with plain clothes for picking up smugglers, foot patrol downtown with the PD officers, task force. The thing about it was that El Paso agents gained more experience/intelligence than a lot of other stations. It used to be that if you worked El Paso and you put in for something somewhere else, you probably got picked because they knew you had handled it all. But now, El Paso agents, now it's been seven months. At the end of one year, you get an appraisal. Now the supervisor will write one little sentence on there. "Satisfactory, sat on the levee."

Another important issue is job satisfaction, and a critical factor in job satisfaction was the freedom of action each agent was afforded. When asked what they most liked about their jobs, a frequent answer was the freedom that they had to operate:

> You were able to do your job the way you thought it should be done, not according to someone else's standards. If you were good at catching people coming across, if you had a way that worked best for you, that's how you worked it. No one told you how you had to catch the people, no one told you how to break someone if they said they were a U.S. citizen and you knew they weren't. You did it your way. You were challenging yourself everyday. It gave everybody a lot of freedom. In most jobs there is a quota, but we didn't have that. I can catch as many as I want; I can sit and wait for drugs to come across if I want; I can catch criminal acts if I want. That's a big freedom.

However, this kind job flexibility has also been a source of difficulty for the Border Patrol as an institution. Complaints and law suits were filed as a result of what others perceive as an arbitrary use of force. One of the most significant positive results of Operation Hold the Line is the dramatic reduction of abuse complaints against the Border Patrol. Some of the agents noted this:

> I think the number one benefit is the fact that we're not out there in the public and every other person turns around and files a civil rights or some sort of law suit on us. We're no longer out there for everybody to turn around and call the chief and say "he mistreated me." It's keeping us out of trouble.

Other agents expounded on their feelings of having been robbed of one of their primary sources of job satisfaction, the camaraderie:

> You miss working with the people because in the past you were one of the important components. When you were tracking, you worked closely with the people, working in a team, and [now] you don't get to do that. Especially in Anapra area, you have to work teamwork. If they took a little study [of] the agents who work for two weeks straight compared to those who work the line, you'll

> see a whole different personality. They're much happier. They joke around. They're ready for work. They want to go to work.

All of the factors mentioned above—boredom, erosion of skills, low morale and self-esteem, loss of job satisfaction—can lead to stress which, in turn, can generate further problems in a vicious cycle:

> I know that the guys I've talked to have said that their wives have told them that they're not the same person. [The wives say their husbands] never talk, never want to do anything anymore, have gained weight, or are constantly negative and in bad moods. Sitting in one place for nine hours a day with no one to talk to will do it to you. So as far as health effect, morale, spiritually, mentally, it's really, really taken it's toll.

> They've [management] obviously never thought about [the negative costs]. What can you do to alleviate back problems, headaches, migraines, stress? Some of these guys are just about ready to go off the deep end.

The frustration sensed during several interviews indicated classic signs of alienation—powerlessness, lack of sense of purpose, isolation, and detachment from work (Seeman 1959). Several agents were putting in for other jobs—about 40 percent according to one source. They said they were trying to leave the Border Patrol because they didn't feel they were accomplishing anything with their lives. One source said that in the past no one looked at the job vacancies book; now they all were looking at it just prior to heading out to the line.

The desire to quit is usually among the first responses towards an unfulfilling work environment (Mobly 1977; Steers & Mowday 1981). However, in the case of the Border Patrol, quitting is not an entirely viable alternative. Agents feel that they cannot quit because they earn a good salary. With overtime many can make between $35 thousand and $45 thousand after five to ten years on the job. Since many have no more than two years of college education, some believe that their opportunities for employment outside the federal government are limited. Nevertheless, there are those who have decided to make the best of what they consider to be a difficult situation. They are taking college classes, listening to language course tapes, or bringing hobby projects to the job with them. Only a minority of the agents interviewed acknowledged taking this approach, however.

Another finding is that agents do not detain every illegal migrant. Each of the agents seemed to have his or her own method for distinguishing between whom they considered to be the good guys and the bad guys:

> You weren't just worried about this one person standing there, especially if you knew that he's okay, just wanting to come in and pick up cans. We used to let people . . . pick up aluminum cans around UTEP or somewhere. That was the money they lived on. We knew that once they filled up their bag of aluminum cans, they'd go right back. That's not a problem. Rescue Mission people, same thing. They'd get their meals, they'd feed their kids, they'd go back. It's easy to turn your back on that so to speak, when you know you can go around the corner and pick up hundreds of illegals that are going to be standing on corners trying to wash your windows, or steal things, or sell cigarettes illegally.

Finally, it appears that a number of agents do not believe that Operation Hold the Line is successfully reducing the entry of undocumented aliens. One frustrated agent stated "they are coming around us, above us, below us, and between us," referring to the ends of the line, the railroad tracks which run above the ASARCO area, the tunnels by the downtown area, and the space between agents. During observation periods we witnessed several attempts to cross, some successful. Since agents are discouraged from leaving their designated spots, it is difficult to apprehend illegal migrants once they have crossed. One agent noted that management trumpets the success of the Operation based on reduced apprehensions data. He claimed that the reduction

in apprehensions was not because illegal crossings were being prevented, but rather because there were no agents available to apprehend illegal crossers once they had gotten beyond the line of agents at the border. He also asserted that the Border Patrol's employer sanctions unit was not apprehending suspects because it was not being allowed to open new cases.

Some agents noted that Operation Hold the Line does not prevent the entry of undocumented migrants; rather, it simply generates new crossing tactics. The most popular and successful technique is to use a decoy. According to one agent:

> They have one alien try to come across as a decoy. All the agents focus attention on him. But meanwhile, five will cross on the other area where they're not looking. So they know how to get in. There's an area way up here where there's no river, no fence. At nighttime, they just walk across.

The willingness to engage in this tactic can be explained in part by the low cost to the decoy who gets apprehended. Most of the time when an illegal migrant is apprehended, he/she is detained at PDN until twelve to fifteen individuals are being held. At that time Mexican authorities are notified. The Mexican authorities return the detainees to Mexico and release those who are Mexican citizens. Only those detainees who appear to be criminals are held at PDN for further investigation. Thus, the only real consequence to the average decoy who is caught is that he/she is detained and returned to Mexico for another attempt.

During one observation period researchers were able to see the decoy tactic in action. Agents were faced with a dilemma. If they ignored the decoy, that individual would succeed, knowing that once away from the line the chances of apprehension are seriously reduced. The tactic calls for decoys to be sent one at a time until the agents give chase. Then the rest cross unmolested. One agent expressed her frustration over the perception that once undocumented migrants have crossed they are essentially home free:

> They're not worried about walking outside their door or driving down the street, or working downtown, because they know there are no agents there. So most of these people have no worries about being in El Paso, once they're away from the border. I live on the west side, and I see maids over there, illegal maids, ten to twenty everyday in this one area. People ask, "How do you know they're illegal?" Because some of them I recognize from when I caught them.

Another popular tactic is to cross at night. According to one agent:

> [Night is] the easiest time. There are times at night where there is an area maybe every three or four hundred yards where we have a vehicle. But there are other areas that you have one vehicle and then for half a mile to a mile further, there is none. It's very easy for them to get into those areas, and they know which areas they can cross more easily. Nighttime, when it's dark, agents can't see everything. And he's not allowed to walk too far away from his vehicle, because we've had incidents where they've broken into the vehicle and stolen things, so he can't go too far away from the vehicle, so this allows the aliens to come through. Midnight shift is very easy. You've got agents now who have done this for seven months, and there are times when you just can't stay awake.

Although these statements and perceptions represent a small sampling of El Paso sector agents, a high percentage of the persons talked to expressed similar morale problems and similar concerns over the well-being of their fellow sector personnel. Without a more comprehensive survey, it is difficult to judge the full extent of the problem. However, these problems will require resolution if the enforcement strategy embodied in the Operation is to be replicated elsewhere along the border.

Conclusions

In summary, the Operation appears to have received widespread popular support, although no scientific representative poll has been taken to document the overall degree of this support or those population segments in which it is highest. Some ambivalence is evident among Mexican-American community leaders. While most support the Operation, several leaders of community organizations expressed opposition. A major positive effect of the Operation on the community is its substantial reduction of charges of human rights violations and abuses brought against the Border Patrol. Finally, the Operation may be creating morale problems among the Border Patrol rank-and-file, who report a high degree of boredom with the new duties involved in the Operation and express anxiety about what criteria will be used to assess their performance and determine promotion.

VIII. Effects on Illegal Border Crossers in El Paso and Juárez

Chapter III presented quantitative findings on the effects that the Operation had on illegal crossings from Mexico into the United States. In this chapter, we present our findings on the effects that Operation Hold the Line had on illegal crossers and their border-crossing behavior. These findings are based on dozens of qualitative, field interviews conducted in Juárez and El Paso in February, March, and April 1994. The first section describes the border-crossing situation prevailing in the months and years preceding the launching of Operation Blockade. The second section presents findings on some of the reasons why many Juárez residents have not been able to obtain INS permission to cross the border legally with a Border Crossing Card [BCC]. The last section describes illegal crossers' reports on how they have been affected by the Operation.

Before Operation Blockade

Many people we interviewed in Juárez and El Paso agreed that before the initiation of the blockade, illegal crossing of the border was fairly easy. While one reason given for this was that the border was not heavily patrolled, we also received reports that Border Patrol agents often informally allowed workers and other cross-border commuters who they believed were not engaged in criminal activities to cross freely without formal inspection at official ports of entry. This practice appears to have been particularly common at the point where Colonia Anapra, on the Mexican side, faces Sunland Park, New Mexico. Here the border is nothing more than a line in the sand separating two communities only several hundred yards apart from one another. Anapra is an outlying *colonia* in Juárez, and is a long bus ride over rough roads from downtown Juárez and the nearest international bridges. The Border Patrol kept this area under surveillance but, given the inconvenience of crossing at the official ports of entry, routinely allowed residents of both Anapra and Sunland Park to cross here. According to Border Patrol agents we interviewed, within the Patrol the Sunland Park, New Mexico zone was referred to as the "Anapra Port of Entry." One resident of Anapra, whose testimony matches that of other residents we interviewed, described the situation prevailing before the Operation:

> All kinds of people used this crossing, even if they had a Border Crossing Card. This is because we know that a Border Crossing Card is not valid for working. And if they have to be at work before nine in the morning, they can't cross on the bridge and still get to work on time. And the people having to work in the fields in New Mexico, well they have to be at work at four or five in the morning! So even with their border crossing cards it paid for them to cross here. . . . The immigration officials themselves made it easy if they knew that the people were crossing to work or if they recognized the person crossing. There were agents whose post seemed to be permanent, and they just about knew everyone who crossed here. I

> myself spent four years crossing here on foot. A lot of times we would go shopping in El Paso [Sunland Park is served by the El Paso bus system] or we would go to the San Martin de Porres church in Sunland Park, very close to here. The mounted *migra* would stop us over there to take some information from us, and when we would explain that we lived here, many times they would say, "Go ahead. Be careful and make sure you go back to where you live afterwards." Other times they would say, "Well, you can't cross here now. Go on back." Practically speaking, they never detained us. . . . And the street vendors knew the times of day when the agents would let them across, by pretending not to see them, after four o'clock in the afternoon and between six and eight in the morning.

Persons we interviewed in other parts of Juárez and El Paso confirmed these practices on the part of Border Patrol agents before the Operation began. And we were told of *lancheros* who ferried people across the river downtown in plain view of INS officials on the international bridges, who also apparently ignored illegal northbound crossings by people walking across on the wrong side of the bridge. (See, for example, the comments of Juárez city officials in Chapter II.)

The apparent tolerance of illegal crossing on the part of the Border Patrol led at times to anomalous results. The Rescue Mission, a church-run homeless shelter and soup kitchen located along the river near Old Fort Bliss, regularly received persons from Juárez seeking food and shelter. The Rio Grande at that point is shallow and easily forded, and many poor residents of Juárez would cross there to get a meal at the Mission. On occasion, the Border Patrol would enter the grounds of the Mission and arrest Mexicans who were on U.S. soil illegally. On Thanksgiving Day 1992, the Border Patrol staged a raid on the Rescue Mission and deported several undocumented Mexicans, mostly women and children.

The director of the Rescue Mission, a retired El Paso police officer, described his reaction to this incident. He said he could not understand why the Border Patrol would allow people to cross the river unimpeded and then arrest them when they sat down in his mission to say grace before their meal. Following the Thanksgiving incident, the Rescue Mission arranged a truce with the Border Patrol whereby the Mission agreed to check entrants' identification before serving them and the Border Patrol agreed to stage no further raids there. This agreement generated its own set of potential problems insofar as a homeless persons who appeared to be Mexican and could not prove U.S. residence could be turned away by the shelter—even though they could be U.S. citizens who, as homeless people, had lost their ID.

Not all illegal border crossers live in Juárez. Many undocumented Mexican residents live illegally in El Paso. Before the Operation, they were able to take advantage of the Border Patrol's tolerance of illegal crossing to visit friends and family on the Mexican side. In some cases, these illegal crossers living in El Paso were married to legal residents or citizens or had children who were U.S. citizens. We interviewed one Mexican man in El Paso whose case is illustrative. The man and his wife moved, illegally, from Delicias, Chihuahua to El Paso in 1979. They have resided in El Paso ever since, and have two children who are U.S. citizens attending the El Paso Public Schools. Both the man and his wife applied for amnesty in 1988. The man was granted amnesty, but his wife, because some of her papers were not properly filed by their immigration lawyer, was not. They have since applied for her to become a legal permanent resident, but her application is still pending. Traditionally, when this family wants to take the children to visit their grandparents in Delicias, they have driven together into Mexico in their station wagon. Upon returning to the border from Delicias, the man would drop his wife off near downtown Juárez to take a launch across the Rio Grande. He would drive across the international bridge with the children and pick her up on the north bank of the river. Since the Operation began, they have had to abandon this practice. This man says he knows that it is still possible to cross illegally, but that it is too risky for her to try anymore. "We're talking about the mother of my children, you know!"

In extensive interviews with both legal and illegal crossers from Juárez, we were told on several occasions that prior to Operation Hold the Line some persons who lived in Juárez and worked illegally in El Paso would cross the border illegally, away from official ports of entry, even though they possessed a valid BCC. The reason we were given for this apparently anomalous behavior was that these illegal workers feared having their BCCs confiscated by INS port of entry officers who might suspect them of working illegally.[58] The loss of the BCC could entail considerable hardship for its bearer, both in terms of loss of the privileges it confers and in terms of future prejudice should the person wish to apply for any other visa to the United States. Detention by the Border Patrol for illegal crossing, however, implied rather less drastic consequences for the detainee. Because the detainee need not present documents to the Border Patrol in order to be "voluntarily departed" back across the border, he/she could simply give a false name and be walked back across the bridge to Juárez after a few hours in detention, avoiding both loss of the BCC and future prejudice before the INS. Given that confiscation of the BCC seems to have been an unlikely event, we may surmise that BCC holders who routinely crossed the border illegally before Operation Hold the Line did so owing rather more to the fact that crossing illegally was fairly easy than to any substantial reduction in risk by pursuing such a strategy. Further, nearly all of the current or former illegal crossers we interviewed in Juárez and El Paso did not possess a BCC and had never applied for one. Below we discuss the reasons why illegal crossers did not avail themselves of the BCC in order to cross the border legally.

The Border Crossing Card

Operation Hold the Line was initiated by the Border Patrol of the Immigration and Naturalization Service to eliminate illegal northbound crossings of the U.S.-Mexican border in El Paso. Less concern seems to have been demonstrated with regard to preventing the illegal employment or settlement of Mexican nationals in El Paso once they have crossed the border. Most illegal northbound crossings in the El Paso district are made not by Mexican long-distance migrants whose destinations lie far into the U.S. interior, but rather by residents of Juárez who make social visits, shop, sell goods, and work in El Paso. These activities are often no different than those carried out by Juárez residents who cross the border legally with a Border Crossing Card. Moreover, many legal and illegal crossers are not meaningfully distinguishable in terms of their likelihood of becoming immigrants to the United States and of their potential membership in classes of excludable aliens under §1182 of the CFR (see above). Our best estimates indicate that there are many more Juárez residents who abuse their privileges as BCC holders by working in El Paso than there are Juárez-El Paso commuters who cross the border illegally. (See Chapter III for estimates of the relative sizes of these groups.) **Table 42** summarizes the differences and similarities among illegal border crossers, noncrossers, and BCC holders.

From a U.S. perspective, it would seem that almost any employed person in the workforce would quickly be able to meet the common sense requirements of the BCC application process regarding proof of one's residency and economic solvency.[59] The Mexican reality in general, and the Juárez reality in particular, however, do not correspond very well to a U.S. perspective on routine documentation of an individual's socioeconomic status. First, thousands of employed residents of Juárez, including the multitudes employed by U.S.-owned *maquiladora* plants, live in self-constructed housing in vast squatter settlements called *colonias*. Residents of these *colonias* often own no official title to their lots, pay no rent, and receive no public utilities. Water and propane gas are trucked in, and electricity is frequently pirated by attaching illicit feeder lines to main power lines. While *colonia* residents are poor by U.S. standards, they are typically quite attached to living in

[58] As we discuss in more detail below, INS officers have the right to confiscate BCCs they suspect are being used to work illegally in the U.S. A person crossing daily in the early morning hours would run a considerably higher risk of detection over time than someone crossing less frequently or at hours that corresponded better to other kinds of nonprohibited activities.

[59] See **Table 1** (Chapter II) for a listing of official INS requirement for BCC applicants.

Table 42.

COMPARISON OF CHARACTERISTICS OF ILLEGAL BORDER CROSSERS, NONCROSSERS, AND CROSSERS WHO POSSESS THE BORDER CROSSING CARD

	Illegal Crosser	Noncrosser, No BCC	BCC Holder
Length of Juárez residence	Likely to be a recent arrival.	Likely to be a recent arrival.	Likely to be long-term resident.
Informal vs. Formal employment	Likely to be unemployed or informally employed in Juárez; informally employed in El Paso.	May be either formally or informally employed, or unemployed in Juárez	Likely to have been formally employed in Juárez at the time of issuance of the BCC; may be formally or informally employed, or unemployed in Juárez at present; informally employed in El Paso.
Stable and sufficient source of income to support self and dependents	May or may not have a stable and sufficient source of income.	May or may not have a stable and sufficient source of income.	Has stable and sufficient source of income at the time the BCC is issued; may or may not subsequently.
Benefits derived from proximity to U.S.A.	Access to goods & services; lower prices for goods; may gain access to employment at higher wages.	Access to goods imported by smugglers and middlemen.	Access to goods & services; lower prices for goods; may gain access to employment at higher wages.
Frequency of border crossing	May cross frequently or infrequently, depending on motives for crossing and degree to which the border is effectively patrolled.	Does not cross.	May cross frequently or infrequently depending on motives for crossing; if employed in El Paso, frequency of crossing depends on work schedule and intensity of inspection of entrants by INS officers at U.S. ports of entry.
Family in El Paso	May have family members living in El Paso.	Seldom has family members living in El Paso.	May have family members living in El Paso.
Crossing status of other family members	May or may not have BCC.	May or may not have BCC.	May or may not have BCC.

Juárez, often having invested considerable portions of income and savings in the construction and maintenance of their homes.[60] Many residents own cars and have such modern appliances as stereos, VCRs, refrigerators, gas ranges, and televisions. The existence of such squatter settlements is less an indication of widespread absolute poverty in Juárez (as measured by personal incomes), and more an indication of the city's lack of an adequate infrastructure to meet the needs of a population growing rapidly due to migration from the Mexican interior. Many *colonia* residents might have a difficult time in documenting their Juárez residence in the ways requested of BCC applicants by the INS.

Second, a large proportion of the population all over Mexico, but especially in a Northern border city like Juárez, is employed in the so-called informal sector. By informal sector, we refer here not only to the petty commerce of street vendors and market stall operators, but also to a wide range of economic activities undertaken by small-scale establishments and the self-employed that take place largely beyond the reach of government regulation. Informal sector workers typically are not registered with Mexican Social Security, do not appear on any official payroll, have no taxes deducted from their wages, and are not protected by state health and safety regulations. Various research studies in recent years point out that, especially in Mexico's northern border cities, informal employment is decidedly not synonymous with poverty; for older males especially, informal self-employment typically offers higher income potential than employment in a formal enterprise such as a *maquiladora* (Roberts 1991; 1993). Our interviews in Juárez confirmed this. A number of working men reported that they could earn two and one-half to three times more as informal laborers in construction than they could in the *maquiladoras* as machine operators (a formal occupation).

Informal employment, when defined in these terms, reflects not so much the massive pursuit of subsistence alternatives to unemployment by the urban poor, but instead the inability of the Mexican state to regulate effectively the multitude of small-scale commercial activities undertaken by its citizens. Using results from the *Encuesta Nacional de Empleo Urbano*, Zenteno (1993) estimates that at the end of 1989, 29.3 percent of workers in Juárez were not covered by Mexican Social Security and that up to 47 percent of workers were employed by enterprises that could be considered informal by one definition or another. We also know from the ENEU that 17.4 percent of Juárez's economically active population consisted of self-employed workers, most of whom were informal (Browning & Zenteno 1993). Many workers employed informally are in fact poor and working under highly precarious conditions. Many others, however, are quite gainfully employed by prevailing local standards, and may in fact themselves be employers. Because the employment of all informal workers (by definition) is incompletely regulated / documented by the Mexican government, many gainfully employed people in the informal sector might find it difficult to document their financial solvency in the ways requested of BCC applicants by the INS. Many of the interviews we conducted with Juárez residents confirmed this point:

- A housewife living in Rancho Anapra, a *colonia* opposite Sunland Park, New Mexico described her neighbors' situations:

  > Well, the requirements for the *pasaporte local* aren't many, but most of the men living around here can't fulfill them because they work in construction, you know. They don't have any kind of receipts, or pay stubs and they know that's one of the indispensable requirements you have to present—a whole year's worth, you know, of pay stubs. And that's why they can't do it. Most of the women around here work as domestics, and they don't get pay receipts, either. The people who work in the *maquiladoras*, well they have a little easier time of it, and I

[60] Interestingly, a number of illegal border crossers we interviewed in such *colonias* remarked that, although they worked in El Paso, they had no intention of abandoning their Juárez residences to live in El Paso. They had too much invested in their homes, which were not readily salable, and could see no affordable housing alternatives for themselves and their families on the U.S. side of the border.

think that there you'll find people who have their *pasaporte local*.[61]

- The proprietor of a small grocery store, also in Rancho Anapra, was recently able to get BCCs for himself and his wife by presenting his tax receipts, bank statement, and business registration papers to the INS. Getting the BCC for the two of them was "no problem." His grown son, however, was unable to demonstrate his financial solvency to get the BCC because although he worked full-time for his father, he was not on the official books of the business.

- Another man residing in Rancho Anapra paints cars for a living and lives with his family on a plot of land to which they have no title. They built their home, a small cement block cubicle, themselves, and do not receive any public utilities (they have to pirate their electricity). He would like to get his Form 13 and BCC but has virtually none of the documents required to prove his residency and financial solvency.

- A man in his twenties selling fruit from a stall at the Cuauhtémoc market would like to get his BCC, but "doesn't get paid by check" and thus is unable to present pay stubs documenting his employment. He has lived in Juárez all his life.

- A twenty-six-year-old man, and lifelong resident of Juárez, was waiting in line on the Paso del Norte Bridge to apply for the BCC for the first time. Until a year ago, he had always worked as a journeyman mason in the construction industry, and had never appeared on anyone's official *nómina*, or payroll. Since last year, he has been working as an electrician at a *maquiladora* and just now has completed a full year's set of pay stubs.

- A businessman eating lunch at a restaurant in the Cuauhtémoc market had no problems getting his BCC because he had all his business papers in order. He believed, however, that employees would have a harder time documenting their status:

  > In my opinion, the requirements the Americans demand [for the BCC] are too tough. Because a lot of people are working, that have been working for some time, and due to negligence on somebody's part, because of the way Mexicans operate—we don't file our checks, and we don't keep our payroll and other books completely in order. For that reason, a lot of people have problems trying to get together all the paperwork that the United States asks for. . . . The problem is all the paperwork they ask for. A lot of people meet the requirements [of financial solvency], but getting the paperwork is impossible because we don't keep our books the way they want us to.

- Jose Alberto Silva, Juárez's *director del gobierno* was well aware of the difficulties encountered by the informally employed in obtaining the BCC:

  > Unlike in the United States, in Mexico not everybody is registered with the government. In the United States everybody is registered through the Social Security system. But here in Mexico it's not possible. We don't have that mechanism, that kind of registry. In Mexico, for example, I know some people who are carpenters, or who run other small businesses for themselves. And they don't take care of their taxes properly since they work alone. In order to get a permit to enter the United States, they ask these people for many documents. The truth is that these people do have jobs. But they can't prove it because they aren't registered in any way like the United States has with Social Security. . . . In our country this is a very large

[61] All interviews of Juárez residents were conducted in Spanish. Direct quotes appearing in this section of the report are translations.

> group, these kinds of people. They could be maids or mechanics. In these types of activities people work and have money, but they have no way of documenting it. And they have a hard time obtaining permission to enter the United States.

We also interviewed and observed INS officers involved in the BCC application and issuance process. As noted above, the law grants INS officers almost total discretion in determining a BCC applicant's eligibility for entry into the United States. We found these officers to be aware that for many working Juárez residents it is not possible to obtain all of the documentation of solvency that the INS flier indicates are required for issuance of the BCC. Many of these officers are Mexican-Americans who have lived in El Paso for many years, and some still have relatives living in Mexico. As a result, they are aware that the BCC requirements do not always correspond well to Mexican reality, and they are willing to be "flexible" in whether absolutely all the documents listed on the flier must be presented.

A self-employed carpenter, for example, who could not produce pay stubs because he worked for cash for many different clients, could be issued a BCC—according to one of these INS officials—if he could present bank statements showing frequent deposits of sufficiently large amounts so as to reasonably support himself and any dependents he might declare. According to these officials, there is no set amount of money that one must have in the bank in order to be considered solvent—it appears to be left to the judgment of the officer reviewing the application. We received one indication of how subjective such determinations of status can be when one agent told us that he had approved an older, self-employed man's application mainly because he saw that the man had "hard-working hands."

Another agent described his attitude towards the application process:

> Poor people have rights, too. My grandparents were Mexican and they were poor, poor but honorable. People of scarce means that can prove to me that they work for a living and only want to come over here to shop, since some things are cheaper to buy here, can get a *mica*. Above all it's necessary to be humane. If you have any doubt about some case, before rejecting it, you have to ask the opinions of the other officers. . . . It's all about giving the best service possible and issue *micas* to everyone who qualifies, and even more so if it's poor people.

In spite of the statements of individual agents regarding their own flexibility in considering documents presented by BCC applicants, the INS chief of the Paso del Norte port of entry insisted that all his inspectors apply a common set of criteria regarding applicants' proof of solvency. The most important of these, and one to which he said no exceptions are made, is that applicants present documentation of at least one year of continuous employment up to the time of presenting the application. Further, by making clear to potential applicants before they apply that they will be required to present documentation of their solvency, the INS makes sure that people who are unlikely to have their applications approved do not even bother to apply. The fliers distributed by the INS at the ports of entry to El Paso are one indication of this. Another strong piece of evidence is that officials of the Mexican *federal delegacion* in Juárez inform applicants for the Form 13 that the INS will require them to produce documentation of their economic solvency, in the form of pay stub, tax receipts, bank statements, and the like, before it will issue them the BCC. Information about the BCC application process is also disseminated via Spanish-language radio programs that have been broadcast in El Paso and Juárez since June 1993 and that allow listeners to call in questions about the BCC to on-the-air INS officers. While exceptions to documentation requirements may be made on a case-by-case basis by individual agents, the INS public position is clearly that documentation of one's stable employment and income is expected.

After interviewing dozens of Juárez residents about the BCC in a number of different situations around the city—in working class *colonias*, at the Cuauhtémoc market, with families waiting in line to be given their application interview appointment at

the Paso del Norte Bridge, and at *maquiladora* gates at shift's end—we reached an additional set of conclusions regarding people's knowledge and experience of the BCC:[62]

1. Most Juárez residents are aware of the existence of the BCC and the documents required to obtain it. Everyone we interviewed, whether they had ever applied for one or not, knew what the *pasaporte local* was. They also knew that one must demonstrate financial solvency to qualify for the BCC, and that this meant, in most cases, being able to present the INS with a full year's worth of pay stubs from a full-time job in Juárez. Consequently, virtually all of the persons we interviewed knew whether they themselves could meet the INS official documentation requirements.

2. Getting the BCC is not a problem for those who can produce the required documents. Those people we interviewed who had obtained their BCC did not report having had any particular difficulties in negotiating the process. The documents they needed were not costly to obtain (legally)[63] and nobody complained of having been badly treated by any Mexican or INS officials during the application process. Some people did complain of the inconvenience of having to wait all day in line at the Mexican *delagación* for their Form 13, and then having to wait all night again on the Paso del Norte Bridge to get their application appointment, but this inconvenience was clearly outweighed by the benefits of obtaining the BCC.

3. Long-term residents of Juárez are more likely than more recent arrivals to qualify for and obtain the BCC than more recent arrivals from other parts of Mexico. Because over the course of a lifetime, individuals and their family members may work in a variety of occupations, longer-term residents of Juárez are more likely to have worked at some point in time in a formal-sector job that provided them with the documentation needed to demonstrate financial solvency. Many long-term Juárez residents first obtained their BCC as dependents of their parents, and as the BCC has no expiration date, they still are able to use it. Long-term residents are more likely to live in established neighborhoods fully served by public utilities. They are also more likely to view the BCC as a document that is both obtainable and worth having, having known about it for most of their lives. Although long-term residents of Juárez are more likely to qualify than newer arrivals, some of them miss the opportunity to get their BCC. This is because individuals may meet the BCC requirements at one point in their lives, but not at a later point. If they fail to see the need for a BCC at the time they have access to the required documentation of their eligibility, they may lose the opportunity for the rest of their lives

4. It is not uncommon for Juárez residents without a BCC to have immediate family members who do have one, and *vice versa*. We interviewed many people whose immediate family members—sisters, brothers, parents, and children—do not share their own status as a holder or nonholder of a BCC, even though all family members have lived in Juárez for the same amount of time. This situation seems to be more common when immediate family members do not live with one another, particularly in the case of siblings, and presumably do not participate in a common household budget.[64]

5. Many Juárez residents, both long-term and shorter-term, have no interest or need to go to El Paso regularly, and thus do not apply for the BCC (nor do they enter the United States illegally). A substantial portion of the people we interviewed in

[62] We gleaned little information in our interviews about individuals who use the BCC to work illegally in the United States. Such persons were presumably not in Juárez during weekday working hours when most of our interviews were conducted. While we also interviewed many individuals in El Paso, it was exceedingly difficult to find people who were willing to admit to working illegally there and to let us interview them about their experiences. We do know from other sources, however, that many BCC holders do work in El Paso. See Chapter III of this report for estimates of the magnitude of this phenomenon.

[63] It can be difficult, however, for persons who have migrated to Juárez from elsewhere in Mexico to obtain official copies of their birth certificates if they have lost the original. This is especially the case for older individuals or persons from rural areas.

[64] Many people we interviewed also had immediate family members living in the United States, some legally, some not.

Juárez, from among a variety of working class occupations and neighborhoods, said that they had no reason to apply for the BCC as they had no need to or interest in going to El Paso or the United States.[65] Part of the reason for this may have to do with the self-perpetuating nature of residential and occupational segregation as it exists in any large metropolitan area: people tend to restrict their routine geographical movements to areas around where they live and work. Just as many residents of the Bronx may have never been to Staten Island and see no need to ever go, many working people in Juárez have virtually no knowledge of or relationship with El Paso or people living there. The fact that El Paso is, of course, in another country, and one that is perceived as not particularly welcoming of working-class Mexicans, only makes this phenomenon stronger. Here, as above, it is worth quoting a few of our informants directly:

> I don't need a *pasaporte local* because it's just the same over there as it is here. (Man, mid-twenties, working as a vendor in Cuauhtémoc market)

> I wasn't thinking about getting my *pasaporte local* when I started working here. I wasn't interested in going [to the United States]. It looks like they treat Mexicans very badly over there. . . . For us, Mexico is better. We've seen on television how badly they treat Mexicans in the United States. (Seventeen-year-old woman, lifelong Juárez resident, *maquiladora* employee)

> No, I didn't go into the *maquiladoras* to get my *pasaporte* [local]. Because going over to the other side doesn't interest me. The United States doesn't interest me. Not even to shop! Because I say that what there is over there, we've got here, too. I'm not going to go over there just because a few things are cheaper! Sometimes it's better for a person to just to stay around here in Juárez, in their own Mexico, and not over there where they're going to be against you, look down on you. (Twenty-four-year-old woman, native of Durango who has been living in Juárez for three years and working in a *maquiladora*)

> I don't visit the United States. I don't consider it necessary. Anything you'd want is here. We don't need to go over there. (Thirty-one-year-old man, native of San Luis Potosi, living in Juárez for seven years working in a *maquiladora*)

> It doesn't pay for the person who has his/her job or studies or something like that to come here. My brother is one of those people. He'll never get his crossing card! And now that a lot of American products are imported into Juárez he and his family buy things there. Sometimes they ask me or my mother to bring them things. It's no problem for us. We go to see them in Juárez, too. They're so close! The ones who have problems are the ones who live far away and can't cross the border. (Woman, former resident of Juárez, now living legally in El Paso)

6. Obtaining the BCC is seen as a fringe benefit of working in a *maquiladora*. We interviewed a number of *maquiladora* workers, both women and men, most of whom had obtained or were in the process of obtaining their BCC. While no one we interviewed stated that they themselves had taken a job in a *maquiladora* principally in order to get the BCC, many acknowledged that one of the fringe benefits of their employment was the ability to qualify for it after a year of work. Nobody indicated definitively that once they had obtained the BCC they would leave *maquiladora* employment to attempt to work in the United States, although some

[65] Interestingly, even a number of the people we interviewed waiting in line for their BCC on the Paso del Norte Bridge stated that they had qualified for the BCC for some years, but only then had gotten around to applying for it. The main reason given for not having applied sooner was that they had no need for it up until now. The pressing need now, typically, was to shop for better prices and merchandise in El Paso. Some people reported that their economic circumstances had recently changed, making the potential savings gained or particular product obtained more urgent for them.

clearly considered that to be one option open to them. Young adults working in the *maquiladoras* are able to get BCCs for other family members living with them, including their parents, based on their *maquiladora* employment. People we interviewed who did not work in the *maquiladoras* generally regarded *maquiladora* employment as low-paying and otherwise unattractive, except for the fact that such employment facilitated obtaining the BCC.

7. Some persons in possession of the BCC formerly entered and worked in the United States illegally. Several people we interviewed who had obtained their BCC based on their current employment in Juárez had, at some earlier point in their lives, worked illegally in El Paso or elsewhere in the United States. These people preferred to live and work in Juárez under less precarious circumstances than they had experienced in the United States working illegally. At the same time, the BCC offered them the possibility of access to certain of the economic benefits, in the area of personal consumption, that they had formerly accessed by entering or residing in the United States illegally.

8. Mexican residents who do not possess valid border crossing documents themselves often still attempt to cross into the United States at official ports of entry. To avoid bottlenecks in the flow of pedestrian and vehicular traffic on the international bridges between El Paso and Juárez, INS inspectors do not ask every crosser to produce documents, nor do they inspect all requested documents very closely. Often, inspectors will only ask entrants for a verbal declaration of their U.S. citizenship before letting them pass. Before Operation Hold the Line, this meant it was possible, albeit risky, for crossers to enter the United States with improper documents or no documents at all. After Operation Hold the Line began, INS inspectors began checking entrants' documents much more closely, and uncovered many cases of Mexican nationals using invalid, fraudulent, or other improper documents to attempt to enter the United States. **Table 43** presents a summary of documents confiscated at the Bridge of Americas Port of Entry from September 1993 through January 1994. Interestingly, the most common type of misrepresentation detected was the use of fraudulent U.S. naturalization papers. While almost no one appears to attempt to cross with an altered or fraudulent BCC, a fair number of people seem to attempt to cross with someone else's card, presumably betting on lax inspection of the photograph it bears on the part of INS personnel at the port of entry. Other

common misrepresentations include using a counterfeit Legal Alien Permanent Resident Card [LAPR] or using someone else's "green card."

One kind of misrepresentation that cannot be picked up at the port of entry is the use of falsified documents to obtain a valid Border Crossing Card. Several informants we interviewed in both El Paso and in Juárez averred that the purchase of fake pay stubs, birth certificates, employment letters, utility receipts and the like was not uncommon among persons who desired a BCC but could not otherwise obtain the necessary documents to present with their application for it. The most ingenious account we heard was that of a woman whose sister had obtained a BCC by purchasing false documentation of her employment from a man working in the personnel office of a *maquiladora* in Juárez. The INS does routinely make calls to employers to verify the employment of BCC applicants; in a case such as this verification was useless as the company official was a participant in the scam. As with the frequency of the incidence of misrepresenting oneself with improper documents at the port of entry, it is impossible to estimate the frequency of this sort of fraudulent acquisition of the BCC. Documents seized are only those discovered, and the number discovered depends not only on the number in circulation but also on the amount of effort made to detect them.

Effects and Responses

Based on our field interviews in both El Paso and Juárez, we reached the following conclusions about the effects of Operation Hold the Line on illegal crossing and illegal crossers.

1. Illegal crossing is now much more difficult than it was before the Operation began. Absolutely everyone we interviewed who has attempted illegal border crossings in the El Paso area acknowledges that doing so is much more difficult than before September 1993. Those who attempt to cross are more likely to be detained than before and are obliged to make their attempts at night and/or by going around the Operation to cross at deserted locations near Sunland Park, New Mexico or Fabens, Texas. These attempts are time-consuming and arduous. Several of our informants on both sides of the border have commented that the intensity of the blockade of the border has diminished since its first month. While crossing now is easier than it was in that first month, it is still more difficult than before the Operation began.

2. Some illegal crossers have given up crossing; many people who have other income alternatives in Juárez have given up working in El Paso. Unemployment in Juárez is low relative to the rest of Mexico; jobs are available in the *maquiladoras*, in construction, and in domestic service. The pay for these jobs, however, is quite low relative to the cost of living. Older illegal crossers, particularly older women, have largely given up illegal crossing, regardless of the loss of income. They simply do not see the benefit as being worth the increased risk and difficulty of making arduous, nighttime crossings. Many street vendors gave up crossing after the Operation began because of their inability to get through the Border Patrol linewatch quickly and surreptitiously while loaded down with fruit and other wares to sell.[66] Some of these vendors took up selling in downtown Juárez instead, including to drivers waiting in line to enter the United States on the Paso del Norte International Bridge. All former illegal crossers who earned incomes in El Paso before the Operation began have experienced a loss of income; for some this loss has been catastrophic, for others, who have other family members working in Juárez, it has been less so, particularly if they themselves have been able to find other work in Juárez. Some recent migrants to Juárez who earned their living in El Paso's underground economy were forced to return to the Mexican interior following the Operation as their remaining personal and/or family resources were insufficient to maintain themselves in Juárez.

3. Illegal crossing is still possible and many people continue to cross illegally, though fewer than the before Operation Blockade/Hold the Line. The line of agents posted along the border by the Border Patrol is penetrable, particularly away from the

[66] Former El Paso street vendors we interviewed reported that they could make $120 or $130 per week selling fruit in El Paso. In Juárez they would be lucky to make one-third that amount as vendors and one-half that amount in other occupations.

downtown areas where several physical barriers, such as fences and aqueducts, make a speedy crossing impossible. This was corroborated in our interviews with illegal crossers on both sides of the border, by their legal coworkers in El Paso, social service providers in El Paso who still serve nonresidents, and Border Patrol agents. Since the beginning of the Operation, the number of agents on duty at any given time has been reduced and, as a result, Border Patrol vehicles are stationed as much as one-half mile apart in some areas. Fewer agents are available to make actual apprehensions of illegal crossers who have breached the first line of defense. Moreover, boredom, disillusionment, and fatigue have resulted in some Border Patrol agents not proving to be very good sentinels, sometimes allowing illegal crossings while sleeping or reading in their vehicles, and other times simply not intervening in time to halt an illegal crossing in progress.

> They slip through [the line of the operation]. You can cross at night. At dawn or at night. You know, the *migra* stands sometimes half a mile apart, and you can slip through the line. It's a lot harder. [The ones who get through] are fast runners, they're young. I know one woman that crossed that we'd had in the shelter for a long period of time, has an American kid. The American kids had to stay over there [in Juárez] with the mother, but she crossed to work as a domestic. Many of these people, they send money back, because here they eat, there they don't. (Ray Tullius, Director, El Paso Homeless Coalition)

> I asked him how he'd done it. I thought with the blockade, he wouldn't be able to come any more. So when I saw him again at work, I asked him, "How did you do it?" He told me at two in the morning, through the desert. He said that several of them cross at once. They get together. If the see the Border Patrol agents, and the agents run to try to catch them, they all run in opposite directions, but towards the other side. Whoever gets away, well, he gets away! (Mexican maid who lives and works in El Paso relating the tale of a gardener she sees working at one of the houses she cleans)

> Like out away from town, the day before yesterday, the Border Patrol wasn't around at all. And I was getting my nerve up to cross right then, but I didn't cross because of my kids there in Juárez. What am I going to do with them over there and me over here? So, I'm going to take my kids back down to Durango and then come back across again at Anapra, because it's safer there. (Mexican woman who formerly sold fruit on the street in Juárez, interviewed in El Paso)

4. Juárez residents who use their border crossing card to work illegally in El Paso have responded to more rigorous inspection and interrogation of bridge crossers by crossing at times when it is more believable that the purpose of their visit is other than to go to work. When Operation Hold the Line began, INS inspectors on the international bridges confiscated the border crossing documents of some Mexican entrants who made apparently false claims about the purposes of their visits to the United States. Reports abounded of persons being turned back at the border for claiming to make shopping trips at 7:00 AM with only a few dollars on their person.[67] Illegal workers and people who live or work with them who we interviewed concurred that many crossing card abusers have taken to crossing the bridges at hours when it is easier to convince INS inspectors that they are make a shopping trip or a social visit. A Mexican maid we interviewed in El Paso had this to say:

> A lot of maids have their crossing card and come across to work. But they don't cross early in the morning anymore. They cross later in the day. They're afraid that if they cross early in the morning they'll be caught. They'll be asked, "Where are you going? All

[67] Here it seems that a few isolated incidents were greatly magnified by the power of rumor and sensationalist media coverage.

> the stores are closed now. What will you be doing?" And they also have to carry some money on them, enough to be able to justify that they're going shopping. Because sometimes they'll run into an immigration agent who wants to examine the contents of their purse. I've seen them do this.

5. Those who continue to cross illegally do so less frequently, but stay over longer periods of time in El Paso. Illegal crossers, as well as people who associate with illegal crossers, say that they cross the border less frequently than before the Operation because crossing is more difficult and the likelihood of apprehension is greater. For people who do not spend the night in El Paso, this means a substantial loss in income compared with before the Operation, because they work fewer days in El Paso. They are typically men who work irregularly in El Paso cutting grass, trimming hedges, or as construction day laborers. Crossing at less frequent intervals for them does not imply the loss of a job, for they did not have a regular work schedule in El Paso before the Operation began. For others, such as nannies, housekeepers, and skilled trades people, whose employers expect them to keep a consistent schedule, the response has been to cross less frequently, but sleep over in El Paso several nights in a row, or even for up to a week or two. Some maids and nannies moved in with their employers. Other illegal crossers stayed with relatives, or rented a room from a Mexican friend or acquaintance in El Paso. Some outdoor construction and yard workers took to sleeping under the desert stars on the mountainsides surrounding El Paso.

> I used to work as a housekeeper in El Paso, but now I'm an operator in a *maquiladora* here in Juárez. I quit crossing [illegally] with the blockade. Lots of people were detained. A lot of us women used to cross, and then we just couldn't any more. . . . The people who still manage to cross, well, we don't see them again for a long time, or we only hear from them by phone. . . . Most of them are staying with the people they work for, or with some friends or family, if they have them in El Paso.

In our interviews, we also received secondhand reports of illegal crossers who have abandoned their Juárez residence altogether since the Operation and moved to El Paso to live as well as work. Given the disincentives for revealing their identity as illegal residents, we were unable, however, to interview any of these persons directly.

6. Some undocumented Mexicans residing and working in El Paso are now cut off from friends and family in Mexico by the Operation. Not all illegal border crossers, either before or after the Operation began, lived in Mexico. Undocumented Mexican residents of El Paso are also obliged to cross the border illegally if they wish to visit friends and relatives or to conduct business in Mexico. These people may be members of households that include members who are legal residents of the United States, including Anglo and Mexican-Americans, Mexicans who are legal permanent residents of the United Sates, Mexicans who legalized their residence under the Immigration Reform and Control Act, and U.S.-born children of Mexican immigrants.

> One of the things that this blockade has done—many of our families in El Paso are "mixed," which means . . . I married a woman from Juárez! Many of us have intermarried across this river. Now it takes some time for the Mexican woman to become legalized, and it cost me $800 to legalize my wife and her son. Now many of these people don't have that: $800, that's their life. So many of these women that are tied there throughout El Paso are living with American kids, an American husband, sometime who runs off, with extended family in Juárez. Now she's illegal—she's technically illegal. She cannot cross. She's stuck on this side with her American kid with her family across the river. That's prevalent, all throughout this place! Right now, she can't go back. And Immigration could technically pick her up and tell her "Go back." And here you've got five American kids, who go back over there and they're not supported in Juárez because they're American kids. They don't participate in any of the social services [in

> Juárez] because they're foreign kids. (Ray Tullius, El Paso Homeless Coalition)

Before Operation Blockade/Hold the Line, illegal border crossing was relatively easy, and Mexican nationals residing illegally in El Paso more readily could maintain relationships with friends and kin still residing in Mexico. Many times these cross-border relationships among families consisted of a parent or an adult child living and working in El Paso and returning regularly to the rest of the family on the Mexican side with money and goods. Operation Blockade/Hold the Line, by making the maintenance of these kinds of relationships more difficult, also generates some incentives for family residential reunification: the family member living in El Paso may return to live in Mexico, or other family members may seek to move to El Paso.

7. Once across the border, undocumented Mexicans are less likely to be picked up by the Border Patrol than they were before the Operation. Illegal border crossers we interviewed in Juárez and El Paso, as well as residents of Mexican immigrant neighborhoods in El Paso, concurred that since the Operation began, Border Patrol surveillance of El Paso neighborhoods and workplaces had abated noticeably. As a result, undocumented Mexicans, once they had crossed the border, faced a decreased chance of being detected and deported by the Border Patrol. For example, a Mexican resident of an El Paso apartment building located in El Paso near Chamizal Park on the border, reported:

> Down where I live you used to see the Border Patrol passing by the entrance of my complex fairly frequently. Now you never see them. They used to make sweeps through the neighborhood, and people used to hide or we used to hid them! [Laughs.] A lot of them would dive under parked cars to hide when they would see the Patrol. They would hide however they could!

This decrease in Border Patrol surveillance of areas in El Paso located away from the border has made illegal worker' strategy of extending stays in El Paso all the more sensible. Whereas before Operation Blockade/Hold the Line, illegal crossers who worked illegally in El Paso feared apprehension at all times while in the United States, now their risk of capture is restricted to the moment of crossing. Moreover, the risk of apprehension while crossing illegally has risen considerably. Hence it is a good strategy to try to maximize the work days in El Paso gained per illegal crossing. The same logic applies to persons who abuse their Border Crossing Card by using it to work illegally in El Paso.

Many of these conclusions are embodied in the case of one Mexican man working in El Paso whom we interviewed in April 1994. His story follows.

Reynaldo Rodriguez [a pseudonym] is a skilled mason who works as an independent contractor to homeowners in El Paso. Now in his mid-forties, he moved to Juárez from his hometown of San Francisco, Chihuahua in 1972. Before he began working in El Paso five years ago, he worked for many years in the construction industry in Juárez. He has always earned his living as a mason. He lives in Juárez with his family in Colonia Felipe Angel. He has eleven children, ranging in age from fifteen months to twenty-five years old. Four of his children work in *maquiladoras*; his wife does not work outside the home.

Mr. Rodriguez does not have a Border Crossing Card because he has always worked informally in the construction industry; moreover, he is not in possession of his birth certificate, which he lost many years ago. Nobody else in his family holds a BCC, although one of his daughters plans to apply when she completes the required year of employment at her *maquiladora* job.

As a mason in El Paso, Mr. Rodriguez can earn up to $150 a week; doing the same work in Juárez, he would be lucky to clear $100. The additional money he is able to earn in El Paso is essential to him, given the size of his family. By the same token, having such a large family obliges him to live with them in Juárez, where the cost of living, especially for housing, is considerably lower than in El Paso. He prefers working independently for private homeowners because on a construction site in El

Paso he would have payroll and social security taxes deducted from his check. He gets work from homeowners based on recommendations from people he has worked for in the past. He believes he is paid fairly for his work and has generally been treated well by his various employers.

We interviewed Mr. Rodriguez one afternoon when he was at work laying a brick stairway on the grounds of a home in an affluent section of El Paso high on the slopes of a mountain northeast of downtown. He spoke unreservedly about his experiences crossing the border illegally, both before and after Operation Hold the Line.

Mr. Rodriguez told us, as have many other with whom we spoke, that crossing the border illegally, even downtown during the day, was fairly easy before the implementation of Operation Blockade / Hold the Line. He used to cross back and forth to work almost every day. When the Operation began, he was taken by surprise and was unable to get across the border for the first month or two. After that, he found he was able to make the crossing, although it was difficult, and he had to do it at night.

> When they began the blockade, yes, we did go a month or two without being able to cross. I mean, the surveillance was more intense. And now it seems that things are getting back to normal so that one can cross.

Mr. Rodriguez usually makes his crossing now at a point on the Rio Grande known as Las Piedras next to the big ASARCO smelter in El Paso. He crosses the river by himself at night, but sees many other people crossing in the same place. He describes his method of crossing:

> Well, we just wait until they aren't in the spot where we want to cross, you know. Because they're not there, you know. In other words, they're not planted right there in the spot where we want to cross. And, if they are there, why sometimes they're asleep! And we cross! We cross, and it's no problem. It hasn't been very difficult. I guess that now they recognize you as someone who is coming to work. You're not coming to, you're not one of those that they say is coming from over there to steal. They're looking the other way then, once they begin to recognize you, it comes to people coming across to work. They know full well that you're coming to work. Sure, they see us cross. And they don't do anything. . . . When I cross [the Border Patrol vehicle] is about sixty yards away. Sometimes they see us. Or, as I say, they're asleep. . . . When they detain me, it's because they see me, and I stop, and that's it! Why would I try to run? It just makes it a bigger crime.

He has been apprehended by the Border Patrol two or three time since the Operation began. Being detained by the Border Patrol is "no big deal" according to him. They just ask him for his personal data and return him to the Mexican side. He then goes home to bed to get some sleep before attempting to cross again the next night.

In spite of the added difficulty in crossing illegally, Mr. Rodriguez still feels obliged to do so. He needs the extra money he can make in El Paso to support his family. He believes that the Mexicans who have stopped crossing since the Operation began weren't really coming over to work. He claims to know many people who continue to cross illegally in spite of increased surveillance of the border:

> Yes, I know quite a few people who still cross. Out in the *colonia* where I live, well, there in the same street where I live, there are some ten people who cross, aside from those we meet on the way [across the river].

If the border were someday effectively sealed, he supposed that he would go back to working in the construction industry in Juárez, as he did before he stared working in El Paso five years ago.

Because of the increased difficulty in crossing illegally, Mr. Rodriguez has tried to minimize the number of crossing he has to make. Whereas before the Operation began he crossed daily, he now limits his crossings to two or three per week. He rents space

in an apartment with some kin who live in El Paso. Other men he knows have taken to sleeping out under the stars in the desert near where they are working.

> A lot of people, at times they go out into these little gullies there, where they sleep. And they come out of there to work. They go downtown to eat dinner. Because up here the bosses give them their midday meal, you know. So they go downtown to eat dinner, they come back up here, and wherever it gets dark on them, that's where they stay. Nobody complains about them sleeping up here. No problems.[68]

Mr. Rodriguez says that even before Operation Hold the Line began, he had never been apprehended by the Border patrol once he had made it past the agents right at the border itself. He says now that he doesn't worry at all about being picked up in El Paso.

We also had the opportunity to interview Mr. Rodriguez' employer of the moment. The owner of the house where he worked was a real estate agent in her early fifties, the product of a mixed Mexican-Anglo marriage. She spoke Spanish fluently. She remarked that while immediately after Operation Hold the Line began some of her friends in the neighborhood complained of losing their help or having them not show up for a period of time afterwards, Mexican laborers had generally continued to be available for domestic service since the blockade without any major interruption. This woman described her own attitude regarding employing undocumented Mexican laborers:

> I had a yard guy that worked for me for seventeen years and he told me that he was under the amnesty. I don't ask! If you asked me about him, I don't ask about him [Mr. Rodriguez]. I don't ride him in my car and I don't ask him. He works for the guy below [her neighbor down the hill], that's where I got him from, and I don't ask. I don't think I have an obligation to ask, if I've got a yard guy, you know. I might, but I just don't ask. What I don't know doesn't hurt me, and I really don't want to know. That's the way I do it.!

Her ambivalent views regarding the ethics of employing undocumented Mexicans were also telling, reflecting the peculiar contradictions of living on the Mexican border.

> But the people who are coming and who are staying here, it's draining on the taxpayers, you know, hospitals and all the rest of it. On the other hand, these people are hungry, and they climb the mountain, you feel sorry for them. You know, they start across that mountain at two o'clock in the morning hoping to come get a job. And they talk about, I'm sure there are a lot of thieves and a lot of criminals, but there's a lot of honest people, and they should really come and give them some kind of thing for maid and yard work, because people here aren't going to do it. They're just not going to do it, you know. You can't get anybody to do maid service that lives here—they'd rather go collect welfare.

The views of interviewed Juárez officials were rather less ambivalent. They argued forcefully that the INS should create some mechanism to ratify legally a long-standing practice in El Paso-Juárez that they regard as beneficial to residents of both sides of the border: the employment in El Paso of noncitizen, nonresident Mexican workers, such as Mr. Rodriguez. Abelardo Escobar, Juárez' *secretario del ayuntamiento,* summarized these officials' views:

> We have made some comments at the meetings we have had with U.S. customs and immigrations officials. There are many people who live in Juárez and cross to work in El Paso who have done so for years. They work in homes as domestic help, they are employed in workshops. They work. A

[68] Mr. Rodriguez' account in this regard was corroborated by his employer, who mentioned that she regularly saw Mexican men sleeping under the stars on the mountainside near her house since Operation Blockade / Hold the Line went into effect.

> good, efficient, and honest work force. Thousands of people! Why can't there be some mechanism invented to legalize their situation? These are people who live here in Juárez who are not going to invade the interior of the United States because these people by tradition live here. This would greatly reduce a lot of the pressure in this area. Because it would benefit the community of El Paso as well. There are families and there are businesses that require these people. They have needed them and they have utilized them, and it has worked and has been of mutual benefit, as much for the businesses as for the American families as for the Mexican people. And they're not riffraff, they're honest people that go over there to work.

These local Mexican officials recognize the incentives low wages on their side of the border create for illegal border crossing. They claim that as long as the large wage discrepancy between Juárez and El Paso continues to exist, strong pressures to cross illegally into the United States will persist.

IX. SUMMARY

This chapter summarizes the major research findings from the analyses presented in the preceding chapters concerning the effect to date of Operation Hold the Line on illegal crossings and on other variables thought to be associated with such crossings. Examining the study's findings taken together, instead of individually in separate chapters, facilitates the formulation of an overall assessment of the extent to which the Operation has been achieving its objectives. It also provides a better perspective from which to consider any unintended negative side effects to be factored into the evaluation. Because the objective of this study is to provide an assessment of the Operation, not to formulate policy recommendations, we do not present recommendations concerning changes in immigration policy. Recommending policy is the task of the U.S.. Commission on Immigration Reform, which was established as part of the 1990 Immigration Act and charged with the responsibility of studying all aspects of U.S. immigration trends and policies and formulating recommendations for policy changes in its reports to Congress, the first of which is to be submitted by October 1, 1994. The findings of this research are, nonetheless, particularly relevant to certain immigration and border policy issues. Thus, the last section of this chapter outlines these issues and discusses the implications of the study's findings for each of them.

Findings

The major findings to emerge from the analyses presented above are:

1. Illegal crossings into El Paso have been substantially deterred by Operation Hold the Line;

2. The deterrent effect appears to have diminished the longer the operation has lasted;

3. Long-distant labor migrants have been less deterred from crossing by the Operation than other kinds of crossers because they seem to have shifted their crossing points to other locations along the border;

4. Legal crossers / illegal workers and illegal crossers / illegal workers appear to have changed the daily pattern of their crossings and to have extended the duration of their stays in El Paso;

5. Illegal crossers / illegal workers who engage in street vending and small-scale, low-level criminal activities have been substantially deterred from crossing;

6. Business activity in both El Paso and Juárez in general does not appear to have been substantially harmed by the Operation, although sales in downtown El Paso close to the bridges have declined somewhat and certain representatives on both sides of the border continue to claim that negative business effects exist;

7. The Operation may have led to a small reduction in school enrollment in the El Paso area;

8. The Operation appears to have led to a small decline in the number of births in El Paso as indicated by data both on registered births and on deliveries in Thomason Hospital;

9. The Operation seems to have caused a reduction in petty crime (small-scale, low-levelnuisance and property crimes), especially in downtown El Paso;

10. The Operation appears to have led to a small reduction in other property and violent crime rates beyond what would be expected given the long-term downward trend in these rates in El Paso (and most other cities of similar size). However, this decline may have come about because these kinds of crime were targeted for additional police activity in the months right after the Operation began.

11. The Operation has increased the rate at which illegal drugs and other contraband and illegal agricultural products have been seized;

12. The Operation appears to have received overwhelmingly positive public support in El Paso, although no representative scientific poll has been carried out that confirms this or that documents in which groups support is strongest and in which it is weakest;

13. Support in the Mexican-American community appears to be high, although most leaders of community organizations that we interviewed expressed opposition. Also, several Mexican-American leaders argued that this support was partly because Chief Reyes was Mexican-American, partly because the Mexican government had publicly acknowledged the right of the United States to control its own borders and to carry out the Operation, and partly because the new strategy reduced discriminatory Border Patrol actions against Mexican-Americans (e.g., agents stopping Mexican-Americans to questions whether they were illegal clients or not);

14. The Operation's change in border control strategy has resulted in substantial declines in charges of human rights violations and other abuses against the Border Patrol and, according to school administrators, to much safer environments around schools close to the border because agents are no longer chasing suspected illegal crossers through school yards and playgrounds or questioning Mexican-American students;

15. The redeployment of Border Patrol agents to shift-length, guard-duty responsibilities at the border may be causing substantial morale problems arising out of boredom and concerns about how performance will be evaluated under the Operation's new work conditions;

16. Some illegal Mexican immigrants residing and working in El Paso find it more difficult as a result of the Operation to visit friends and relatives in Mexico and then return to El Paso;

17. Once across the border, illegal crossers appear less likely to be apprehended by the Border Patrol than they were before the Operation; and

18. Some of the pressure to cross the border illegally in the past from Juárez to El Paso has derived from inconveniences in obtaining Border Crossing Cards; some of the current pressure results from persons who desire to cross temporarily and who meet the requirement necessary to obtain a BCC except that their employment in the informal sector means they do no possess the kinds of papers necessary to verify employment.

Assessment

Based on an examination of a wide variety of evidence, there is little doubt that Operation Hold-the Line has curtailed crossings into El Paso. According to the Border Patrol, the number of illegal crossings prior to the Operation was in the neighborhood of eight thousand per day (as based on photographs taken at selected points at selected times along the

border). Since the Operation, apprehensions have declined from about seven hundred a day in the comparable preblockade months of fiscal year 1993 to about two hundred a day in the months after the blockade.

It is difficult to know how such figures on apprehensions correspond to reductions in the number of border crossers (in part because the same individual can be apprehended more than once and because some crossers may be staying longer periods in El Paso). This is especially true in the post-Operation months when the usual relationships between the amount of enforcement effort and apprehensions seem to have reversed their previous pattern. However, the number of crossers probably also has been cut substantially. This curtailment of illegal crossers into El Paso includes both workers and nonworkers. Our ethnographic data indicate that the former have been less affected than the latter. But the Operation has also changed the crossing patterns of those who cross intending to work.

The Operation has resulted in other intended and unintended effects as well. One intended effect was to reduce street vending by Mexican nationals in El Paso's downtown commercial district and in certain residential neighborhoods close to the border. The Operation seems to have been successful in reducing the participation of illegal crossers in this activity. One study, conducted by the University of Texas at El Paso, interviewed forty-six of the several hundred downtown street vendors before the blockade and found that 41 percent of these referred to themselves as "illegals" who lacked papers to work in the United States (Staudt 1994). One of the unintended effects of the Operation, as suggested by interviews with residents of Juárez as noted above was to encourage some Juárez commuter workers, particularly women domestic workers, to find places to live in El Paso in order to keep their jobs. This does not necessarily imply a complete abandonment of Juárez as their principal residence, but rather an effort to reduce the number of times they must make an illegal crossing per week or per month. The data examined in Chapter III on bridge crossings showed patterns consistent with this outcome.

Overall, based on the anecdotal and other evidence, we conclude that the Operation has been more successful in curtailing illegal migration among local crossers than among long-distant migrants. The latter can go around the line, either with the help of *pasamojados* or by choosing another entry point along the 1,900-mile border. Moreover, Operation Hold the Line makes the apprehension of long-distance migrants passing though El Paso even less likely, insofar as Border Patrol agents formerly deployed inland are now deployed right on the border. And among local crossers, differences in the extent to which the Operation has been successful exist by type of crosser. It seems to have been successful among certain illegal crossers/illegal workers (particularly street vendors and others like older female domestic workers for whom crossing has become especially difficult), and (especially) juvenile crossers. These types of crossers tend to be the poorest of the Juárez crossers.[69] Long distance labor migrants and legal crossers/illegal workers typically have greater financial resources as their disposal; otherwise they could not finance their long-distance migration or qualify for a Border Crossing Card. Legal crossers/illegal workers, as long as they have valid crossing documents and believable reasons for entering the United States, are perhaps even more free to work illegally, given the decreased presence of the Border Patrol throughout the city of El Paso. And by all accounts, those illegal crossers, including nonlabor crossers, who are well-integrated into the social fabric on both sides of the border, can still find ways to cross, including obtaining false documents and staying for longer periods with friends and relatives (who may also be illegal) in El Paso. Those nonworking crossers who have been entering the United Sates to give birth may have been deterred somewhat as evidenced by the small decline observed in births. But what has gone down the most, apparently, is the participation of illegal crossers in petty crime and street vending in south El Paso, activities most associated with juvenile crossers and other youths and adults from Juárez who sought to extend their information economic subsistence activities to the U.S. side.

[69] See Chapter VIII for information about socioeconomic heterogeneity within these categories.

Policy Implications

The principal stated objective of Operation Hold the Line was to eliminate illegal border crossings by persons from Mexico into the United States in the El Paso sector. Several broad lines of strategy might be drawn to achieve this policy objective, not all of which are mutually exclusive:

1. Illegal crossings might be physically deterred through increased policing or placement of barriers along the border (such as fences, trenches, walls, etc.);

2. The benefits of both legal and illegal border crossing could be absolutely reduced by eliminating sources of employment and consumption in the Untied States to illegal or insufficiently documented Mexican residents (by requiring fraudulent-proof identification, for example, and by requiring employers to check prospective employees' IDs);

3. The benefits of both legal and illegal border crossing could be relatively reduced by lowering disparities between the two sides of the border with regard to wages, prices, and the availability of goods, services, and jobs;

4. The ease of illegal crossing could be reduced relative to legal crossing by making legal crossing documents easier and less expensive to obtain;

5. The cost of legal crossing could be lowered relative to illegal crossing by increasing the number of legal ports of entry to the United States and reducing border-crossing fees; and

6. Illegal border crossing could be legalized.

Of these five broad lines of strategy, numbers 2, 3, 5, and 6 fall outside the purview of the local districts and sectors of the INS/Border Patrol. Numbers 2 and 5 would require action by the U.S. Congress, and number 3 would require concerted international cooperation between the U.S. and Mexican governments, as well as among industries in both countries. Number 5 would depend upon actions by other department/agencies of the Executive Branch of the U.S. government as well as the Mexican federal government (which collects northbound tolls). Strategy number 1 is the one emphasized in Operation Hold-the Line. Number 4, because it falls within the purview of the INS Border patrol in the El Paso district, could receive greater consideration given the relationship between legal and illegal crossings.

The research results hold several other implications, four of which in particular warrant discussion. One is that strategies number 1 and 4 often need to be considered together because of the relationship between legal and illegal crossings. As noted in Chapters I and II, the formulation of immigration policy needs to take into account that legal and illegal migration to the United States are often interrelated, particularly in the case of Mexican migration. Policies that restrict one can increase pressure for the other, and *vice versa*. In the case of El Paso/Juárez before Operation Hold the Line, the difficulty and inconvenience of obtaining BCCs led to increased numbers of persons crossing illegally. Many other crossed illegally, and continue to do so, because they meet the requirements for obtaining a BCC but are not able to provide the papers verifying that they do. Thus, border control strategies that make illegal crossings more difficult (as is the case with Operation Hold the Line) may increase the propensity to cross legally among those holding valid BCCs, and thus increase the traffic at, and pressure on, bridge check points. They also increase the desirability of obtaining BCCs to cross legally. Stated differently, closing what many have called the "safety valve" of illegal Mexican migration often serves to increase demand for legal migration, whether in the form of those seeking to settle as permanent immigrants or those seeking local border crossings into El Paso. The failure to take steps to meet the demand for local commuter border crossings is likely, in turn, to increase pressure for illegal migration.

The members of the research team frequently heard that a need existed before and continues after Operation Hold the Line to place more INS and U.S. customs personnel at the bridges to speed the pace of legal crossings. Increased personnel also are

needed to process BCC applications. Many observers in El Paso who support the goals and strategies of Operation Hold the Line remarked that it was unfortunate that effort had been devoted to curtailing illegal crossings but not to facilitating legal crossings. To the extent that the Operation is successful in curtailing illegal crossings, and especially certain kinds of illegal crossings, perhaps it will also serve to focus increased attention on the need to facilitate legal crossings. And, as the flow of certain kinds if illegal crossers diminishes, it may focus attention on a major remaining group whose members possess strong motivations to cross illegally—those who want to shop and visit friends and relatives in El Paso and who now meet the residency and employment criteria for a BCC but do not have papers to verify this because they work in the informal economy. Developing ways for such persons to cross legally, however, would involve the risk that crossers might abuse such a privilege for permanent illegal migration purposes and to obtain access to jobs and social services, rather than for temporary shopping or visitation.

Current holders of the BCC could retain and use their documents through their current expiration date or as long as they remain valid, without having to pay a fee. Not changing the status of current BCC holders could avoid creating disincentives for Juárez residents to shop and conduct business in El Paso. By legalizing the crossing of additional Juárez residents of financial means, El Paso businesses might also increase their sales to Mexican consumers. The border crossing licensing fee, if set at the proper level, need not discourage potential cross-border shoppers, either. The large business done with Mexican shoppers by such discount houses as Sam's Warehouse and Price Club, which have a membership fee, demonstrates that collecting a fee and making sales are not mutually exclusive propositions.

The second (and related) implication of the findings is that border control strategies and reward system design and implementation must acknowledge the multiplicity of different kinds of border crossers. As the United States and Mexico increase trade with one another as a result of NAFTA, it becomes more important that the border not become a bottleneck to the legal flow of goods and people necessary for the further growth of trade. Our field interviews indicated that individual Border Patrol agents informally engage in practices that involve related kinds of distinctions when they overlook the illegal crossings of persons they know are going to El Paso to work rather than to "cause trouble." If the logic implied by such practices were extended to the level of more formal border control strategies, it might lead to efforts to find new ways both to facilitate legal crossings and to develop border control strategies that penalize neither Mexicans who want to cross legally for legitimate reasons nor Mexican-Americans whose appearance makes Border Patrol agents think they might be illegal migrants.

It is also our conclusion that Operation Hold the Line has been more successful in curtailing some kinds of El Paso crossers than it has in slowing long-distance labor migration. The Commissioner of the INS, Doris Meissner, has announced that strategies similar to Operation Hold the Line will soon be implemented in all sectors west of El Paso. If the main objective of extending the Operation is to stop illegal labor migration to the United States, the question might be raised about the degree to which this will be effective without similar strategies being put into place along the entire United States border with Mexico. If the main objective, however, is to deter temporary crossers whose destinations are U.S. communities along the border, then operations similar to the one that has been in force in El Paso over the past eight months would seem to hold greater promise of success.

The third major implication flowing from the findings of this research is that, whatever the degree of effectiveness of Operation Hold the Line, its continued effectiveness will increasingly depend on finding ways to deploy and motivate Border Patrol personnel and that take into account that the new border control strategy appears to involve agents in long periods of inactivity as a result of their holding fixed positions from which they watch for crossers. This inactivity not only appears to be causing boredom, it seems to be raising anxiety that the new strategy does not entail the kinds of activities for which agents have traditionally been evaluated and

considered for promotion. As Operation Hold the Line is extended to other sectors, some sort of modified deployment strategy might be necessary to maximize long-term effectiveness.

The strategy implemented by Chief Reyes in El Paso of stationing agents right on the border, rather than having them search for illegals who have already entered the city, has received considerable national publicity. Some observers have expressed puzzlement that this new strategy has not been tried sooner and elsewhere. This reaction reflects a misunderstanding about the number of agents required to implement a border saturation strategy like Operation Hold the Line. Initiating such a strategy in El Paso seemingly required all the resources the sector could muster and then some. Supplementary funds were approved for overtime pay and agents were pulled off other assignments (such as employer sanctions investigations and desk jobs) and redeployed on the border. Operation Hold the Line is a very labor-intensive strategy and it seems evident that it has stretched to the limit the ability of the El Paso sector to carry out the functions it was performing before the Operation began. And as reported in Chapter VII, the long shifts served by agents appear to be harming morale and perhaps reducing their effectiveness.

In truth, the Border Patrol has probably never had a sufficient number of agents to implement border saturation strategies on a widespread scale. In FY 1994, Border Patrol agents numbered an estimated 4,343, the largest number in the history of the service. In FY 1984, by contrast, the number of agents was 2,333, a number probably insufficient to implement a strategy like Hold the Line. After the passage of the Immigration and Control Act of 1986, however, the number grew to 4,074 by FY 1988, an increase of 34.7 percent over FY 1985. Since then the number has declined, dropping to 3,684 by FY 1991, after which it jumped by 10.2 percent to 4,061 agents in FY 1992. Thus, if the present level of resources in the Border Patrol is stretched considerably by Operation Hold the Line in El Paso, this is also likely to be the case as the strategy is extended to other sectors.

Resources are all the more likely to be strained if efforts are made to redeploy agents so as to cut back the number of consecutive hours spent on what amounts to guard duty at the border. In the military, to achieve maximum vigilance at guard posts, troops are rarely assigned to more than two hours of guard duty at a time . While Operation Hold the Line may not require the intensity of vigilance necessary in the military, there is a real possibility that eight hours is too long for maximum effectiveness. Implementing shorter shifts would undoubtedly require more personnel, especially to the degree that the Border Patrol will continue to fulfill all the other responsibilities it has been allocated in recent years. At a minimum, it would seem worthwhile to conduct field experiments and evaluations to ascertain the most effective ways to deploy agents in field situations like Operation Hold the Line.

The fourth issue for which the results of this study hold implications concerns the question of how to evaluate evidence about the effectiveness of a change in policy or strategy such as that involved in Operation Hold the Line. As noted in Chapter III, observing changes over time in outcomes that are expected as a result of policy changes amounts to conducting quasi-experiments in which before-after comparisons are drawn. The difficulty of such comparisons for the observer, of course, is in making as sure as possible that observed postevent changes can be attributed to shifts in policy rather than to changes in other factors with which postevent changes might be associated. The results of this research demonstrate the need for care and caution in making judgments about such changes, particularly when the outcome that is being observed is itself changing over time because of factors having nothing to do with the change in policy.

Two examples from the El Paso situation are instructive. One of these was seized upon by supporters of Hold the Line as evidence the Operation was successful and the other was embraced by opponents as indication it was not. These examples involve crime statistics and birth data. It is easy to misread the meaning of these because each has been changing over time, but in different directions. Crime rates in El Paso, as elsewhere, have generally

been declining in recent years. This means comparisons of rates for post-Operation months with rates for the previous pre-Operation year will necessarily show a decline and thus appear to indicate a reduction in crime as a result of the Operation. Numbers of births, on the other hand, have been increasing, especially births in the Mexican-origin population. This means comparisons of the number of post-Operation births with the number from the previous year will show an increase if the Operation has had no effect on births, or they will show no change in births if the Operation has reduced the number of Mexican-origin births by an amount roughly equal to the annual secular increase.

The first of these relatively unsophisticated comparisons appears to show the Operation was working as intended; the second seems to indicate it was not. However, when crime and birth data are analyzed using procedures that take into account the longer-term trends in each of the variables, the results are different. The crime data generally show smaller effects of the Operation on major crime than the crude comparisons, whereas the birth data show that births seem to have declined by about 5 to 10 percent. This demonstrates that both supporters and opponents of policy changes should be cautious in claiming evidence that upholds a certain point of view. All sides to an issue are entitled to an assessment that strives to be as objective as possible and that seeks to use the best possible research methods in its work. Even such objective efforts are inevitably incomplete, however, especially when they involve assessments of ongoing processes as is the case here. Thus, continued monitoring of Operation Hold the Line and its effects is both necessary and important.

Immigrant Quality and Assimilation: A Review of the Literature

T. Paul Schultz

U.S. COMMISSION ON IMMIGRATION REFORM

The U.S. Commission on Immigration Reform is a bipartisan commission authorized by the Immigration Act of 1990 and charged with examining immigration policy and its impact on social, economic, and community relations, on population size and characteristics, and on the environment.

Introduction

This review summarizes the conclusions reached by recent studies of immigration to the United States. The central questions that motivate this literature are: How has the character of immigrants changed over time? How have these immigrants been assimilated and performed economically in the United States? What demands have immigrants placed on public services and income transfer programs? What consequences have immigrants had for native-born workers? These questions span a large field of study, and references and discussion of major issues of interpretation and uncertainty are of necessity selective.

Our knowledge of the answers to these questions is limited. One source of uncertainty stems from gaps in nationally representative data on refugees, on legal and illegal immigrants, and on emigrants leaving the United States by their origin, immigration status, and duration of residence in the United States. If resolution of these uncertainties would affect important choices before the United States, the cost of collecting more adequate data on immigration and emigration should be weighed carefully by Congress. Uncertainty in our answers also can arise from the limitations in the methods used by researchers studying these questions. In such cases it is not always possible to demonstrate how methodological improvements in an original study would affect its conclusions without time-consuming replication and extension of the basic research. It is generally not possible, therefore, to judge which methodological shortcoming in the existing literature will affect a particular conclusion. At several points, an indication is given as to the direction the bias might take.

The first section discusses how characteristics of cohorts of immigrants that enter the United States at different times can be compared, both with earlier or later immigrants and with native-born Americans. The appropriate reference groups are not clear, in part because immigrant subgroups cannot be distinguished and the native counterpart is not always obvious. The second section describes the conclusions from studies that attempt to quantify the assimilation process, where the standard practice is to compare the economic productivity or earnings of immigrant and native workers, although consideration of how well the children of the immigrants are assimilated might bring us closer to the long-run effects of immigration. Section three discusses the social consequences of legal and illegal immigration and the unresolved problems we have in assessing these consequences from local labor market studies. Finally, the

characteristics and assimilation of immigrants can be affected by immigration policies that can emphasize family reunification or skill-based selection of immigrants or humanitarian assistance to refugees. Policies that reduce the flow of legal immigration also can influence the flow of illegal immigration and those seeking refugee status. A final section recapitulates the findings.

The Quality of an Immigrant Cohort

The simplest and perhaps most adequate measure of quality of a cohort of immigrants entering the United States in a specific time period is the distribution of education in this population. Starting with the 1940 Decennial Census of the Population, representative data are available on both the years of educational attainment and the earnings of the U.S. resident population, often by immigrant status. Education has become the primary predictor of the wage rate, and education is linked to the productivity of people in both home and labor market activities. Education obtained by immigrants in their country of origin may be less relevant to the productive opportunities in the United States than that which native-born Americans receive. The quality or relevance of that education may differ, for example, by origin country (e.g., by GNP per capita) and, most notably, if the language of instruction is English (Jasso & Rosenzweig 1986, 1990a). Despite the incomparability of education between and among immigrants born abroad and natives born here, years of schooling is the most powerful single explanatory variable known to account for productivity in the U.S. labor market and elsewhere in the world. Education of parents also is critical for predicting the health and schooling attainment that the children of immigrants and natives obtain (Schultz 1984). Thus, in both the short run and over the immigrant's life cycle, education forecasts his or her own productivity; in the long run it forecasts the assimilation of the immigrant's children into the productive mainstream of the U.S. economy and society. The alternative to education as an indicator of quality is occupation. Occupations are, however, more elusive because individuals often change their occupation over their lifetime and because the economic meaning of occupation as a basis for social stratification and productivity changes over time.

The average years of education of immigrants entering the United States has decreased relative to native-born Americans of the same age and sex (Borjas 1992). In

1940, immigrant men had .8 more years of schooling than native-born men, and by 1980 they had .7 fewer years of schooling. Although the education of these immigrants increased from 9.5 years of schooling in 1940 to 12 years of schooling in 1980, that of the native population increased more rapidly. This deterioration in the schooling of immigrants *relative* to natives is associated with the changing composition of immigrants by region of origin, with the decline in the share coming from Europe (from 60 percent in the 1940s to 10 percent in 1981-1986) being replaced by a rising share from Asia, Mexico, and, more recently, other countries in Latin America (Abowd & Freeman 1991; Funkhouser & Trejo 1993). It also undoubtedly is related to the increased share of immigrants who are illegal (Fix & Passel 1994).

These estimates of education probably are are not seriously biased because virtually all individuals report their education in the Census. The margin of undercount of immigrants, and perhaps especially illegal immigrants, probably is greater than for natives, but this is not likely to be a serious source of bias in estimating the level or trend in education of the two populations. However, it should be noted that the distribution of education of immigrants is far from uniform. Recent changes suggest an increased concentration of immigrants with more education than native Americans (more than sixteen years completed) and far more with education levels below the average of natives (eight or fewer years). Consequently, the average education of immigrant cohorts masks a substantial degree of heterogeneity, and recent problems of assimilation of immigrants in the lower tail of the education distribution deserve emphasis (Fix & Passel 1994; Chiswick & Sullivan 1995; Simon & Akbari 1995). A large share of these recent less-educated immigrants are undoubtedly in the United States illegally, but data are not available to characterize this group.

Productivity of Immigrants

The comparison of the earnings of immigrants and natives is much more difficult than the comparison of education. First, everyone does not work in the labor force. There are a variety of reasons to think that the rules governing self-selection into the labor force may be different for the immigrant and native, and perhaps different for legal and illegal immigrants. Moreover, comparisons of earnings are generally restricted to exclude the self-employed, and one often observes that a

larger proportion of immigrants are self-employed than are natives. There also is a tendency for individuals to shift from being a wage earner to self-employed as they accumulate business capital and labor market experience, which is naturally correlated with their age. Thus, immigrant workers may be observed less often to be wage earners than natives, and they may shift out of wage-earning jobs and into self-employment as they are assimilated into the United States at a faster rate over their life cycle than do natives. It is not possible to know for certain whether these individuals, both natives and immigrants, who decide to work for wages are more or less productive than those who do not work for wages. It might seem reasonable to expect that the more successful are able to accumulate capital and have the motivation to become self- employed. Such a tendency would understate the productivity of immigrants relative to natives, and this understatement of immigrant assimilation could grow with duration in the United States. This source of bias downward in measured quality and the rate of assimilation of recent immigrant cohorts appears to be particularly noticeable among whites and Asians (Yuengert 1989). In general, most comparisons of native and immigrant earnings in the literature ignore the sample selection bias due to excluding self-employed and nonworkers. Adjustment for this source of sample selection bias is expected to improve the relative earnings of immigrants and increase immigrant earnings for those who have had more time in the U.S. to assimilate. How this self-employment bias might have changed from 1940 to 1990 is not well documented, but warrants more research.

A final source of bias in following the assimilation of an immigrant cohort over time after it has arrived in the United States is return migration or emigration. Those returning may be either the more successful immigrants with relatively high earnings or the less successful immigrants with relatively low earnings. Consequently, the uncertainty surrounding assimilation estimates increases with duration of U.S. residence and growth in return migration. As the size of an entering cohort of immigrants is observed to decline from one Census to the next, and this decline is faster than can be explained by mortality, this cohort attrition can be attributed either to return migration or to a tendency for persons to increase their underreporting of immigrant status with duration of residence. A statistical explanation is needed for how this form of cohort attrition varies across Censuses, by country of origin, by education, and by sex. Until we have better data on emigra-

tion from the United States by birth origin and date of entry into the United States, the existing data will have difficulty clarifying these various life-cycle processes that could substantially affect immigrant/native comparisons of earnings or what is reported as the rate of assimilation of immigrant cohorts. This is a second source of bias in assimilation estimates that requires more study.

Immigrant hourly earnings of men who had arrived in the five years before the 1940 Census are 1 percent more than the earnings of natives age twenty-five to forty-four in the 1940 Census. The analogous immigrants in 1980 reported wages 26 percent below this native-born American comparison group in the 1980 Census (Borjas 1992). As with the education trends, much of this pattern can be related to the shift in composition of immigrants by origin country, from Europe to Asia and Latin America. Since 1980, the wage structure in the United States has shifted markedly against the least educated workers, increasing the wage premium paid for workers with a college education. The proportion of immigrant cohorts in 1970 and 1980 with twelve or fewer years of schooling is greater than for the native population, and it comes as no surprise that these immigrants are disproportionately from Latin America. Wages declined for these less educated immigrants during the 1980s as they did for equally educated native-born Americans (LaLonde & Topel 1992).

After the 1980 Census, it is possible to trace changes in the education and earnings of immigrants relative to natives in the immigrant supplements to the monthly Current Population Surveys [CPS] in 1979, 1983, 1986, and 1989. These data are analyzed by Funkhouser and Trejo (1993). From the early 1980s to 1987-1989, the average educational attainment and hourly earnings of immigrants improved relative to native males age eighteen to sixty-one, reversing the downward trend of earlier decades. Funkhouser and Trejo also note an increase in the share of immigrants coming from Europe and from some areas of Asia during the 1980s. The proportion of less-educated immigrants continued to increase in the 1980s, but these increases were only among those coming from Hispanic areas other than Mexico. It may be argued that because of its more detailed income questions and better-trained enumerators, the CPS elicits more accurate information on hourly earnings than does the Decennial Census. If the CPS is a more precise source of data on earnings than the Census, future comparisons of the earnings of immigrants and natives should rely more extensively on

analyses of the CPS files. One hypothesis offered by Funkhouser and Trejo for the upsurge in better-educated European and Asian immigrants in the 1980s is the previously noted increase in the relative wage premia offered to highly educated workers in the U.S. labor market (Murphy & Welch 1992). They conclude that the Immigration Reform and Control Act of 1986 is not the primary cause for this improvement in the quality of immigrant cohorts during the 1980s because the change in composition begins before this act was passed and is evident in regions that are not the primary concern of the legislation.

The basic regularity first noted by Chiswick (1978), and then replicated in many settings around the world, is that immigrants increase their earnings more rapidly than natives after their arrival in a destination. Chiswick noted that after a decade, the earnings of immigrants to the United States had roughly caught up to those of natives, and thereafter immigrants tend on average to outperform natives. Different groups, however, experienced very different earnings profiles relative to natives depending on their self-selection, their match of skills relevant to the U.S. labor market, and their likelihood of becoming a return migrant (Jasso & Rosenzweig 1986). Borjas (1985) found that later cohorts of immigrants caught up to the earnings of natives more slowly than Chiswick estimated and attributed this to a lower "quality" of subsequent immigrant cohorts. This slower assimilation of later cohorts of immigrants can also be associated with the shifting composition of immigrant origins. Borjas' (1987) analysis was designed to deal with the self-selection of emigration, but excluded many origin countries from which two-thirds of the foreign born who entered the United States from 1975 and 1980 came and did not include literacy, which is widely associated with migration (Schultz 1982) among the conditioning variables. Jasso and Rosenzweig (1990a) show, based on a much larger sample of immigrants and countries of origin, that when these omissions are corrected, a pattern of positive self-selection of the emigrants emerges more strongly than in Borjas' (1987) study. If the estimates of Jasso and Rosenzweig are accepted, then part of the lower level of "assimilation" of later cohorts of immigrants to the United States might be due to the increased rate of positively selected emigration.

By the very nature of the distinction between legal and illegal immigrants, representative data that describe these two groups are scarce. In practice, most studies of the education and earnings of immigrants and natives simply combine le-

gal and illegal immigrants along with refugees. Only a few investigations actually use records of legal immigrant cohorts from the INS in combination with other representative surveys and censuses to trace the assimilation of legal immigrants (e.g., Jasso & Rosenzweig 1986).

The Social Costs of Legal and Illegal Immigration

Despite the convincing evidence that immigrants are productive after arriving in the United States and that their earnings converge with duration of residence here toward the earnings level of natives with the same education, do the migrants nevertheless impose social costs on native Americans? These social costs could be of two types. Do they consume more services from the public sector than they pay for in taxes? And, do they reduce the employment and wage opportunities and amenities for some native-born Americans? First it should be clear that illegal immigrants are not eligible for federal welfare and income transfer programs in the United States as they are in some European countries. Even legal immigrants cannot apply for welfare for their first five years in the United States or they risk deportation. Only refugees are eligible for welfare programs and, indeed, have been the beneficiaries of other special programs designed to assist them in their resettlement.

Given the previously documented decline in the education and earnings of immigrants relative to natives from 1940 to 1980, it is not unexpected that immigrants in the 1950s, 1960s, and 1970s were less likely than natives to draw upon the welfare system (Tienda & Jensen 1986; Simon 1989), but that this pattern appears to have reversed by the 1990s (Borjas 1994). In the earlier Censuses, the welfare participation rate of immigrants rises with the duration of residence in the United States, either due to the satisfaction of eligibility requirements or because immigrants were converging toward the behavior of other Americans in their willingness to depend on welfare. There is much greater welfare participation among refugees than among nonrefugee immigrants, as we might expect from the intent of legislation. Even after twenty years in the United States, 14 percent of refugees arriving in 1965-1969 are still on welfare, according to the 1990 Census, compared with 7.4 percent of all native households (Borjas 1994, Tables 1 and 3).

The accounting exercises that are offered in the literature to represent the taxes paid and benefits received by immigrants are difficult to evaluate and reflect widely varying assumptions (Fix & Passel 1994). Figures suggest that the balance is less favorable for the native taxpayer in 1990 than it was in 1950, when immigrants came predominantly from Europe and had a higher educational attainment than native-born Americans. There are also factors working in the opposite direction. If many immigrants return to their origin country after a period of residence in the United States, it is likely that they do not recoup their contributions to the social security trust fund.

For young immigrants other than refugees, the taxes they pay probably roughly equal the discounted value of the benefits they receive. Moreover, many of these benefits are designed to improve the health and future productivity of the children of immigrants. This is a social investment the United States may want to make. Such generational accounts are less rewarding in the case of immigrants who enter the United States toward the end of their productive careers, many of whom enter under an immigration visa provision justified for family reunification. For this older group, five years of residence in the United States may qualify them to apply for a retirement pension under Supplemental Disability Insurance, which is funded from Social Security, and then secure Medicare coverage. In such cases, taxpayers are subsidizing family reunification of elderly immigrants to a substantial extent, and the transfer of public funds is not justifiable as an investment in the future productivity of Americans.

In addition to any net drain on (or contribution to) public resources that immigrants may impose on (make to) native-born Americans, the immigrant worker may depress the wage rate available to natives who seek work in similar activities. Alternatively, immigrant labor may raise the returns on physical capital and complement the returns to certain other groups of native workers who occupy different types of jobs than do immigrants. Many studies have sought to estimate how the concentration of immigrants in a local labor market affects the wage in that market for native workers. Most studies that are able to find such an immigrant cross-wage effect on native workers find the effect to be negligibly small (OECD 1993; Fix & Passel 1994; Zimmermann 1994). However, migrants do substitute for themselves in the sense that they lower the wages that other migrants receive on average in a regional labor market. But few studies find much evidence that immigrants substitute for any distinguishable group of native workers, except per-

haps among unskilled workers during periods of recession (Card 1990; LaLonde & Topel 1992; Altonji & Card 1991; Fix & Passel 1994). It has long been hypothesized that unskilled labor could be a complement for more skilled or educated labor. Evidence of this pattern is found with regard to unskilled immigrant labor by Gang and Rivera-Batiz (1993), who estimate that a 1 percent increase in unskilled labor due to immigration raises the returns to education by three-fourths of a percentage point. If the wages of domestic labor are inflexible, immigration might be expected to lead to higher unemployment rates or lower labor force participation rates among native workers. But neither has been found. A concentration of immigrants in the labor force is associated with an increase in the proportion of the population in the labor force (Altonji & Card 1991). One effect of a concentration of immigrant workers in a region of the United States is an increase in the outmigration from that region of native workers to other parts of the U.S. labor market. Thus, the mobility of native workers may dilute the wage-depressing effect one might expect to find among less-skilled native workers in regions such as Texas, California, or Florida with a large proportion of immigrant workers.

To complete the range of possible effects of immigration, the timing of immigration and the choice of destination (even by refugees) are likely to be responsive to economic conditions in the host country and the alternative labor markets within that country. This is more obvious in the European context where an individual on leaving one country then has a choice of destinations among others countries, and the net flow of immigrants is sensitive to where the best opportunities are to be found (Zimmermann 1994). The composition of migration may also change according to changes in the structure of wages in different destinations (Funkhouser & Trejo 1993). If immigrants decide to locate in relatively high local labor markets in the United States, it is not surprising that the local concentration of immigrants is not strongly (inversely) correlated with wage outcomes for natives or for immigrants.

The unresolved problem with virtually all empirical studies of the labor market consequences of immigration is that they examine the correlation between the number or share of immigrants in local labor markets and other employment or wage outcomes in those markets. This approach is valid only if the allocation of immigrants across local labor markets is random and no other compensating adjustments occur. These adjustments might take the form of outmigration of natives, as noted earlier, or changes in local prices, such as increases

in housing costs or in congestion costs of using public services (e.g., schooling), (Sala-i-Martin 1994) or in decreases in the prices of services, such as child care, that immigrants are likely to provide. In the longer run, any changes in local wages and prices would be expected to give rise to movements in capital as well as further migration of labor.

To analyze correctly the consequences of immigration requires the economist to devise a way to identify the distinguishable effects of shifts in the derived demand for labor from the effects of exogenous shifts in the supply and regional allocation of immigrant labor. I have not found any satisfactory analysis of the consequences of immigration that provides a basis for empirically identifying these general equilibrium effects. For example, Card's (1990) study of the Mariel Boatlift exploits this exogenous event to trigger a supply shift of immigrant labor and thus focuses attention on a natural experiment. But immigrants (and natives) nonetheless choose where to settle, and these simultaneous decisions are unavoidably contaminated by their responsiveness to regional demand factors. Research in this area has concluded that immigration has no major effects on local labor market outcomes. This finding, however, is fragile because the analytical methods used in these studies do not provide convincing empirical evidence on the difficult central question.

Policy Choices

First, how should the United States determine the aggregate flow of immigrants? Second, how should this flow be allocated? Third, what resources should be expended to curb illegal immigration?

Political pressures restrict migration, especially during recessions when domestic levels of unemployment are relatively high and real wages are not likely to be rising. For this reason it might be reasonable to have the quota of immigration legislated to vary pro-cyclically with the business cycle, and thereby dampen cyclical movements in unemployment and wages. The share of the immigration quota provided for the purposes of family reunification in the United States appears to be high compared with other industrially advanced countries (OECD 1993). However, countries that have relied more heavily on skill-based admissions of immigrants, such as Canada, do not appear to have obtained a very different mix of immigrants than the United States. If immigration visas are awarded to applicants with skills that are designated to be scarce, annual calculations based on the wage

premia for each skill group in the Current Population Survey could be used to determine such "scarce skills." This mechanism should moderate the increasing spread of wages between education and skill groups that has occurred in the United States since 1980 (Murphy & Welch 1992). This fine-tuning of the composition of immigration would remove this issue from perennial political debates and might mitigate somewhat the growing income inequality that faces the U.S. society.

There will continue to be excess demand for immigration to the United States, even if Latin American growth in the 1990s returns to the respectable pace of the 1960s or 1970s. Resources should be appropriated to interdict illegal immigrants only to the extent that these resources can be shown to be effective. There is always an alternative approach, one that fosters further liberalization in the world trading economy. Strengthening the institutions that promote freer international trade in commodities and enhance long-term capital mobility may help to absorb the excess demand for immigrating to the United States, while also increasing world output.

Summary

The educational attainment of cohorts of immigrants to the United States has increased over time from 1940 to 1980. But that increase has not been as rapid as that among native-born Americans. Consequently, the difference in average years of education between natives and immigrants increased. This trend appears to have reversed in the mid 1980s according to the CPS data analyzed by Funkhouser and Trejo (1993), with a resurgence in immigration from Europe. It will be important to document if this improving trend in educational attainment of immigrants relative to natives continued up to the 1990 Census and into the 1990s.

Some part of the decline from 1950 to 1980 in immigrant-native relative education is probably due to the growth in the share of illegal immigration in total immigration. But without better data on who is a legal and illegal immigrant, this conclusion about the consequences of illegal immigration must remain tentative. The decrease in average education of the immigrant population entering the Uni-ted States compared with the native population is probably less important than the growing heterogeneity of immigrants, with

a substantial inflow of immigrants who are both relatively well-educated (beyond college) and poorly-educated (less than high school). The former group presents few special problems for assimilation, whereas the latter may present a special challenge.

Comparisons of the earnings of immigrants and natives are subject to several additional sources of uncertainty and probable bias that cloud the adequacies of cohort assimilation comparisons. Because earnings are only observed for a possibly unrepresentative sample of wage earners, the comparisons reported in the literature that show earnings of recent immigrants falling relative to those of natives may be biased. It is my opinion that the omission of self-employed probably understates the earnings capacity of immigrants relative to natives, and this understatement might increase with duration of residence in the United States, underestimating the rate of assimilation of immigrant cohorts in recent decades.

A second source of bias is caused by return migrants. Lacking direct data on emigrants from the United States according to when they first immigrated to the United States and from where they came, it is difficult to adjust the comparisons of immigrant cohorts and natives for these self-selected return migrants who have left the cohort between one census and the next census enumeration. If the return migrants are positively selected, as some studies suggest, then the immigrant cohort's earnings comparisons over time are biased downward, and the true rate of assimilation of immigrants is more rapid than our estimates have indicated.

The evidence of the effects of immigrants on natives is not compelling. Estimates of what immigrants consume in the way of public services appear roughly to balance their tax payments. Many of these public services involve investments in the health and schooling of the children of immigrants that the society should encourage. However, the taxes immigrants pay flow primarily to the federal government while the benefits are often funded at the local and state government levels, creating hardships that the federal system should explicitly address.

Many studies have not been able to find evidence that a concentration of immigrants in a local labor market depresses employment or wage opportunities for local groups of native-born Americans. But these studies do not confront adequately the problem of separating the consequences of the immigrant supply from the local labor market demand con-

ditions that probably contributed to where the immigrants settled. Among the outcomes that need to be evaluated are, in addition to wages and employment, the resulting changes in various prices and capital movements. This is a major challenge to imbed the immigration issue within a general equilibrium model of regional growth that can be estimated directly from data on multiple regional economies within the United States over time.

Unskilled Americans, who have seen their job prospects erode since 1980 and their real wages fall, have an understandable concern that the government should protect their livelihoods. But immigration does not appear to be a large part of this broad national problem of a growing imbalance between our educational system and the skills it provides to our workforce and the demands of the economy for more highly skilled, better educated workers. Dealing with this more fundamental problem requires more innovative educational and social programs. Building barriers to immigration would not seem to be justified by current research, although raising the skill composition of immigrants could make a minor contribution to reducing wage inequality and improving job prospects for the least skilled and educated native-born American workers who have recently lost much ground.

INTRODUCTION

The development of American immigration and refugee policies and procedures in the twentieth century has been characterized by *ad hoc* administrative measures and incremental legislative steps. Thus, when faced with the new and unexpected situation of a direct influx of large numbers of Cubans, Haitians, and Central Americans during the 1980s, legislation, administrative procedures, and contingency planning based on the previous crisis were overcome by events. Based on lessons from the U.S. experience in this period, this paper sheds light on policy development, legal statuses available for immigration emergencies, resettlement management, and return programs. The experiences in 1980 regarding Cuban and Haitian entrants and in 1988-89 regarding Central Americans are used to illustrate these points.

A selected list of legal, logistical, institutional, and financial systems or remedies that may play a role during an immigration emergency should help structure a discussion of policy options. This paper attempts to review various aspects of preparedness, institutional responses, long-term adjustments, and special cases that must be considered in addressing immigration emergencies. In discussing these components of the Cuban-Haitian crisis and the Central American influx, the paper focuses on:

- Expectations on the eve of the Cuban-Haitian crisis in 1980 and in relation to the expansion of direct migration from Central America to the U.S. in the ensuing years;
- Results and impact of such expectations on existing procedures;
- Legislative and administrative changes instituted during that period;
- Lessons that can be distilled from the U.S. experience with immigration emergencies in the 1980s.

Defining an Immigration Emergency

At the outset, it may be useful to look at different definitions of an immigration emergency for which extraordinary policies and procedures must be developed. The Federal Emergency Management Agency [FEMA], which was called into action to manage the Marel crisis in 1980, is normally expected to follow specific procedures to define the kinds of emergencies in which it takes responsibility:

State disaster officials request Preliminary Damage Assessments [PDAs]; state governors ask the President to declare a major disaster when supplemental federal assistance is required; FEMA evaluates PDAs and advises the President, not on the basis of the numbers affected, nor on the basis of cost estimates (which are considered unreliable), but rather on the basis of uninsured needs not met by state, local, and voluntary recovery efforts.

This formulation of criteria and procedures was intended for a recovery effort following a discrete event, like a hurricane or earthquake, not for the management of influxes of large numbers of people, where the crises might be ongoing, nor for a crisis with legal and international repercussions. However, the FEMA focus on local needs, its immediate access to funding, and its "mission assignment" capability to call upon seventeen other agencies and departments of the federal government to detail personnel to assist in an emergency, made it a very useful—and perhaps the essential institution at the time—to spearhead efforts to manage the Mariel crisis.

A report of the Cuban-Haitian Task Force [CHTF], looking back at its experience in 1980, suggested a simpler definition of an immigration emergency: "a future possible influx of persons . . . who will require large-scale social services." Another definition from the time was an influx of unpredictable numbers and of unpredictable duration.

In legislating procedures for use of the newly created Department of Justice Immigration Emergency Fund in 1990, the Congress left it to the Attorney General to prescribe scenarios that constituted an immigration emergency. The INS Proposed Rule on the Immigration Emergency Fund (Nov. 5, 1993) established procedures governing requests for a Presidential declaration of an immigration emergency, but again did not provide a clear definition. In addition, the Attorney General was given authority to provide for local assistance up to $20 million of the $35 million fund even in the absence of an emergency where (a) more than 1000 asylum applicants arrived in one quarter of a year and (b) there was danger to lives, property, safety, or welfare of residents.

The definition of a refugee or migration emergency meant to trigger funding from the Emergency Refugee and Migration Assistance fund [ERMA] of the Department of State is a Presidential designation of an "unexpected, unforeseen refugee or migration emergency" which is deemed to be in the national interest. "Unfore-

seen" is defined as "not predictable enough to seek an appropriation from Congress in advance." The criteria that trigger the use of ERMA are, thus, lack of funds in the budget and no reprogrammable funds. The Department of State has reserved use of the fund since 1980 for overseas emergencies, not domestic border crises.

These definitions of an emergency significantly are largely objectively quantifiable and expected to trigger certain responses. Different agencies and departments of government use different definitions depending on the response that they are capable of making and the policy and tradition they bring to it. INS, for example, operates from a definition focused almost entirely on the difficulties of processing and control, the hardship an influx of migrants might bring to American residents, and the question of legal status—in other words, a border enforcement point of view.

FEMA looks at local crisis management issues: recovery needs requiring resources beyond the capacity of the local community. The CHTF, in the period that it was becoming more attached to the Department of Health and Human Services [HHS] Office of Refugee Resettlement [ORR], was more concerned with the well-being of the migrants themselves and of their social service needs. The Department of State, under the authority of the President, looks at unanticipated costs and "the national interest," objective and subjective criteria that are motivated by foreign policy rather than by domestic concerns and that focus on emergencies in other countries.

In this paper, preparedness for the immigration emergencies of the 1980s is evaluated by the extent to which expectations were closely related to the realities of history and current conditions, the accuracy and timeliness of information reaching an appropriate level to trigger action, and the degree to which contingency planning was in line with national laws and values and coordinated in a manner to ensure uniform compliance and cooperation among the relevant federal and state agencies and departments and local voluntary groups.

THE 1980 CUBAN-HAITIAN IMMIGRATION EMERGENCY

Federal Expectations, Information, and Preparedness

Despite some obvious indicators that things were changing, the nation on the eve of the Mariel crisis did not consider itself a country of first asylum for refugees. President Carter said, on May 14, 1980, in the middle of the crisis, "Our laws never contemplated and do not adequately provide for people coming to our shores directly for asylum . . ." It was anticipated that traditional U.S. generosity to those fleeing political persecution could be exercised in a deliberate, orderly, and planned migration and resettlement program.

The model of an orderly and internationalized resettlement program so recently in the national consciousness was the U.S. response to the Vietnamese boat people landing in Thailand, Malaysia, Indonesia, and the Philippines. Except for the initial exodus from Vietnam in 1975, when refugees stayed briefly at reception centers on the West Coast of the United States and four military camps around the U.S. while awaiting transfer to sponsors or relatives, refugees were selected and processed in holding camps abroad and brought to the U.S. only when they could be delivered directly to sponsoring families or voluntary organizations. Boat people did not land on U.S. beaches; that kind of chaos and tragedy was not expected here. The U.S. had the luxury of time and planning in the selection and resettlement program.

Further, following the Geneva Conference on the boat people situation in Southeast Asia in the summer of 1979, the U.S. was one of a number of countries that pledged resettlement numbers, and although the U.S. pledged the most numbers of any single country (14,000 a month), there was a sense of joint responsibility in the internationalized program.

The U.S. had experienced its most massive and long-lasting refugee resettlement program in the Cuban Refugee Program, which had lasted for nearly fifteen years from 1959 to 1973. This program, established by the Attorney General's parole authority and then through special legislation and outside the usual immigrant visa quotas, brought 800,000 Cubans to the U.S. In the earliest period, Cuban

exiles arrived by air, through various visa arrangements, or on their own cognizance without special assistance. After suspension of commercial air travel from 1962 to 1965, when U.S.-Cuban relations were at their lowest point, Fidel Castro suddenly opened the port of Camarioca for one month in 1965. Just as they were to do fifteen years later, Cuban-Americans plied the straits in small boats to rescue some 5,000 family members until President Johnson formalized an "air bridge" orderly migration program (the "Freedom Flights") that was to bring 50,000 Cubans a year to the U.S. for the next eight years. While arrivals had essentially stopped in 1973 when Castro brought that program to an end, a plan for phasing out the last Cuban refugee resettlement services over a period of six years was entering its third year when the Mariel crisis occurred.

The Refugee Act of 1980

Congress and the federal government had been working together in the years preceding 1980 to establish for the first time permanent statutory authority for the acceptance and resettlement of refugees in such orderly migration programs. The Refugee Act of 1980, signed into law March 17, 1980, which amended the Immigration and Nationality Act of 1965 to bring it in line with current practices and international norms of refugee assistance, was intended to put into place a contingency plan and procedures that would be sufficiently flexible to be responsive to unforeseen emergency refugee situations.

During the previous thirty years, refugees had been resettled in the U.S. on the basis of group designations in each overseas emergency under the parole authority of the Attorney General, with a presumption in favor of those fleeing communist countries. Resettlement assistance and adjustment of status to permanent resident had been made available through country-specific legislation on a case-by-case basis.

Due to Congressional dissatisfaction with the *ad hoc* legislative and administrative practices, the 1980 law for the first time incorporated into U.S. law the international legal definition of a "refugee" according to the Geneva Convention of 1951, without the ideological baggage of the Cold War. [See **Appendix** for full definition.] With the intention of using the services of the U.N. High Commissioner for Refugees [UNHCR] in the country of first asylum abroad for protection and designation of those refugees requiring resettlement, the act provided procedures for selection and processing on an indi-

vidual basis of those refugees whose admission to the U.S. is "justified by humanitarian concerns . . . or is otherwise in the national interest." For the first three years that the legislation was in force, a "normal flow" of refugees up to 50,000 could be admitted to the U.S. annually. The President was to consult with Congress annually concerning planned admissions in excess of that number and immediately in case of an unforeseen emergency refugee situation. Proposed Admissions for FY 1980 started at a high of 217,000 because of current concerns for Indochinese "boat people" and Soviet Jews.

Provision was made for the coordination of this complex program through the newly-created office of the U.S. Coordinator for Refugees, an Ambassador-at-large under the authority of the Secretary of State. At the same time, legal status determinations for resettlement of refugees were to be carried out under the authority of the Attorney General, as delegated to the Immigration and Naturalization Service [INS].

The 1980 legislation also created the Office of Refugee Resettlement in the Department of Health and Human Services under the general policy guidance of the U.S. Coordinator to fund and carry out programs for domestic resettlement of, and assistance to, refugees. Such programs were to include employment training and placement, English language training, cash assistance as well as supplemental security income benefits [SSI], and response to such special needs as health, social services, and care for unaccompanied refugee children. Services were to be subcontracted largely to voluntary resettlement assistance agencies or to be 100 percent reimbursable by the federal government to the states.

With the passage of a systematic program for all refugees, the Indochina Migration and Refugee Assistance Act of 1975, one of the pieces of special legislation still on the books from the earlier era, was repealed. However, while the assistance program for earlier Cuban refugees was being phased out, the new legislation did not repeal the special legislation for Cubans, but merely amended the Cuban Adjustment Act of 1966 to conform with the one-year adjustment provisions of the new refugee act. The 1966 act and its potential for future use in adjusting the status of Cuban entrants to permanent residency was not a matter of discussion in the Conference Committee concluding negotiations on the new legislation.

The criterion for acceptance as a refugee—a well-founded fear of persecution in the home country for various reasons—was

established as the basis for adjudicating asylum applications for individuals *after* their entry into the U.S. as well. The Refugee Act of 1980 went further than the U.N. in allowing for the designation as refugees of certain persons still in their own country in certain circumstances, thus allowing for in-country processing and orderly movements of would-be refugees when the exit of politically sensitive people and family members could be negotiated in preference to imprisonment and persecution. This important provision was useful in the following years in setting up the Overseas Departure Program from Vietnam, Moscow processing of Soviet Jews, and the processing and movement of selected refugees directly from such Western Hemisphere countries as Cuba, El Salvador, Haiti, and Nicaragua.

The new Act did not, however, anticipate in any manner a direct influx of large numbers of people in little boats arriving on U.S. beaches and applying for asylum. In designating the number of asylees who could adjust their status to permanent resident under the new legislative authority, the Congress anticipated the possibility of only 5,000 *bona fide* asylees being accepted for adjusted status in FY 1980 from among aliens already in this country.

Camarioca: The Cuban Precedent, the Cuban Presentiment?

The incident at the port of Camarioca clearly had been forgotten by Congress and the Administration in Washington. However, when Castro brought the air bridge program to an end in 1973, some 135,000 approved refugees had been left behind. The flow of migrants from Cuba to the U.S. was at its lowest point during the period from 1973 to 1978. Only 18,000 people successfully made the trip through third countries or by entering the U.S. illegally.

With the beginnings of a thaw in U.S.-Cuban relations in 1978, "Interest Sections" were opened in each nation's capital to conduct diplomatic business, and between October 1978 and March 1980, a total of 22,168 former political prisoners and their families were allowed to migrate from Cuba to the U.S. Negotiations aimed at easing relations with Cuba in the fall of 1979 included discussions about expansion of this program to a possible larger orderly migration program. Economic conditions in Cuba had declined, the desire to emigrate had been whetted by visits now permitted from exile relatives, and Castro was eager to export those most likely to foment dissent in Cuba.

Later in 1980, the House Permanent Select Committee on Intelligence was to accuse the Carter Administration of an intelligence failure due, in part, to Castro's March 8, 1980 speech intimating that a repeat of Camarioca could occur if negotiations broke down. The Department of State, however, believed "that the reopening of Camarioca did not seem imminent," and instructed the Interests Section to brief Cuban officials on the Refugee Act of 1980, which, they believed, would provide for the more rapid processing that the Cuban Government was seeking. [See Copeland, R. 1981. The 1980 Cuban Crisis: Some Observations. *Journal of Refugee Resettlement* (August).]

Whether this was an intelligence failure or failure to act on intelligence received is not clear, but it is clear that no one in authority recognized that a crisis was imminent. Significantly, however, at that time the President was deeply distracted by the Iran hostage crisis and the deteriorating U.S. economy. No early warning system can be effective if those in charge are not in a position to pay attention and act on the warning.

Growing Numbers of Haitian Arrivals

If the arrival in south Florida from 1973 on of Haitians in small boats was noted outside the local community, it was in the courts where Haitian rights activists were fighting for fair hearings for Haitian asylum applicants. The small group of Haitians was being managed not through the generous refugee and asylum procedures offered to those fleeing communist countries but, rather, through the border enforcement procedures of the INS applied in an inconsistent, *ad hoc* manner. Until 1977, a year when only 274 Haitians had been apprehended entering the U.S., the INS had detained Haitians until deportation hearings.

In 1977, appeals from Haitian rights advocates bore fruit; the INS reversed course and released imprisoned Haitians without bond, giving them work authorization while they were awaiting asylum and deportation hearings. The new policy and procedures, along with a tightening up in official policy in the Bahamas (where Haitians had also sought asylum), caused an increase in the flow of Haitian boat people to the U.S. from 274 in 1977 to 1,815 in 1978, a growing backlog of cases at INS offices, and strain on local social and health care services. There was a backlog of some 20,000 asylum applicants from all sources by fall 1979.

In response, the INS again reversed course in 1978, reinstituting detention, cancelling

work authorization, and setting up an expedited deportation hearing process with little representation available for the Haitian asylum applicant. U.S. Federal District Judge James King imposed a temporary injunction against the INS to suspend this practice in July of 1979 and ruled in July 1980 that, "The decision was made among high INS officials [note: *only* INS officials are mentioned] to expel Haitians, despite whatever claims to asylum individual Haitians might have. . . . This program, in its planning and executing, is offensive to every notion of constitutional due process and equal protection."

At the time of the onset of the Mariel crisis in April, 1980, the INS was still in limbo as to how it would be permitted to respond to the growing Haitian influx, which had increased by 2,522 additional arrivals in 1979 and already surpassed that number in the first three and one-half months of 1980.

Occupation of the Peruvian Embassy: An International Crisis

A number of fast moving situations thereafter were beyond American control. When on March 28 a busload of Cubans seeking political asylum crashed through the gates into the Peruvian embassy compound in Havana killing a Cuban guard in the shooting that followed, Castro, in an effort to embarrass the Peruvians, announced that those seeking to leave Cuba would be allowed to do so. The antagonism toward Peru and a number of other Latin American governments had come about because they had been offering Cubans political asylum if they came to the embassies, but had not been willing to move ahead with an orderly migration program with the Castro government (contrary to the procedures preferred by the U.S.).

As the number of Cubans massed at the Peruvian Embassy in Havana in increasingly inhumane and untenable living conditions grew to more than 10,000, the government of Peru, supported by Venezuela, Costa Rica, and the United States, requested assistance of the Intergovernmental Committee for European Migration [ICEM][1] for an internationalized resettlement effort. Responding to the appeal from ICEM for resettlement numbers from

[1] ICEM underwent two name changes in the 1980s, first dropping "European" from its name to become the Intergovernmental Committee for Migration [ICM] reflecting its growing international responsibilities, and later being renamed the International Organization for Migration [IOM]. This paper uses the name or initials in effect at the time of the events discussed.

governments around the world, the U.S. offered to resettle 3,500 Cuban refugees, the largest number offered by any of the participating countries. The other quotas established by April 30 were Argentina 300, Australia 200, Austria 50, Canada 300, Costa Rica 300, Ecuador 200, Federal Republic of Germany 278, Peru 1,000, Spain 500, and Venezuela 500. In addition, financial contributions of some $768,000 for the resettlement program, plus unspecified additional transportation costs, were pledged by the U.S. and by the countries where quotas were established.

Costa Rica, with ICEM assistance, agreed to provide a staging area for prescreening and transit for the Cubans. With the acquiescence of the Cuban government, ICEM initiated an airlift from Cuba to Costa Rica and onward to the other countries on April 16, 1980. On April 18, with only 677 Cubans transported, Castro precipitously cut off the flights to Costa Rica and within three days opened the Port of Mariel to all those wishing to leave. (There was one more flight on April 24, bringing the total airlifted to San Jose to 773. Another 484 persons were able to go to Spain on direct commercial flights from Havana, and ICEM arranged transit flights from San Jose for 387 for resettlement in Peru by May 15.)[2]

Castro was reacting to an international public relations disaster and an internal economic crisis. The question arises whether at this point the U.S. could have done anything within its humanitarian tradition without threatening either other foreign policy initiatives to forestall the measures Castro took to take the heat off his government or the overwhelming response of Cuban-Americans in Florida who went out in their boats to bring their relatives and friends over. Castro's goal was to embarrass the U.S. and other countries that were gaining political mileage at Castro's expense through the international resettlement program. By mixing undesirable criminals or individuals released from mental hospitals with the dissidents and family reunification cases, and by overwhelming the State of Florida, Castro succeeded. For months to come, despite two international conferences in San Jose, Costa Rica, Castro would be re-

[2] Different sources quote different numbers of Cubans moved from Havana in the airlift. This paper relies on the statistics issued by ICEM at the time of the airlift. Discrepancies—for example, much higher figures in the *Report of the Cuban-Haitian Task Force*, November 1980—may be due to the inclusion of numbers of released Cuban political prisoners who had left Havana earlier in 1980 and were not actually occupants of the Peruvian Embassy compound or part of the ICEM airlift.

sponsive neither to further calls for an orderly migration program nor calls for adherence to the norms of international law and customary international courtesies.

Under such circumstances, the contingency plans laid out in the Refugee Act of 1980, starting with the internationalization of the resettlement effort, had questionable efficacy. The Act did not anticipate the use of refugees as a weapon by one country against another, much less the mockery of a generous refugee policy through imposition of "undesirables"—criminals and the mentally ill—on the recipient country.

The Post-Mariel Limits of Internationalization

Just as the Refugee Act of 1980 did not anticipate large numbers of refugees or asylum-seekers landing directly on the U.S. shores, so it did not anticipate that the prevailing international attitude in such a circumstance would be that this was now an American problem and no major international effort was required. UNHCR and a number of European governments were extremely reluctant to make an all-out effort toward internationalizing the resettlement program once the Cubans were in a country that, more than any other country in the world, seemed fully capable of providing adequate first asylum and resettlement and was obviously the destination of choice.

The UNHCR also had not been able to respond positively to requests from Latin American countries to assist with the asylum seekers in the Peruvian Embassy compound in Havana, at least in part because by the narrow Geneva Convention definition of refugee (as opposed to the expanded designation allowed by U.S. law) these people had not yet left their country of origin. At that time and in this particular crisis, the U.S. Department of State was involved in an effort to urge the UNHCR toward a broader commitment and interpretation of its mandate, but without immediate success.[3] On the basis of appeals from major donors, the UNHCR did agree to provide limited funds for care and maintenance of the Cubans in transit in Costa Rica. Questioned on the eligibility of Cubans for refugee status and resettlement assistance under the UNHCR mandate, a spokesman

[3] The UNHCR has since that time interpreted its mission more broadly to include peoples displaced or threatened within their own countries who require protection and/or resettlement, e.g., the Kurds in Iraq following the Gulf war and the Bosnians in war-torn former Yugoslavia.

replied as late as April 25, 1980, that UNHCR would pay its share in the cost of a humanitarian operation in Costa Rica and Peru and that the question of eligibility would eventually be studied by UNHCR later when migrants had arrived in countries of resettlement. No funding for Cubans resettled in the U.S. was ever made available by the UNHCR.

ICEM had the more flexible mandate to assist refugees *and migrants* without definition at the request of its member governments through fully reimbursable programs rather than through annual grants to a general fund. Thus, ICEM was able to provide processing and transportation assistance from Havana to Costa Rica and later was to take responsibility for outprocessing and transportation to U.S. sponsors from each of the U.S. holding camps on contract with the U.S. "In these circumstances," the U.S. Coordinator for Refugees, Ambassador Victor Palmieri, stated, "an organization like ICEM is . . . indispensable. It is an organization that we have found in Indochina, in our operations with the Soviet Jews and Eastern Europeans in Vienna and Rome, and now with our Cubans to be flexible, responsive and cost effective. Indeed, it is an organization which, if it did not exist, we would have to have invented . . ."

While the U.S. leaned heavily on ICEM for specific logistical services, the agency of choice for internationally accepted refugee protection and advocacy was the UNHCR, and the U.S. expected some benefits at the time of its national crisis in return for its large financial commitments to the UNHCR. After further negotiations the UNHCR did eventually take over from ICEM the limited screening and interviewing of Cubans for third- country resettlement from U.S. holding camps, but once the Cubans were in the U.S. only a few hundred were ever successfully resettled elsewhere, despite the pledged resettlement numbers. Those who had been taken initially to Peru did not become permanently resettled for some time, some eventually making their way to the U.S. after a considerable period of discontent.

Failed Expectations

The image on television of chaos and of criminals and mental patients being imposed on the "freedom flotilla" led to a turning point in American attitudes, even though the actual number of excludable undesirables may have been only a few thousand out of more than 124,000 Cubans who came. The prevailing attitude of generosity to refugees among the pub-

lic and in the Carter Administration was overtaken by a feeling of insecurity and lack of control at the borders as well as weakness at being the fall guy for Castro's dirty tricks. The imperfect coordination of refugee and asylum procedures and the inconsistency of U.S. Administration policies from one bureaucracy to another within the federal government also were revealed when the boat arrivals of Cubans and of Haitians were inevitably linked. In the aftermath, the mood of the country toward refugees turned from sympathy to anxiety, and Members of Congress and professionals in the field of assistance to migrants and refugees spoke of "compassion fatigue."

In summary, in April 1980, when the Cubans began to arrive, neither refugee resettlement policy and procedures administrated by the office of the U.S. Coordinator for Refugees and the Department of State's new Refugee Programs Bureau, nor immigration policies and procedures and border enforcement administrated by INS provided any guidance for immediate action at the federal level. Controversy occurred as well over the mandates and responsibilities of international organizations. Expectations were not in line with historic reality and current conditions, and available information or "early warnings" were ignored.

A number of critics have pointed to a double standard at work in the operation of U.S. immigration, refugee, and asylum programs—racial discrimination and politically motivated determinations of status. At the same time as officials of the newly created Refugee Programs Bureau at the Department of State and as Members of Congress who had worked many years on the issue were congratulating themselves on the institution of a nonpolitical definition of refugee, an official of the Haitian desk at the Department of State opined that the U.S. could not accept Haitians as refugees because it was on friendly terms with the Duvalier government. It is not necessary to imply negative motivations to the policy inconsistencies of 1980. This particular situation points to a lapse in communication among the various agencies and departments and the independence and irregularity of accountability of the separate bureaucracies. Deeply ingrained bureaucratic attitudes, like pieces of heavy earth-moving equipment, are especially difficult to turn in new directions without a firm coordinating hand and advanced planning.

Response and Impact in Florida

At the outset, South Florida's response to the "freedom flotilla" was swifter and more generous than the federal response. It had been only five years since the Cuban "freedom flights" had been cut off. The HHS Cuban Refugee Center in Miami was still in operation at 75 percent of its former capacity despite the reduced number of arrivals in the years preceding the new crisis. The Center, the state of Florida, and the local governments, with the assistance of Cuban-American volunteers, established a registration procedure in Key West as boats landed and a processing center in Tamiami to centralize and coordinate the effort to place the new arrivals with their families or with other Cubans in the U.S. Voluntary agencies with prior experience in sponsoring and resettling refugees from Cuba came to the assistance of the local groups. The Cuban-American community raised more than $1 million nationwide and donated food and clothing.

More than 54 percent of the Cubans who arrived between April and June 1980 were resettled with family in this manner without major delay or detention, but the crisis overwhelmed the local effort. FEMA was called in on April 27, and holding centers in military facilities outside the South Florida area were opened during a five-week period in May and June with the cooperation of the Department of Defense: Eglin Air Force Base, Florida; Fort Chaffee, Arkansas; Fort Indiantown Gap, Pennsylvania; and Fort McCoy, Wisconsin.

Although FEMA was already present, on May 5, Governor Robert Graham of Florida formally requested that the President declare a state-of-emergency in Florida. President Carter issued the emergency declaration the next day and also authorized use of the ERMA fund from the Department of State to help cover resettlement costs.

The positive expectations among the Cuban-American community in South Florida were soon strained by Castro's actions. It had been a group of prominent Cuban exiles, the Committee of 75, who had spearheaded efforts toward both better and more open relations and communication between Cuba and America in 1978-1979 and expanded migration. When the Peruvian Embassy was occupied, the exiles in South Florida advocated the admission of all 10,000 asylum-seekers. As numerous first-person reports testify, Cuban-Americans were also the first to feel the shock and disappointment when they viewed their efforts to provide transit to dissidents and relatives manipu-

lated by a cynical leader who included political prisoners and mentally ill among the migrants.

Despite the eagerness of Cuban-Americans to accept their relatives and compatriots at the outset of the crisis, Florida state and local officials questioned how they were going to be able to resettle large numbers of people without massive federal assistance, as had been provided in the earlier Cuban Refugee Program. Florida had been uniquely receptive in absorbing Cuban refugees during the past twenty years, but conditions had also been changing. The growth of the city of Miami from a pleasant tourist mecca to the so-called capital of Latin American trade and banking in that same period of time had been accompanied by growing crime, drug trafficking and money laundering. Further, the new arrivals had lived twenty years under communism. They were less educated, more dependent, and less prepared to adjust to a modern capitalist society.

By mid-May 1980, the problem population that Castro had imposed on the boat owners of the freedom flotilla was beginning to be obvious on the streets of Miami and in the holding camps. Hardened criminals and mental patients released from Cuban hospitals were the most obvious group, but there were also large numbers of unaccompanied minors and the Dade County school system estimated more than 15,000 school-age children would require special facilities. At the height of the crisis when upwards of 10,000 Cubans were arriving in one week, mistakes were made, and many Cubans who had been released without sponsors or whose sponsors had deserted them were becoming street people.

Managing the Crisis

At a hearing in May 1980, members of the Senate Judiciary Committee of both parties, led by Senator Edward Kennedy and responding to appeals from relief organizations, most notably the U.S. Catholic Conference, operating in Florida, advocated application of the new Refugee Act to the Cuban and Haitian arrivals, calling on the administration to let the UNHCR help in screening and designating the refugees within U.S. camps in the same manner as is done abroad. They also called upon the administration to use the Refugee Act to trigger administrative procedures and 100 percent reimbursement of states for job and language training, health care and social services in the process of resettlement equivalent to those currently available to Indochinese refugees. Such an approach would have put into operation immediately the services of ORR/

HHS as well as the Reception and Placement services of the Bureau of Refugee Programs in the Department of State.

Because of a traditional assertion of U.S. sovereignty once aliens were on U.S. territory, the Administration would not accede to the request for the involvement of the UNHCR even in advisory opinions on asylum status for the new arrivals in the U.S., and the UNHCR was less than eager as noted to assist even in third-country resettlement.

A desire to deter potential new arrivals and reassert border controls played a major role in policymaking in an effort to retake the initiative lost through Castro's treachery. The administration was unwilling to admit either Cuban or Haitian boat people as refugees for fear of setting a precedent for other groups. In addition, the chaotic situation in South Florida and the lack of an adequate number of trained INS officials to adjudicate individual cases, not to mention officials in the Department of State's Bureau of Human Rights and Humanitarian Affairs who were required by INS regulations to provide advisory opinions, mitigated against applying the new Refugee Act. The question of funding also hung heavy over the Administration. Focussing on reducing tensions in the Miami community, the Administration wished to avoid any appearance of rewarding the illegal migrants.

Refugees by Any Other Name . . .

For these reasons, as well as in response to critics of apparent unequal treatment of Cuban and Haitian boat people, and in anticipation of Judge King's final ruling, Ambassador Palmieri announced on June 20, 1980, the *ad hoc* designation for both groups of "Cuban-Haitian Entrants (status pending)," under six-month renewable parole authority of the Attorney General. All Cubans who had arrived from April 21 to June 19 and were in INS proceedings were covered by the new designation as well as all Haitians who were in INS proceedings as of June 19. (The status was later extended to include Cuban and Haitian arrivals from June 20 to October 10.)

The Attorney General's parole authority allowed a more flexible, not to mention cost- and time-efficient, procedure of granting temporary status on a group basis, which the Refugee Act with its individual determinations had been intended largely to replace. The Refugee Act specifically proscribed use of parole authority for anyone who could be defined as a "refugee." The "entrant" sta-

tus thus allowed the Administration to sidestep the refugee resettlement benefits requirements of the Act and create an *ad hoc* administration for the resettlement program.

A supplemental appropriation was passed on July 2, and the Cuban-Haitian Entrant Act of 1980 was submitted to the Congress by the Administration on July 31, authorizing 75 percent reimbursement of expenses to the states, as opposed to the 100 percent provided for in the Refugee Act. Senator Kennedy countered on August 5 with his own Entrant Act declaring Cubans and Haitians to be refugees eligible for benefits through the Refugee Act and providing for 100 percent federal reimbursement to the states as specified by the Act. Disagreement between the Administration and Congress was resolved on October 10, 1980, when the Administration belatedly supported special authorizing legislation that was embodied in the so-called Fascell-Stone Amendment to the Refugee Education Assistance Act of 1980.

This oddly-placed piece of legislation provided the first statutory legal definition of Cuban-Haitian entrants, extending coverage back to arrivals since November 1979. More importantly, it stipulated that they would all be treated as refugees, without regard for any future status designation, for the purposes of providing them domestic assistance under the terms of the Refugee Act of 1980 and reimbursing states and localities at 100 percent. Funding authorized by this act was included in the Supplemental Appropriations, Continuing Resolution for FY 1980 and in FY 1981 budget requests.

Thus, a period of uncertainty as to status, benefits, and federal reimbursement of costs came to an end for the most part. The Cuban and Haitian Entrants of 1980 were basically treated like refugees, despite the difference in label and in legislative authority. There never was any intention or sufficient political will to deport any of the new arrivals except those clearly excludable for reasons of criminal activity.

Even were there not forceful lobbies for the states most affected by the resettlement process—and especially Florida— as well as a Cuban-American lobby for their compatriots, the Department of State knew very well that Thailand and other Southeast Asian countries of first asylum were watching closely how America was going to treat *its* boat people. The U.S. could not afford to do anything to cause renewed mistreatment and push-offs of desperate Vietnamese refugees landing in those countries and upset the equilibrium so carefully negotiated the previous year.

The question of regularizing the status of Cuban-Haitian Entrants was left open for a future date and was not resolved until the resurrection in 1984 of the Cuban Adjustment Act of 1966, which, as amended in 1976, allows for Cubans who have been in the U.S. for at least one year to apply for adjustment of status to permanent resident at the discretion of the Attorney General. This special country legislation is unique in that it does not have a cut-off date. It remains in force, although such *ad hoc* country-specific procedures are not favored by Congress. The limitations on the Attorney General's parole authority written into the Refugee Act of 1980 were intended to reduce the necessity for relying on special legislation, but despite repeated efforts the Cuban Adjustment Act of 1966 has never been repealed.

The Cuban-Haitian Task Force

Administratively, there were some awkward results. The CHTF, which was formally brought into being on July 15, 1980, was an entirely new bureaucratic institution, comprised of officials detailed from more than ten different federal agencies, including FEMA for overall funding and mission assignment authority, ORR/HHS for refugee resettlement services, the Department of State for international policy and overall coordination, the Department of Justice and INS for legal status processing, the Department of Defense for holding camps in four different locations, the Department of Education, the Department of Transportation, among others.

Initially, in contrast to the INS response to the trickle of Haitian boat people in the 1970s, the CHTF was under the authority of the Secretary of State and the U.S. Coordinator for Refugees, who was seated in the Department of State. This set-up also contrasted significantly with the earlier Cuban program, which was essentially coordinated from the Department of Health, Education and Welfare [HEW, which preceded HHS]. The crisis had started in Cuba as an international refugee situation, and it continued to have important foreign policy implications. Both the Administration and Congress wanted to use the new structure of the U.S. Coordinator's office to the extent possible, despite its lack of experience or expertise in working with the large number of federal, state, local, and private entities involved. In a confusion of authority, however, which actually helped to strengthen his position with other agencies and departments, the Task Force Director also reported directly to the Presidential Assistant for Intergovernmental Affairs in the White House.

The CHTF continued to rely in large part for funding of camps, staff, and services through the authority of FEMA, which was given the lead role at the outset of the emergency for the practical reasons mentioned above. At the other end of the spectrum, the CHTF reimbursed states and localities for services rendered and subcontracted services to a variety of voluntary refugee resettlement agencies and local community service organizations, which were vital partners in the resettlement process.

Without the authority of the plan of assistance authorized by the Refugee Act, CHTF found one aspect of the resettlement program particularly irksome—the question of unaccompanied minors for whom no guardianship authority was available. The Refugee Act specifically designates to ORR/HHS the role of guardianship for unaccompanied refugee children. Without legislative authority, ORR/HHS would not take on the responsibility for several months. The history of the CHTF reveals that the Task Force repeatedly had to create *ad hoc* assistance to the minors and to sign special contracts with the states for their care.

Among other unanticipated problems that the CHTF faced were the criminal element of the Cuban influx and disruptive actions leading to riots in camps, broken sponsorships leading to a "tent city" in Miami, the need for special legislation to obtain authorization and funding, as well as to settle status questions and care and placement of the mentally ill.

Without a refugee designation for the Cuban and Haitian influx, the Office of the U.S. Coordinator for Refugees in the Department of State began a slow and inevitable withdrawal from resettlement and relief operations as arrivals wound down over the summer after the institution in May of Coast Guard interception and fining of vessels travelling to and from Cuba. The effort to continue internationalizing the crisis also languished. In the long run, one year later, by July 1981, the CHTF was merged with ORR at HHS, its logical home once the emergency period was past and resettlement services and aid to problem cases were the main ongoing requirements.

A full discussion of CHTF management and responsibility is beyond the scope of this overview, but it may be worthwhile for those involved in contingency planning to review the *Report of the Cuban-Haitian Task Force*, November 1, 1980. *Decision and Structure: U.S. Refugee Policy in the Mariel Crisis* by Mario Antonio Rivera also gives a complex and theoretical, but at the same time sympathetic and enlightening, discussion of bureaucratic

politics during the Cuban-Haitian crisis. The CHTF leadership did not have an easy time of it, having to depend on diplomacy and negotiating skills, rather than statute and full authority, to gain assistance from other agencies and departments in solving the myriad problems thrust upon them.

The End of the Emergency

By the time Castro closed Mariel Harbor on September 26, 1980, a total of 124,779 Cubans and 7,785 Haitians had entered the country. On October 9, the United States Interests Section in Havana officially resumed Immigrant Visa Operations for orderly, legal migration. While there was great disappointment in some circles that the new Refugee Act had failed its first test, others in the federal bureaucracies involved, notably those working with the CHTF, congratulated themselves on the flexibility and creativity of their response operations. Questions of how to establish more effective early warning systems and contingency planning as well as entry status determinations for immigration emergencies, were raised that to this day have not been answered.

With the end of the Cuban crisis, the Haitian migration did not end, but rather moved into a new phase. The largest monthly number of Haitians arriving on boats in 1980 was 2,280 in October, when only 10 more Cubans arrived. While monthly Haitians arrivals diminished somewhat after that time, they continued larger than prior to 1980 until the policy of Coast Guard interdiction of boats at sea and temporary detention of arrivals was instituted in the second half of 1981. By 1982, the numbers were smaller than in 1988-1989.

The Coast Guard interdiction was part of a new "program proposal" or contingency plan announced by then Acting Commissioner of INS Doris Meissner to the Senate Judiciary Sub-Committee on Immigration and Refugee Policy on July 31, 1981. The plan combined strong prevention measures to preclude a recurrence of the Mariel crisis with the first legislative proposal to regularize the status of the Cuban-Haitian Entrants. It also signalled that the lead role in any future crisis of direct arrivals in the U.S. under the Reagan Administration would move from the Department of State and the U.S. Coordinator for Refugees to the Immigration and Naturalization Service of the Department of Justice. The story of arrivals from Central America in South Texas in 1988-1989 is a case in point.

THE CENTRAL AMERICAN INFLUX ON THE SOUTHERN BORDER

Anticipation, Information, and Policy Options

Throughout the 1980s and 1990s, the fear and anticipation of a major invasion of illegal economic migrants and asylum seekers from Central America animated federal immigration and refugee policy initiatives and border enforcement.[4] By 1984, according to the UNHCR, more than 300,000 refugees were displaced and living in camps both inside and outside their home countries in Central America and Mexico. Just as President Carter's remark in May 1980 that the U.S. would greet the Mariel Cubans "with open arms" became a focal point for political responses positive and negative to the Cuban crisis, so President Reagan helped set the national agenda when he said that the civil wars to the south would "create a tidal wave of refugees—and this time they'll be 'feet people' and not boat people—swarming our country seeking safe haven . . ." These remarks fed anxieties arising from the Cuban and Haitian influxes and set up a polarization of attitudes—sympathetic or antagonistic— toward the growing numbers fleeing the Central American civil wars and their resulting economic distress.

In 1982, the INS moved ahead with its "Mass Migration Emergency Plan" primarily for South Florida in 1982, which involved mostly the same preventive measures announced by Acting Commissioner Meissner the previous year: (1) interdiction of boats bringing migrants by sea; (2) detention of those who elude interdiction until their status was adjudicated; and (3) deportation of all who were not eligible for resettlement. A plan for a major revision of immigration legislation entitled the Immigration Reform and Control Act [IRCA] preoccupied the Administration and Congress for several years before its passage in 1986, leaving a plan for mass immigration control on the U.S.-Mexican border in draft during that period.

Proposals for the new legislation came about because of the growing perception that illegal migration to the U.S. from all

[4] The question of "undocumented migrants and migrants in an irregular situation" was also high on the international agenda, with a major intergovernmental conference hosted by ICM in Geneva in April 1983. A comparative look at the policies of European countries in this connection is in order but outside the scope of this paper.

around the world, but mostly from south of the border, was out of control. The numbers of illegal residents in the U.S. was variously estimated from three to ten million persons. The omnibus reform bill was also the second stage of the immigration and refugee reform effort that started with the Refugee Act of 1980 and the studies prepared by the Select Commission on Immigration and Refugee Reform from 1979 to 1981. The IRCA legislation approached border control on two fronts: on the one hand, stronger regulation and enforcement, including sanctions against employers of illegal aliens; on the other hand, provision of, among other measures, a time-limited amnesty program for the many illegal aliens already in the U.S. The concept was that once the U.S. could get a handle on the undocumented alien population already in long-term residence and provide them with a humane option to legalize their status, then the U.S. could intensify its enforcement efforts to prevent future illegal arrivals.

The intensifying civil strife in Central America during the 1980s and the resulting refugee crisis served to confound these immigration enforcement expectations. The Department of State responded to the refugee crisis in Central America by continuing to assert that the tradition of regional hospitality and asylum was a viable solution in Central America, although contingent on the availability of international funding. Very few refugees processed in the region were accepted for resettlement in the U.S. under the Department of State's refugee program. Despite U.S. and international funding in the region, a General Accounting Office [GAO] report from July 1984 suggested that resources in Central America were insufficient to care for all those in need in the region.

Expanding Legal Categories for Migration Emergencies: A Trend for the Eighties

As early as 1981, a movement began to extend some form of temporary legal status to those fleeing violence who arrived in the U.S. and were not eligible for asylum status. At the extreme was the sanctuary movement, in which churches asserted a right to provide temporary protection to such asylum-seekers without color of law. In Washington, bipartisan political forces were lining up in support of either an administrative status of “extended voluntary departure” [EVD] for Salvadorans and Nicaraguans or for a broader, legislated status offering “safe

haven" to those fleeing civil strife in their home countries and needing temporary protection.

EVD is a discretionary measure providing temporary relief from deportation for individuals or groups already in the U.S. Granting temporary work authorization as well, it is applied administratively by the Department of Justice when the Department of State determines that conditions in the countries of origin are "unstable" or "unsettled" or show a pattern of "denial of rights" that would put returnees in danger even if they did not have a "well-founded fear" of individual persecution according to the definition of a refugee. Since 1960, EVD status had been given for shorter or longer periods of time to citizens of fourteen countries: Cuba; Czechoslovakia; Cambodia; Vietnam; Laos; Lebanon; Ethiopia; Hungary; Romania; Iran; Nicaragua; Uganda; Afghanistan; and Poland.

For both political and practical reasons, however, there was strong resistance in the Reagan Administration to the application of EVD to Salvadorans and other Central Americans in the 1980s. First, there was the potential size of the problem, the vision of hundreds of thousands of feet people arriving at the southern border and their immigration impact. The problem, which was not resolved in proposing such a temporary status, was how to get the migrant to return to his home country when conditions improved. With the granting of work authorization, EVD became an obvious option for those seeking to circumvent the employment limitations of IRCA. It hardly seemed feasible that INS successfully could lift work authorization and institute deportation proceedings for several hundred thousand Central Americans once conditions improved in their home countries.

Second, there were political and perceptual differences as to the conditions in El Salvador and Nicaragua. The Administration, and those who felt the Administration was on the right track in supporting the Salvadoran government and opposing the Nicaraguan government, portrayed conditions as improving in El Salvador while human rights abuses in Nicaragua had become institutionalized. Those who opposed Administration policies harkened back to the black days of the Salvadoran death squads in 1979-1983 and continued to feel the situation in El Salvador was unstable and dangerous. They protested the fact that much larger percentages of Nicaraguans received favorable decisions on their asylum applications than Salvadorans and accused the Administration of playing politics with human lives. The return of Salvadorans to El Salvador under present conditions, they

protested, was tantamount to "refoulement" (forced return) and a violation of U.S. international obligations under the U.N. Protocol on Refugees.

To answer critics of the U.S. policy of deportation or voluntary return of illegal Salvadoran migrants who did not present an adequate case for asylum, the Department of State contracted with ICM, as an independent international organization, for a program of reception assistance and follow-up for the returnees in order to monitor whether they faced security problems upon their return. Should security problems arise, ICM was to offer them assistance in migrating to other countries. ICM was at that time prescreening and assisting Salvadorans who might be accepted for special "safe haven" status in Canada and Australia, among other countries.

In May 1987, another GAO report concluded that the extent of problems experienced by returned Salvadorans was not determinable on the basis of the data which ICM, the U.S. Embassy in San Salvador, and various human rights and church organizations were able to collect. While the Department of State was quoting ICM data as if it showed that returnees had run into little or no personal danger upon return, ICM was wary of making broad assumptions from its limited data and asserted logistical limitations to its methods, which were based on meeting short-term material assistance needs, not legal protection or human rights criteria. The other organizations had collected data at different, and thus incomparable, times in the fluid and changing situation and on incomparable populations. While there was disagreement on the extent of individually targeted violence in El Salvador, there was more general agreement on all sides of the political spectrum that returnees to El Salvador would face the same range of violence that others in El Salvador faced during the civil war.

In the second half of the decade, as illegal arrivals continued to trickle in along the long and porous southern border, critics of the Administration began to propose legislation to put carefully delineated procedures and criteria for a "safe haven" status into law, rather than leaving the only protection against deportation in times of conflict, barring refugee or asylum status, to the discretionary authority of any particular administration. Country-specific legislation for Salvadorans and Nicaraguans (the Moakley-Deconcini bill) was passed four times by the House of Representatives but, under threat of filibuster, never reached the Senate floor for a vote. A new general status, Temporary Protected Status [TPS], was finally enacted

into law in the Immigration Act of 1990 [IMMACT] and applied first to Salvadorans.

Other remedies utilized were extensive court challenges of INS asylum adjudication procedures. On April 29, 1988, a U.S. District Court judge ordered the INS to stop "employing threats, misrepresentation, subterfuge, and other forms of coercion to induce Salvadorans to accept 'voluntary departure' to El Salvador." The judge held that the 1980 Refugee Act should be interpreted to mandate that those in deportation proceedings had a right to be informed of the possible remedy of applying for asylum to obtain relief from deportation.

Misguided Policies in South Texas 1988-1989

All this controversy aside, it was not until 1988 that mass numbers of asylum-seekers sought again to enter the U.S. in an uncontrolled manner as in Florida in 1980. Even then, the "crisis" atmosphere that pervaded South Texas briefly in 1988-1989 could be said to have been caused by an ill-advised, but largely misinterpreted *ad hoc* statement of Attorney General Edwin Meese and by localized policy changes by the INS District Office in South Texas. All the Attorney General had said was that Nicaraguan applicants for asylum who had fled their country on the basis of a well-founded fear of persecution would be considered positively. But, this restatement of basic asylum policy was taken both by Nicaraguans and by some INS officials in its context without mention of Salvadorans as a political indication that Nicaraguans would receive preferential treatment for their asylum applications.

As a result, apprehension of illegal Nicaraguans along the South Texas border jumped exponentially, reaching nearly 50 percent of all border apprehensions, or 14,243 persons, in the Harlingen District by the last six months of 1988. Probably due to greater availability of information on the asylum process and work authorization following the District Court decision, asylum requests from all groups from Central America—Salvadorans, Guatemalans and Hondurans, as well as the Nicaraguans—grew to exceed 50,000 for FY 1988, according to a Congressional staff report, which also predicted that if arrivals and applications for asylum continued to increase at the same rate, there would be 100,000 in FY 1989, a figure that was beginning to look more like the Cuban crisis numbers.

At first, most of the asylum seekers arriving in the Rio Grande Valley of South Texas received work authorization and were allowed to travel to their intended destinations to stay with family or friends and to apply for asylum with the local INS office. But, as numbers increased, facilities in such locations as Miami and Los Angeles, where there were anchor communities of Central Americans acting as magnets, became overburdened, and local communities as well as the INS began to fear no end in sight to the influx.

In response, the INS District Director in South Texas instituted a series of control and deterrence mechanisms on December 16, 1988, requiring that all asylum applicants file their applications immediately at the INS Harlingen facility and have their initial interview there before travelling to any other location. A roadblock on the highway out of the Valley effectively kept aliens from travelling north without proper papers.

Unforeseen Consequences: Bringing the Long-Expected Crisis

Applications for asylum quickly rose to some 6,000 a month at the Harlingen INS office, which was not equipped to handle the numbers, and backlogs of asylum applicants were quoted as high as 20,000. These numbers may seem relatively minor compared to the 100,000 Cuban entrants in April and May 1980, but the homeless migrants were very obvious in the small cities of Harlingen and Brownsville. With national media watching, they were wandering the streets, sleeping out in front of the INS facility, illegally squatting in an abandoned motel, and camping out in vacant lots by the end of December, despite a sudden spate of cold weather.

The border communities, which were already suffering from economic depression, with 18 percent unemployment, were outraged and sought relief from the unfair burden put on them by INS procedures. The travel restrictions imposed by the INS forced the asylum-seekers to stay in the Valley rather than allowing for the natural distribution of the social burden to other parts of the country where family and friends could assist the new arrivals. Some in the border communities reacted with hostility to the newcomers and the situation was getting explosive. Thus, an *ad hoc* plan to relieve burdens on other communities and INS offices, while attempting to deter new arrivals, had actually become in large part the cause of a localized immigration emergency in South Texas.

National media and humanitarian and human rights groups emphasized the suffering of the asylum-seekers and the alleged violations of their due process rights that the new INS system appeared to cause. INS was accused of failing to follow its own rulemaking by not giving adequate notice of proposed procedural changes that would have allowed the community to testify to the social consequences of the new policy and would have provided time for raising any legal challenges to the procedures.

Because of the paucity of legal services in the Valley, the travel restrictions deprived asylum applicants adequate information and legal counsel concerning their rights under American law. In 1989, there were only three lawyers in the Rio Grande Valley able to offer *pro bono* legal services to the asylum-seekers and only three in private practice who would assist for a fee. Four voluntary groups providing legal assistance also utilized three or four volunteer paralegals among them at any one time. Taxi drivers and other unscrupulous individuals were profiteering from the asylum applicants, filling out obviously fraudulent applications for them at a price, which applicants were willing to pay in hopes just to get out of the Valley and join relatives elsewhere.

At least two of the voluntary groups were politically motivated in opposition to U.S. policies and actions in Central American and refused to serve Nicaraguans, whom, they were convinced, were Contras or Contra deserters, and whom, they felt, had the protection of the Attorney General in any case. An outside observer independently interviewing some of the asylum seekers noted that this political assumption was false. Many of the Nicaraguans were indeed deserters, but from forced conscription and re-enlistment into the Sandinista army. Basically nonpolitical, they fled their country in disillusionment and despair at the continuing civil war and impossible living conditions for their families. A Congressional staff study group concurred with the view that there was no single reason for the sudden escalation in Central American arrivals, noting that it appeared that many were now simply "giving up" on their homelands.

Crisis Resolution

Class action litigation undertaken jointly by both community and out-of-state attorneys resulted in a temporary restraining order from the U.S. District Court in January 1989 requiring the INS to revert to its previous policy of allowing asylum-seekers to be transferred to other districts. The overload of asylum seekers in the Valley dispersed around the country early

in 1989, "scattered to the four winds," as Attorney General Thornburgh described it. INS reported that of 2,541 applicants in Harlingen who had requested that their files be transferred for adjudication to Miami, only 371 appeared for their interviews in Miami 14 days later.

While the restraining order was in effect, INS and the Department of Justice had time to develop a plan for addressing the rising number of "frivolous" asylum applications from Central Americans. On February 20, 1989, when the restraining order was lifted, INS announced and instituted a program with the necessary staffing which, in brief, provided for accelerated adjudication of affirmative asylum claims, immediate detention and initiation of deportation proceedings for applicants whose claims appeared frivolous or without apparent merit, and holding camps for those detained for deportation or awaiting appeals.

The Community Relations Service of the Department of Justice was mandated to insure that families were kept together, which was possible in facilities managed by the American Red Cross, and that adequate juvenile facilities were available for unaccompanied minors. Three such centers were funded in rural areas or small towns not far from Harlingen, and the unaccompanied minors, mostly single male teenagers, were cared for in relatively pleasant surroundings for a few weeks until they could be processed out to relatives or foster families willing to act as guardians while asylum applications were processed. The INS alien detention facility for single adults was located at Bayview, Texas, in a prison-like setting.

The care with which the new program was developed and instituted made it immune to further successful class action legal challenges, and the program, which attained its goals from the INS point of view, resulted in significant deterrence to potentially frivolous asylum applications from Central Americans, while expediting affirmative applications with merit. After the 9,502 pending asylum applications from January and February 1989 were dispersed, there were only 975 cumulative applications in the Rio Grande district through October 23, 1989. These figures compare to 28,541 affirmative asylum applicants in 1988.

Apprehensions thus dropped precipitously after the deterrent effect of the new procedures kicked in. Guatemalan and Honduran monthly apprehensions leveled off at or below monthly levels at the end of 1987. Figures for Salvadoran apprehensions in September, October, and November 1989 were significantly lower than comparable months two years earlier in

1987, while Nicaraguan numbers remained about double the 1987 monthly levels but ceased accelerating.

The bipartisan Senate subcommittee staff report declared the new INS policy toward South Texas "appropriate" and "effective in deterring frivolous asylum applications," although "certain adjustments" were recommended to assure greater opportunities for nonfrivolous applicants. The report also noted that the local community had been remarkably tolerant of the Central Americans, while at the same time local leaders were understandably impatient with the sluggish federal response. In Harlingen itself, as crowds of Central American asylum applicants gathered around the INS office and were eating, sleeping, and carrying out personal functions in public while saving their places in line for processing of their applications, the town mayor even went so far as to padlock the INS office for code violations.

What is distinctive about the South Texas situation, as in the case of the initial Haitian arrivals ten years earlier, is the *ad hoc* nature of the federal response. Then INS Commissioner Alan Nelson was known to give considerable leeway in authority to INS District Directors. The emergency contingency plans proposed in the early 1980s were not finalized until the 1990s. In the meantime, INS District Directors appeared to be in a tug-of-war with Federal District Courts, formulating enforcement and deterrent policies without much attention to the niceties of rulemaking procedures and then having to pull back from them in the middle of a crisis.

Unlike the Cuban crisis, there was never any intention to consider the asylum seekers in South Texas for paroled entry as a group. However, the long and tedious process of individual asylum adjudication and appeal, not to mention deportation hearings for those denied asylum, meant that most of those seeking asylum would remain in the U.S. for some time, even under the accelerated procedures. Delay was, indeed, a strategy of choice used by attorneys handling asylum cases. A study by the GAO in January 1987 concluded that, even when asylum applications were denied, few denied applicants were actually being deported.

A class action suit originally brought in 1985, *American Baptist Churches v. Thornburgh*, was finally settled in December 1990, with the agreement by the U.S. government to readjudicate the asylum claims of all Salvadorans and Guatemalans who had been denied since 1980 because of discriminatory treatment in government determinations of asylum, deportation, and EVD. The settlement of

the so-called "ABC" case, combined with the TPS, has meant that only a very small percentage of Central Americans who arrived in the 1980s have ever been deported. Nearly 200,000 originally registered for "ABC" or TPS (the registration requirements were combined to save on costs); four years later, with repeated extension of the status or delay of deportation they still are in the country even though the civil war and economic crisis which precipitated their migration is largely over.[5]

THE 1980s EXPERIENCE

Lessons Learned

For a coordinated federal response and Presidential declaration of a national immigration emergency, no consistent definition without color of separate bureaucracies appears to have emerged from the experiences of the 1980s. The President, rather is left with a palette from which he can pick or choose depending upon which agencies he wishes to activate. All of the following might be part of the definition:

- Imminent danger either to the lives of those arriving or to residents in the community of arrival, or both;
- Capacity of local officials and local offices of federal agencies to manage a benchmark number of direct arrivals within a limited period of time;
- Security and social services required and their availability locally; legal status or potential legal status of the immigrants; manner of arrival and physical condition of those arriving; economic and/or social impact on the community;
- Duration or potential duration of the crisis; and
- International and domestic political repercussions.

The lack of more specific triggering devices and the bureaucratic politics of the federal response appears to contribute significantly to what some have called the federal molasses and to the frustration of local communities in the face of an influx. In the Cuban crisis, it took weeks before a strong federal presence took over reception, processing, housing, and security in Florida, and it was months before the question of federal reimbursement of services to states and localities was resolved through legislation introduced by a Florida congressman.

Some of the delay is probably inherent in the nature of the crisis, both in the objective, but unpredictable, numerical aspects of an influx of people and in the more subjective legal and foreign policy aspects that must be considered. Flexible policymaking has characterized the U.S. approach to immigration and refugee admissions and is unlikely to be eliminated entirely through contingency planning, if experience is any guide, because of this mixture of humanitarian, legal, and foreign policy considerations, and because of the participation in the decisionmaking of a variety of institutions with different agendas. While response may be delayed, there are some times when such delays are useful. The delegation of authority for quick response to federal district officials, as in the South Texas situation, resulted in inappropriate and inhumane actions and a social and legal crisis that might have been avoided.

Another question is raised by the South Texas situation in which the immigrants were allowed to disperse to other regions of the country: Was there ever a real emergency? Except for the pressures on INS District Offices of processing large numbers of asylum applications, it is not clear that the country or even the South Texas region was ever overwhelmed by the influx until movement was restricted to a limited region. Attorney General Thornburgh's remarks that the asylum-seekers were mostly scattered to the four winds never to be seen again imply that the country could absorb the illegal immigrants without major distress or federal assistance.

In contrast, the large numbers of Cubans arriving *and* desiring to settle in South Florida presented a major social and economic problem, even when the community was enthusiastic about resettling them.

Aspects of Contingency Planning

Once an immigration emergency is recognized, prompt action is paramount to avoid human tragedy and/or political disaster. Both the Cuban-Haitian and the Central American influxes demonstrated a confusion in priorities and authorities just at a time when clear thinking and action would have been helpful. Evidence from these two crises points to the following areas where advance decisions for contingency planning in the case of an immigration emergency are needed.

1. **Clear articulation of the national interest.** Criteria shold be developed to use in determining whether legal, humanitarian, or foreign policy

concerns should take precedence. Such criteria may include in the foreign policy area: a balancing of U.S. domestic impact against the conditions in the country of origin of the migrant; the circumstances of departure and personal condition of the illegal entrant; and international standards and treaty obligations, as well as bilateral relations. From a humanitarian, domestic point of view, consideration should be given to: the size of the group and the predictability of the flow; other immediate international options; and relationship with existing ethnic communities in the U.S. that could relieve federal, state, or local authorities of immediate responsibility for a short or long stay.

Legal consideration may have to be delayed in order to meet these value-oriented criteria and to serve the overall national interest. Court cases in the 1980s pushed INS toward more humane and equitable procedures, and the public debate over status issues that resulted in TPS legislation in 1990 made it clear that humanitarian concerns are a major component of the national interest.

Whatever the legal status of the Cuban influx, humanitarian and political circumstance dictated a policy of acceptance, and relationships with the Cuban-American community made possible the immediate resettlement of the majority of those arriving. Had a decision been made at the outset to follow this path of least resistance, then refugee services through existing procedures might have been made available immediately. Indecision and inconsistency in policies, combined with negative media portrayals, contributed to the national anxiety.

2. **Recognition of the nature of services needed.** If resettlement or temporary protection of the arriving group seems the most likely solution, determination should be made as to whether they are to be treated and provided services like refugees or like immigrants, whatever their eventual legal status.

   Refugees have particular characteristics of vulnerability caused by sudden flight: no material preparation in advance ("leaving with just the clothes on their backs"); an involuntary or unplanned migration based on fear, not anticipation of a chosen new life; and estrangement from family members and culture. Both the procedures laid out in the Refu-

gee Act of 1980 to ease resettlement and an experienced cadre of federal officials, state, local, and voluntary agencies consider these factors in planning for reception and placement, health services, housing, orientation, and income-producing activity for the refugee. If the arriving group has refugee-like characteristics, as the Cuban group did, then it would appear more practical to activate immediately the existing refugee services rather than penalize the group, jeopardize successful resettlement through delays or diminution of services, and place unwarranted burdens on impacted communities.

Immigrants arriving voluntarily on a legal or illegal basis, on the other hand, may have existing contacts and planned resources for integrating themselves into the economy and finding their place in the culture. The cost of individual *refugee* resettlement can be discussed in concrete terms; the cost of *immigrant* resettlement cannot be discussed except in the most general terms because the immigrant is largely free-living. In the long run, the smaller group of illegal arrivals in South Texas and other asylum-seekers who trickled in during the 1980s followed the immigrant pattern of resettlement, dispersing themselves around the country and using their own contacts to resettle and find work, whether or not they ever regularized their legal status.

Community concentration and impact, as well as aggregate numbers and conditions of the migrants, also must be considered in determining whether to activate federal services. State and local governments view refugees and indigent migrants as a segment of the dependent population that may require cash assistance, medical services, job training, and schools. Gradual increases or changes in such populations can be accommodated, but a sudden influx, as in South Florida *and* South Texas, is seen as an imposition of a federal problem on the local community, demanding consultation between federal and local officials on policy and on federal impact assistance.

3. **Adequacy of legal criteria.** Only once these primarily humanitarian and domestic considerations are resolved for mass arrivals, can questions of legal status and procedures adequately be approached. As was seen in the South Texas situation, legal status issues and procedural changes took precedence over hu-

manitarian concerns and community impact, resulting in a crisis that could have been avoided. In the Cuban situation, the attempt to emphasize international responsibility faltered and was finally buried by the burdens of the domestic situation.

While a clear articulation of the national interest in case of an immigration emergency was not forthcoming in the 1980s, legal categories open for discussion included: immigrant, refugee, asylee, and parole status; the special Cuban-Haitian entrant (status pending); the possibility of EVD; "safe haven;" and TPS. This proliferation of categories may be seen as a reflection of the difficulties in reaching a "merciful" determination using legal statutes and procedures. It may be that the Geneva Convention definition of a refugee is not adequate for U.S. situations, or at least not when applied on an individual basis.

New INS procedures, promulgated in the 1990s with careful regard for the instructions of the courts, are considerably less biased in asylum determinations, but the applicant still faces long waits for adjudication and, as in the case of the Salvadorans, still is unlikely to be deported quickly if turned down. Americans may have to listen to their own voices on the question of status. Is the U.S. really willing to take punitive steps against large numbers of people coming to this country in an immigration emergency?

4. **Alternatives to domestic resettlement.** While it is beyond the scope of this paper to discuss alternatives to domestic resettlement in detail, a few remarks are in order. Contingency planning requires advance thought as to the potential for third-country resettlement or internationalization, deterrence, detention, interdiction at sea and deportation. In addition, although the issues have yet to be effectively approached, various forms of return assistance to those whose status has come to an end because of improvements in their home country should be considered. There are international models that combine return assistance to the individual migrant and his family with economic development assistance to the country of return.

5. **Handling of special cases.** Every mass movement of peoples has a

different demographic composition. On the basis of experience in other refugee or mass immigration emergencies, models of assistance to women, children, single men, invalids, the mentally ill, and criminal elements may be available and should be considered in contingency planning. The Refugee Act of 1980 made specific provision for unaccompanied refugee children in recognition of the frequency with which this special group appears in refugee movements and of the special services they require. Because the Refugee Act was not used at the outset for setting up a services for the Cuban entrants, the needs of unaccompanied minors initially were not met adequately, even though they could have been anticipated. Marielito Cubans, who had come from prisons or mental hospitals, exhibited extreme characteristics not necessarily normal among mass immigration populations.

6. **Preparation and coordination.** In 1993, the Department of State proposed the abolition of the position of U.S. Coordinator for Refugees that had been created by the Refugee Act of 1980. There has not been a political whimper to greet its demise. In the years since 1980, the Coordinator, usually a political appointee with little experience with the extensive federal bureaucracy, could not carry out fully his/her role. Even at the time of the Cuban-Haitian crisis, the Director of the CHTF reported both to the Coordinator's office and to the White House.

The problem with this separate permanent office for a coordinator is that the working staffs are in other offices, departments, or agencies, and under other supervision, rules, and traditions. At the Department of State, the Coordinator relied for substance and operations on the Refugee Bureau, which was headed by a Director with Assistant Secretary status. The Coordinator's position was even weaker in relation to every other department and agency. In 1981, the Select Commission had recommended that the Coordinator's office be in the White House. Whoever is appointed by the President to coordinate an immigration emergency must have the authority and experience in the government to carry out the responsibility effectively.

Final Remarks

An immigration emergency is by its very nature an unanticipated situation. Contingency planning may anticipate different kinds of emergencies, project special situations concerning individual countries, and make plans for deterrents or management. Both the Department of State and the Department of Justice have established committees to do so. If successful, contingency planning—both administrative and legislative—will avert an emergency. There is no such thing as budgeting for contingencies, nor can the President be certain in advance which agency or department should lead in any specific emergency. What is certain is that clear values and goals, a national interest, must be articulated that all will adhere to when carrying out what, of necessity, may be *ad hoc* procedures if, and when, an emergency occurs.

APPENDIX

Refugee Act of 1980 Definition of Refugee

The term 'refugee' means (A) any person who is outside any country of such person's nationality or in the case of a person having no nationality, is outside any country in which such person last habitually resided, and is unable to avail himself or herself of the protection of, that country because of persecution or a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion, or (B) in such special circumstances as the President after appropriate consultation . . . may specify, any person who is within the country of such person's nationality or, in the case of a person having no nationality, within the country in which such person is habitually residing, and who is persecuted or who has a well-founded fear of persecution on account of race, religion, nationality, membership in a particular social group, or political opinion. The term 'refugee' does not include any person who ordered, incited, assisted, or otherwise participated in the persecution of any person on account of race, religion, nationality, membership in a particular social group, or political opinion.

The Commission's Research Papers, which present the results of Commission-sponsored research, are intended to elicit comment and provoke discussion. The views presented in these papers are those of the authors and do not necessarily reflect those of the commission.

INTRODUCTION

This paper examines the relationship between U.S. immigration, foreign policy, and national security. It assumes that the primary interest of the United States is its national security and that the ultimate goal of U.S. foreign policy is to promote U.S. national security. The paper outlines the ways in which immigration has been affected by the national security interests and foreign policies of the United States as well as the way in which immigration has affected national security concerns and resulting foreign policy.

NATIONAL SECURITY

The initial difficulty in determining whether immigration to the United States constitutes a national security threat is determining what constitutes national security. Terms such as "national interest" and "national security" do not have a universally agreed-upon meaning. The term "security" covers a range of goals so wide that highly divergent policies can be interpreted as politics of security (Wolfers 1982:118).

Traditional notions of national security are represented by theorists such as Hans J. Morgenthau for whom the national interest contained ". . . two elements, one that is logically required and in that sense necessary, and one that is variable and determined by circumstances" (Morgenthau 1982:972). The survival of the state is the necessary element of national interest and the minimum requirements of the national interest are the integrity of the nation's territory, its political institutions, and its culture (Morgenthau 1982:973). It was this theory of national security that held sway—largely uncontested—throughout the Cold War period.

Since the 1980s—and accelerating with the end of the Cold War—the content of national security concerns has expanded from the traditional focus on military threats to borders and governments to include nonmilitary sources of insecurity (Rogers & Copeland 1993:12). An example of this more expansive notion is advanced by Richard Ullman who considers as a threat to a state's security any actions or events that "threaten significantly to narrow the range of policy choices available to the government of a state or to private, non-governmental entities (persons, groups, corporations) within the state" (Ullman 1983:133).

In a similar vein, the January 31, 1992 Summit Declaration of the United Nations Security Council acknowledged that threats to international peace and secu-

rity can come from nonmilitary sources of instability in the economic, social, humanitarian, and ecological fields and that such conflicts fall within the Security Council's sphere of action. The Declaration also called for election monitoring, human rights verification, and repatriation of refugees as integral parts of the Security Council's efforts to maintain international peace and security (Rogers & Copeland 1993:12).

However, these recent broadened ideas of national security stretch the concept to a point where its application would lead to illogical results. Under the recent definitions, a military attack against the United States is equivalent to a totalitarian regime refusing to allow a United States-based human rights organization to operate in its country. Clearly the former represents a threat to national security and warrants a military response. Just as clearly, the latter does not. Therefore, this paper treats national security as it has been defined in the traditional sense. As will be demonstrated, immigration can be a threat to traditional ideas of national security even if one concludes it has not yet posed such a threat to the United States.

The recently expanded definitions of national security, therefore, elevate interests that Morgenthau would have considered as variable or secondary to necessary and make it easier to classify immigrants and refugees as national security threats. Morgenthau wrote that a state can never compromise or trade a primary interest. Yet the history of United States immigration and refugee policy is a series of compromises and trade-offs. Thus, it is fair to conclude that for the United States immigration is a variable interest, one which at any particular time it chooses to regard as a national interest (Morgenthau 1958:66).

Some argue that current immigration poses a threat to U.S. national security. They see immigration as a threat to the language and culture, destroying the sense of nationhood. Others believe immigrants an economic threat, taking jobs from U.S. citizens and imposing prohibitive costs by their use of social services. Still others draw a relationship between immigration and terrorism or increased crime.

Alternatively, some argue that immigration bolsters our national security. Access to talent in a properly-regulated immigration system strengthens American resources in science and the humanities. Examples abound of American-immigrant Nobel laureates, renowned inventors, business leaders, and scientists who have made immeasurable contributions to our prosperity (U.S. Commission on Immigration Reform 1995:23). For example, the

admission of scientists fleeing from Germany and Italy before World War II was instrumental in the United States being the first to produce atomic weapons and gave the U.S. a distinct advantage in nuclear research. Highly-skilled immigrants supply talented workers for America's world-class medical establishment, engineering sector, and higher education (U.S. Commission on Immigration Reform 1995:22). These immigrants enhance the research and development capacity of U.S. firms and bring foreign language skills, contacts, knowledge, and experience that appear to offer a unique advantage in a global business community.

Strong immigrant support for family values strengthen and reinvigorate American values. Immigrants often play important and visible roles at the highest levels of the U.S. military and federal and local government. Renowned immigrant artists, performers, and athletes strengthen and diversify cultural institutions (U.S. Commission on Immigration Reform 1995:23). The United States has been the world's largest multiethnic and multicultural society, successfully integrating new immigrants from diverse heritages.

MIGRANT EFFECTS

Myron Weiner identified five broad categories in which refugees or migrants may be perceived as either a threat or a benefit to the sending country, to the receiving country, or to relations between the two (Weiner 1992/93:105-06).

Opposition to Home Country Government

When refugees and migrants are opposed to the regime of their home country, they can threaten relations between sending and receiving countries in several ways. A host country's decision to grant asylum based on a finding that a fear of persecution exists may be treated by the home country as interference in its affairs. The People's Republic of China responded in this manner to the 1990 U.S. congressional debate over whether Chinese students should be permitted to remain in the United States because of persecution in China. When a host country actively supports a refugee group's effort to overthrow the homeland government, such as in the Bay of Pigs or United States support for the *contras* against the Nicaraguan

government, tensions are certain to be exacerbated. However, whether the national security of the host state is threatened depends on the abilities of the home country to respond against the host. For example, although the Cuban government may object to the opposition activities of Cuban-Americans, Cuba lacks the ability to pose a credible threat to U.S. national security. Nevertheless, the activities of migrants still can create foreign policy problems for host countries, even if those problems do not pose a threat to national security.

Immigration from hostile nations also can advance U.S. national security. Immigrants from these countries can be a valuable source of intelligence, they can use their freedoms here to publicize repressive or discriminatory practices at home, they can fundraise and supply opposition political movements supported by the United States and in the extreme case, such as the Bay of Pigs, provide the personnel for military action or covert operations against U.S. enemies.

Immigrants also can strengthen America's political and economic ties with other nations. The knowledge they bring with them and their ties to their home country enhance the ability of the United States to understand other countries and cultures. Immigrants also can disseminate information about the U.S. that may improve other countries' understanding of us. Immigration from friendly countries can serve as a safety valve that increases the political stability of these states.

Political/Security Threat

The second category identified by Weiner is perception of migrants or refugees as a political threat or security threat to the regime of the host country. This was exemplified in the bombing of the World Trade Center by a group of Middle Eastern immigrants and asylum seekers and the murder of several CIA employees, both in the fall of 1992. Although incidents of this nature have been relatively isolated, the perception of a link between immigration and terrorism leads to legislative action such as the Violent Crime Control and Law Enforcement Act of 1994 and the Antiterrorism and Effective Death Penalty Act of 1996 that responded to perceptions of problems, including asylum abuse by potential terrorists, the inability to remove criminal aliens from the United States, and porous borders that make illegal entry far too easy.

Legislators from diverse ends of the political spectrum, such as Lamar Smith (R-TX), Chairman of the House Subcommittee on Immigration and Claims and Edward M. Kennedy (D-MA) can

sound remarkably similar on these subjects: Smith said "our immigration laws and procedures are being overwhelmed by applicants for asylum, many of whom are making fraudulent claims and some of whom are terrorists (U.S. House of Representatives 1996:1); Kennedy said "a clear sign of the crisis in illegal immigration is that we have lost control over the process for removing illegal, and especially, criminal aliens from the United States" (U.S. Senate 1993:1). The 1997 arrest of Ghazi Abu Maizar in Brooklyn for plotting to bomb the New York City subway system, after being caught three times trying to sneak into the United States and then being released pending an asylum application that acknowledged that Israel considered him to be a terrorist, demonstrates the degree of difficulty in addressing this problem (Barry 1997:1). The ease with which radical Islamic preacher Sheik Omar Abdel Rahman entered and exited the United States, despite being on the Department of State's watch list of potential security threats, and the use of the asylum process to remain in the U.S. by those involved in the World Trade Center bombing and murder of the two CIA employees clearly spurred legislative action.

The United States, like any host country, will remain vulnerable to reprisals (such as terrorist attacks) from sending countries who believe that the United States is too supportive of opposition political groups. Terrorist attacks also may be a response to U.S. foreign policy actions, such as support for a particular country, economic embargo, or military action. Although the relative paucity of such attacks by immigrants to date is strong evidence that U.S. national security is not currently threatened by immigration, more intensive measures to prevent the entry of potential terrorist threats is warranted.

Immigrant groups also may pose a security threat to host countries by smuggling arms or people, forming alliances with domestic opposition groups, or participating in drug trafficking. Palestinians became an important political force in Jordan and Lebanon and, ultimately, engaged in armed conflict in those countries. When a host country arms refugees for their struggle against the home country, they create risks that the refugees may seek to dictate the host country's policies toward the sending country or invite armed intervention from the sending country. Hutu refugees who launched attacks against Rwanda from Zaire undoubtedly were instrumental in provoking Rwandan support for Zairian rebels who recently overthrew the regime of Mobutu Sese Seko.

Another threat is the smuggling of aliens into a country. Smuggling into the U.S. from China is estimated to be as high as several hundred thousand people per year (Zimmerman 1995:101). Not only is the smuggling illegal, those smuggled in often are forced to endure abusive living and working conditions while they, and or their friends and relatives, attempt to pay smugglers' fees that can be as high as $35,000 per person (Burdman 1993:A1). The recent case of deaf Mexicans in New York City, the drowning of smuggled Chinese immigrants after the grounding of the smuggling ship Golden Venture, the smuggling and virtual enslaving of illegal aliens by employees of the Georgia Peach Harvester Lane Packing Company all attest to the breadth of this problem. In 1993, in response to such incidents, President Clinton declared the problem to be a national security threat and charged the National Security Council with responsibility for dealing with it (Russell 1995:83-4).

Smuggling of immigrants into the United States is believed to be a $3 billion per-year business (Burdman 1993:A1). Groups engaged in smuggling also are linked to narcotics trafficking. The immense profits to be made in smuggling immigrants has attracted established crime rings that now control the smuggling trade. Efforts to control the smuggling trade have led to gang warfare in the United States, as in the murder of four members of the Fuk Ching gang in New Jersey in 1993 (Hanley 1993:B1). In response to the criminal nature of these activities, the Violent Crime Control and Law Enforcement Act of 1994 increased the penalties for most alien smuggling offenses.

Cultural Threat or Contribution

A violation of the norms of the host country may be regarded as a threat to basic values and a threat to national security. How a host community defines itself and how they decide who can be admitted into the community will determine the rights and privileges of those permitted to enter and whether the host culture regards a migrant community as potential citizens.

These host country norms often are reflected in a state's citizenship laws, those based on *jus sanguinis*, citizenship based on that of the parents, regardless of place of birth and *jus soli*, citizenship based on place of birth. The United States recognizes both the *jus soli* and *jus sanguinis* doctrines (Goldstein & Piazza 1996:519). Thus, United States citizenship may be acquired by either birth or naturalization. Persons born here automatically are citizens; in most situations a child born

abroad to U.S. citizens also is considered a U.S. citizen. U.S. naturalization law requires applicants to demonstrate knowledge of the U.S. Constitution and form of government and swear an oath of allegiance, thus political knowledge and loyalty are sufficient norms for citizenship. This is a valuable method of assimilating new immigrants as it requires a conscious choice and effort for immigrants to obtain U.S. citizenship.

Regardless of the manner in which citizenship is obtained, most societies react with alarm when they perceive that there are too many immigrants who do not share the culture and national identity of the host population. The United States has suffered from this perception periodically throughout its history. Racist theories held that certain nationalities were culturally inassimilable and racially inferior (Fuchs 1983:300). The 1882 Chinese Exclusion Act, the 1907 "Gentlemen's Agreement" with Japan, and the U.S. Immigration Act of 1924 all resulted from pseudoscientific assaults on immigration that claimed that the most recent immigrants came from inferior racial stock and were handicapped in ways that would make them unfit for American civilization (Morris 1985:18).

While more refined, much of the criticism of current U.S. immigration is based on the perception of a cultural threat (Massey 1995:631; Brimelow 1995:249, 18; Nelson 1994:94). Perception of a cultural threat to national security has led to proposed constitutional amendments that would deny citizenship to those born in the United States to noncitizens It also has led to the passage of English only or "official English" laws in several states and a 1996 attempt in the U.S. House of Representatives to make English the official language of the United States.

These arguments ignore the ability of United States culture and society to assimilate large numbers of people from diverse countries of origin. Despite past fears concerning the effects of immigration on the social fabric of the United States, few socioeconomic differences now separate the descendants of immigrants from Europe (National Research Council 1997:S-10). With the convergence of socioeconomic status across generations, most immigrants disperse from the ethnic neighborhoods where they first tend to settle and integrate with the overall population. Residential movements have parallels in intermarriage among immigrant groups. Today, the descendants of immigrants from various European countries and of various religions, once so distinct they were referred to as races, have intermarried to such an extent as to virtually erase differences in education, income, and occupation (National Research Council 1997:S-10).

Much the same is true concerning English language ability. Proponents of the cultural threat to national security believe that the sense of nationhood is lost when people do not speak a common language. For them, linguistic diversity is tantamount to national disunity. Language becomes a symbol and serves as a means of communication and also "a means of communion" (King 1997:64). According to the 1990 census, 94 percent of U.S. residents speak English reasonably well. Three-fifths of the immigrants who arrived in the 1980s spoke English well or very well. Not many immigrants see their first language survive into the second generation. The common lament of first generation immigrants is that their children are not learning their language and are losing the culture of the parents (King 1997:64). A majority of third-generation Mexican-Americans living in the United States speak only English. Further,

> No religious, ethno-religious, or purely ethnic group of any size has ever attacked basic American political values. Nor has any tried to form an ethnic party. Nor has any group ever tried to prevent its children and grandchildren from learning English, except for some unsuccessful efforts among rural Germans and Scandinavians (Fuchs 1983:293).

Moreover, the extraordinary number of immigrants now naturalizing probably will serve to accelerate the assimilation process. Adoption of the U.S. Commission on Immigration Reform's recommendations for the Americanization of new immigrants also would serve to reduce the perceived cultural threats from immigrants (U.S. Commission on Immigration Reform 1995:175). That report found that:

> The benefits of naturalization are even more compelling for American society as a whole than for the new citizen. . . . Naturalization, then, goes far beyond providing new citizens with benefits. It is about ensuring the vitality of this nation through the inclusion of new members and through cohesion of our nation's peoples, ensuring continuity of our past, present, and future (U.S. Commission on Immigration Reform 1995:178-179).

The contributions of immigrants to various aspects of American culture are too numerous to mention. In painting, sculpture, music, dance, scholarship, fashion, popular entertainment, and sports, immigrants have brought elements of their own culture and have embraced, reinterpreted, and reinvigorated American culture to produce a product, which although

uniquely American in its formation, has near universal appeal. American music, film, and fashion have become increasingly popular throughout the world as they exalt American values in a context readily understandable to people all over the planet. Alternatively, aspects of culture brought by immigrant groups survive intact. Residents of the United States can listen to music such as salsa and reggae and enjoy scores of different cuisines. The presence of the culture of immigrants expands the recreational and leisure activities available to United States citizens and enhances our knowledge and appreciation of other cultures and peoples. Ultimately, this enhances the ability of Americans to communicate, travel, and conduct business abroad, enriching us socially and economically.

Most immigrants come to the United States with a commitment to the American values of liberty, democracy, and equal opportunity. The United States has united immigrants and their descendants into the most successful multiethnic nation in history. In turn, core American values are strengthened by the inclusion into society of people who, in many cases, made great sacrifices in pursuit of these ideals.

Social or Economic Burden or Contribution

Migrants may be perceived as a social or economic burden because of the fiscal costs they impose or because of their purported social behavior, such as criminality or welfare dependency. Societies may fear that the number of people entering are so numerous that they will create a substantial economic burden by straining housing, education, and transportation facilities. In advanced industrial societies, services provided by the welfare state to newcomers may generate resentment. The willingness to bear these costs is likely to be low if the host government believes that the government of the sending country is "dumping" its unwanted population on the receiving country, although historically this has not been a significant element in the flow of migrants from the Third World to advanced industrial countries (Weiner 1992/93:114-15).

The perception that immigrants receive social welfare benefits for which they are ineligible or manipulate the asylum process to delay their removal from the United States results in laws designed to stop these perceived abuses. The Personal

Responsibility and Work Opportunity Reconciliation Act of 1996, the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, and Proposition 187 in California in 1994 are all responses to the perception that immigrants abuse public benefits. The Antiterrorism and Effective Death Penalty Act of 1996 sought to address the problem of asylum abuse.

Much of today's debate concerning immigration in the United States centers on the perception of migrants as social or economic burdens. However, it is far from clear that they are either. There have been numerous attempts to estimate the costs and benefits of immigration. Invariably, the results prove highly controversial and are challenged on conceptual, methodological, or philosophical grounds. For example, three recent studies by Donald Huddle, Jeffrey J. Passel, and the Center for Immigration Studies [CIS] estimated the net fiscal costs of providing public services to immigrants. According to Huddle and CIS, immigrants receive more in government benefits than they pay in taxes; Passel found the opposite (Vernez & McCarthy 1996:54). The recent National Research Council study found that under most scenarios, the long-run fiscal impact of immigration is strongly positive at the federal level, but substantially negative at the state and local levels. The federal impact is shared evenly across the country, but negative state and local impacts are concentrated in those states that receive most of the new immigrants, thus incurring net fiscal burdens for native residents of these states while residents of most states reap net fiscal benefits (National Research Council 1997).

The National Research Council study also found that immigration produces net economic gains for domestic residents. Immigrants increase the supply of labor and help produce new goods and services. However, as they are paid less than the total value of these new goods and services, domestic workers as a group gain (National Research Council 1997:S-3). However, there may be losers as well as gainers among different groups of U.S. residents. Along with immigrants, the gainers are owners of productive factors that are complementary with the labor of immigrants whose incomes will rise. Consumers who buy goods and services produced by immigrant labor also benefit. The losers may be less-skilled domestic workers who compete with immigrants and whose wages will fall (National Research Council 1997:S-4).

> The evidence points to the conclusion that immigration has had a relatively small adverse impact on the wage and employment opportunities of

> competing native groups. This effect does not appear to be concentrated in the local areas where immigrants live, but instead is dispersed across the United States. This dispersal comes about in part because competing native workers migrate out of the areas to which immigrants move (National Research Council 1997:S-5).

Overall, in the massive and complex U.S. economy, immigration is unlikely to have a very large effect on relative earnings or gross domestic product *per capita*. The impacts of immigration on the economy are relatively modest. The domestic gain may be on the order of $1 billion to $10 billion per year. Although this gain may be modest relative to the size of the U.S. economy, it remains a significant positive gain in absolute terms (National Research Council 1997:S-5).

Attempts to draw empirical conclusions about the relation between immigration and crime rates founder on problems of measurement. Crime rates measured from the 1960s show no obvious link with trends in immigration. Studies at the local level have found no association of immigration concentrations with crime rates except high rates of nonviolent crime near the borders (National Research Council 1997:S-10).

Hostage

The fifth category identified by Weiner is the holding of migrants as hostages, creating risks for the sending country, as when Iraq used Westerners living in Iraq as shields against armed attack during the Gulf War. This situation has not applied to the United States as a receiving county of immigrants and, therefore, is beyond the scope of this paper.

RELATIONSHIP BETWEEN IMMIGRATION, FOREIGN POLICY AND NATIONAL SECURITY

Immigration, foreign policy, and U.S. national security are closely intertwined. Immigration policy could be changed according to circumstances, but always with the larger goal of advancing U.S. national security. Foreign policy often has used immigration as a tool to advance U.S. national security. Emigration from communist enemies was promoted with the goal of destabilizing those countries; it was discouraged from repressive Cold War allies to avoid U.S. association with a country's policies that forced its own people to flee. The activities of immi-

grants also can change perceptions of national security and thus impact foreign policy. U.S. foreign policy also can unintentionally cause migratory movements; alternatively, migratory movements can affect foreign policy by creating humanitarian crises that require a response or national security threats resulting from large numbers of migrants arriving in a short period of time.

Resulting Migratory Movements

The most prominent examples of U.S. foreign policy-induced migratory movements occurred during the Cold War era. To advance the national security goal of preventing the spread of communism, U.S. intelligence services engaged in a campaign to encourage defections from behind the Iron Curtain as a means of destabilizing communist regimes. In the 1950s, the Voice of America's extensive coverage of stories of escape and consistent contrasting of the horrors of life behind the Iron Curtain to the attractions of the West was at least partially responsible for the continuing movement of escapees into the West (Loescher & Scanlan 1986:34,36).

Similarly, the United States encouraged emigration from Cuba as an essential part of a much broader set of U.S. policies that sought first to roll back and then to prevent the spread of the Cuban Revolution (Zolberg, Suhrke & Aguayo 1989:188). At the signing of the Immigration Act of 1965 in front of the Statue of Liberty, President Johnson said, "I declare this afternoon to the people of Cuba that those who seek refuge here in America will find it" (Dominguez 1992:41). In response to the exodus of Cubans from Mariel in 1980, President Carter declared, "We'll continue to provide an open heart and open arms to refugees seeking freedom from communist domination and from economic deprivation brought about primarily by Fidel Castro and his government" (Dominguez 1992:45).

United States policies toward immigration from Cuba demonstrate that immigration policy depends on the perception of its effect upon U.S. national security. During the Cold War, when preventing the spread of communism from Cuba into the Western Hemisphere was a primary foreign policy goal, Cuban emigration was encouraged. Cubans arriving in the United States were automatically treated as refugees and enthusiastically welcomed. With the end of the Cold War, the collapse of the Cuban economy, and the inability of Cuba to export revolution to countries adopting free market economic policies and democratic political reforms,

Cuban immigration is not viewed as a national security concern. Without the overriding Cold War national security concerns that previously encouraged and welcomed Cuban migrants, the domestic political concerns advanced by Florida's political leadership gained primacy and brought about a drastic change in U.S. policy. The exodus of Cubans in 1994 resulted in an agreement between the United States and Cuba wherein the United States agreed to increase the quota for Cuban immigrants to 20,000 per year and Cuba agreed to prevent undocumented emigrants from leaving.

However, not all migratory movements caused or contributed to by U.S. foreign policy actions are by design. Generally, migrant flows occasioned by U.S. foreign policy were accidental, reflecting a historic lack of attention to migration from the makers of foreign policy.

The massive resettlement of Indochinese in the United States from 1975 on—a by-product of the Vietnam War—provides a dramatic example of the unanticipated immigration consequences of foreign policy (Zolberg 1995:129).

Because of U.S. political, economic, and military involvement from the mid-1950s through 1975 in South Vietnam, our recruitment and training of agents in Laos, and our intensive bombing campaign in Cambodia, the United States felt a profound sense of obligation to the hundreds of thousands of Indochinese who feared for their safety once Communist governments came to power in these countries. The U.S. rescue operation that began with the 1975 fall of South Vietnam became a long-term international commitment that by 1986 had resulted in the resettlement of some 1.5 million Indochinese, more than 750,000 of whom came to the United States (Loescher & Scanlan 1986:121).

United States Central America foreign policies also are cited as a cause for emigration. As the dominant foreign actor in Central America for more than one hundred years, the United States intervened militarily on numerous occasions and supported repressive governments. United States-owned businesses have been dominant in the region, and U.S. trade, aid, and development policies have been instrumental in the area's economic development. Whether one takes the position that the outpouring of people from El Salvador and Guatemala in the 1980s was a refugee movement from brutal militaries supported by the United States, economic migration of people seeking employment opportunities, or a combination thereof, there can be little disagreement that U.S. policies toward the region added considerably to the incentives for migration.

In the 1980s a stated rationale for U.S. policy towards Central America was to prevent the movement of migrants to the United States. President Reagan stated in June 1983 that if the United States were to acquiesce in the establishment of a "string of anti-American Marxist dictatorships" in Central America "the result could be a tidal wave of refugees—and this time they'd be feet people, not boat people—swarming into our country seeking a safe haven from communist repression to the south" (Loescher and Scanlan 1986:192).

The use of U.S. foreign policy in an attempt to prevent emigration from Central America in the 1980s was not unique. In response to Haitian migration to the United States, the United States and Haiti reached an agreement in 1981 permitting the interception of boats leaving Haiti by United States vessels as a condition for Haiti receiving U.S. aid (Zolberg 1995:145). In the wake of the 1991 military coup that overthrew the government of President Aristide, thousands attempted to flee Haiti. President Bush invoked the 1981 agreement and over the next sixteen months 30,000 Haitians were interdicted at sea and diverted to either Guantanamo Bay or Haiti.

The *bracero* program between the United States and Mexico is an example of foreign policy unintentionally stimulating a nonrefugee migration to the United States. Bilateral agreements during both World Wars provided that Mexicans could come to the United States for temporary work to meet manpower shortages. The World War II agreement developed into the *bracero* program that continued until 1964. "The *bracero* program is generally agreed to have stimulated permanent legal immigration by temporary workers and their families who acquired permanent legal status, as well as illegal immigration by those who chose to migrate unlawfully along pathways and networks established by legal temporary workers" (Teitelbaum 1985:31).

U.S. foreign policy—political, military, and economic—was instrumental in the migration of Dominicans to the United States. From 1961 to 1966 the United States sought to limit political tensions in the Dominican Republic where government instability was seen as an opportunity for radical revolution. The United States supported efforts to remove dictator Rafael Leonidas Trujillo. In 1965, the United States intervened militarily and occupied the country for seventeen months, in many respects governing the Dominican Republic during this period (Mitchell 1992:101). After Trujillo was deposed, Dominican emigration to the United States increased markedly as the United States believed a liberal immigra-

tion policy would reduce urban unemployment and political pressures. The reestablishment of U.S. sugar quotas in 1982 subsequently wreaked havoc with the Dominican economy; total export tonnage to the United States dropped from an average of 815,335 tons for the period 1975 to 1981 to about one-fourth that level at the end of the 1980s (Zolberg 1995:153). The economic hardship resulting from U.S. sugar quotas led to a doubling in the demand for visas and expanding Dominican migration to the United States.

Another important foreign policy tool impacting upon immigration is the United State's symbolic position as the world's preeminent immigration country. The significance of this factor for foreign policy was probably most apparent in comparison with the former Soviet Union's tradition of emigration. Our immigration tradition has a privileged place in American myth and national self image that is reflected in the positive image the United States projects abroad of national generosity, attractiveness, and toleration. This image is one of the most potent but least appreciated foreign policy assets of the United States (Miller & Papademetriou 1983:166). Not surprisingly, a consequence of this image projected abroad is its magnet effect upon potential migrants throughout the world that certainly has contributed to increased immigration (Miller & Papademetriou 1983:166).

Foreign Policy Responses

The effect of immigration on the foreign policy of a receiving country is determined by a number of considerations: if the numbers of immigrants are small or they are otherwise easily assimilated into society, the impacts on the foreign policy of the host country are likely to be small; if immigrants gain entry through the appropriate legal processes, the effect on foreign policy also may be negligible. However, if the receiving country perceives that either the level of immigration is too high or that substantial numbers of immigrants are entering the country outside its legal framework, then an entire range of foreign policies may be implemented to reduce immigration. The United States has availed itself of many of these foreign policy options.

Unauthorized migration is generally the result of a combination of "push" and "pull" factors. The pull factors include the prospects of employment and better wages, freedom, physical security, the opportunity for easy remittal of earnings to home countries, and ineffective immigration enforcement. Push factors include lack of employment, poor wages and working conditions, separation from family members, civil conflict, and political, social, and religious repression (U.S. Commission on Immigration Reform 1994:174).

Policymakers have begun to consider the impact of trade, foreign aid, and investment strategies on push factors of emigration. However, much remains to be done in this area.

Economic Policy Responses

The United States also has used trade policy to influence emigration. The Jackson-Vanik amendment to the Trade Reform Act of 1974 originated in response to the Soviet Union imposing an "education tax" that required Soviet Jewish emigrants to pay compensation to the state for the costs of higher education. Jackson-Vanik, passed in December 1974 tied trade benefits for Communist countries, including "most favorable nation" tariff treatment, credit, credit guarantees, and investment guarantees, to the removal of obstacles to emigration (Loescher & Scanlan 1986:93). However, Jewish emigration from the Soviet Union fluctuated as a function of the general state of relations between the superpowers (Zolberg 1995:137).

The North American Free Trade Agreement [NAFTA] included provisions for the temporary movement of personnel between the signatory countries. NAFTA had the effect of establishing an additional nonimmigrant category of professionals permitted to enter the United States temporarily. Similarly, the Uruguay round of the General Agreement on Tariffs and Trade [GATT] for the first time included a General Agreement on Trade Services that provided for easier entry for investors, managers, executives, and other professionals. Perhaps more importantly, the effect NAFTA would have on immigration became a major part of the debate. Opponents claimed the dislocations caused by NAFTA, particularly in rural areas of Mexico, would lead to an increase in illegal immigration. Proponents argued that NAFTA would stimulate Mexico's economy, increase jobs and wages, and thereby reduce critical push factors of emigration. The effect of trade policy on immigration thus was expressly acknowledged.

The recommendations of the Commission for the Study of International Migration and Cooperative Economic Development [the Asencio Commission] makes clear the importance of trade and investment policies to emigration to the United States. Mandated by the Immigration Reform and Control Act of 1986 to examine the conditions in countries that contribute to unauthorized migration to the United States and to explore mutually beneficial, reciprocal trade and investment programs to alleviate such conditions, the Asencio

Commission stated the problem directly, "the issue for many countries is stark: they either export goods and services to create jobs at home, or they export people" (Commission For The Study of International Migration and Cooperative Economic Development 1990:xvi).

The Commission was equally clear in its recommendations to solve the problem of unauthorized immigration. It found that a program of trade and investment directed toward the long-term alleviation of push factors in migrant-sending countries in the Western Hemisphere would increase political stability in the region and increase the markets for U.S. exports by reducing unauthorized immigration. Among its principal recommendations was NAFTA. Also recommended were accelerating the Caribbean Basin Institute [CBI] by easing limitations on beneficiary products, revitalizing the Central American Common Market, encouraging exports of manufactured goods with quota allocations for textiles, apparel, and steel to be shifted in favor of Mexico and CBI beneficiary countries, improving access to U.S. markets for sending country's agricultural products (including partial restoration of Caribbean Basin sugar quotas pending a return to a free market situation), coproduction strategies, increased investment, and support for technology transfers and job creation through Section 936 of the Internal Revenue Code for CBI countries. Although movement has been slow on many of the Asencio Commission's recommendations, it is readily apparent that immigration to the United States is now an important consideration in the making of U.S. foreign economic policy. Immigration considerations also entered the debate on the CBI, financial assistance to Mexico after the 1994 peso devaluation, and the Border Industrialization Program with Mexico (Diaz-Briquets 1995:175).

In conjunction with trade and investment policies, foreign assistance can be used to achieve immigration-reducing objectives. The Asencio Commission recommended involving local organizations in project preparation of foreign assistance programs, assessment of the potential immigration impact of development projects, evaluation of their actual impact after implementation, and channeling of more funds through private voluntary organizations.

However, trade, investment, and foreign assistance policies that seek to reduce emigration pressures must confront the dilemma that over the short term these policies are likely to increase emigration (Diaz-Briquets 1995:174). Conditioning trade and investment policy and foreign assistance on short-term reductions in immigration will undercut their potential

long-term success. Only over time will economic development reduce demographic pressures, improve labor conditions, and result in rising wages and living standards so that people do not feel compelled to emigrate. Spain, Japan, Italy, and Malaysia are all examples where economic development transformed migrant-sending countries into countries that attract immigrants from other nations (Diaz-Briquets 1995:175). However these countries also are proof that the success or failure of development efforts is principally determined by the domestic policy choices a country makes.

Military Responses

Immigration concerns also have affected the use of the U.S. armed forces. In response to perceived immigration crises, United States forces began interdicting Haitians at sea in 1981. By 1993, more than 60,000 Haitians were interdicted and returned to Haiti or taken to camps at the U.S. military base in Guantanamo. In 1994, the U.S. government, in a major policy reversal, began interdicting Cuban rafters attempting to reach South Florida by sea. In fear of another Mariel type exodus, more than 35,000 people were picked up by the U.S. Coast Guard in the summer of 1994 (Newland 1995:197). Immigration fears were used to justify military support to Nicaraguan *contras* and the government of El Salvador throughout the Central American crises of the 1980s.

Concerns over unauthorized immigration have contributed to the militarization of the border between the United States and Mexico, although this was motivated primarily by concerns with drug smuggling. Military rhetoric, tactics, strategy, technology, equipment, and personnel are now part of the effort to staunch the flow of unauthorized immigration. Helicopters, intrusion detection and surveillance hardware, advanced communications systems, and increases in border patrol agents and facilities have been used in the effort to decrease unauthorized immigration (Dunn 1996:44-5). The United States also provided funding to Mexico for a land interdiction program to prevent Central Americans from reaching the United States. As a result, Mexican apprehensions and deportations of undocumented immigrants jumped from 14,000 in 1988 to an estimated 160,000 in 1990 (Dunn 1996:95).

The most prominent use of U.S. military force in response to a perceived immigration crisis was the intervention in Haiti in September 1994. On May 19, 1994, President Clinton included among U.S. interests that would justify an intervention in

Haiti the likelihood of a "massive outflow" of refugees to U.S. shores. Four days before the intervention the President said:

> Three hundred thousand more Haitians, 5 percent of their entire population, are in hiding in their own country. If we don't act, they could be the next wave of refugees at our door. We will continue to face the threat of a mass exodus of refugees and its constant threat to stability in our region, and control of our borders (Newland 1995:202).

A number of arguments have been advanced to justify military intervention in refugee-producing situations. For example, human rights violations by a government against its citizens violates the sovereignty of the people and the offending government cannot thereafter claim that intervention violates its sovereignty because the real violation of sovereignty was the government's mistreatment of its own citizens (Keely 1996:1060 quoting Reisman). Human rights violations carried out or tolerated by a government or carried out when a government is incapable of stopping it almost invariably lead to internal displacement and eventual refugee flows across borders (Keely 1996:1060). The threat of refugees to the stability of receiving countries provides an argument justifying self-defensive actions under the U.N. charter. "Provoking refugee flows can rise to the equivalent of aggression" (Keely 1996:1060 quoting McCalmon). "A country may defend itself by forceful intervention in another state to end human rights violations and prevent imminent refugee flows that threaten its security (Keely 1996:1060).

Such theories have been used to support interventions authorized by the United Nations Security Council pursuant to Chapter VII of the U.N. Charter. In 1991 and 1994, the Security Council invoked transborder refugee flows to justify international action in Iraq and Haiti respectively. The Security Council authorization of U.S. intervention in Somalia in 1992 took note of the large numbers of refugees displaced by the conflict and called for repatriation of refugees as part of the U.N. operation (Dowty & Loescher 1996:63). U.N.-authorized interventions in Rwanda in 1994 and in Kurdish areas of northern Iraq in 1991 both explicitly took note of the large numbers of refugees and displaced persons created by those crises (Dowty & Loescher 1996:65).

Established foreign policy agencies of the United States could be used in preparation for such immigration emergencies as those of the Vietnamese boat people and the large numbers fleeing periodically

from Cuba, Haiti, and Central America. Most humanitarian emergencies that generate large-scale movements of refugees and other displaced persons are predictable to some degree. United States intelligence services and the Department of State are well placed to analyze events in potential migrant-sending countries and make recommendations to prevent massive emigrations. Preventive actions after identification of a potential large-scale emigration of people can involve a wide array of strategies ranging from diplomacy, to economic sanctions, to military intervention (U.S. Commission on Immigration Reform 1997:13). Emergency responses often involve the use of military forces for rescue operations and military bases for housing displaced persons.

Multilateral Approaches

Controlling immigration to the United States calls for a multilateral approach. Although a fundamental aspect of sovereignty is the control of borders and the unilateral right to determine who may enter the state, transportation and communication advances, long-established migration patterns, and increasingly interdependent political and economic relations mean that only a multilateral approach can address current immigration concerns effectively.

Because there are numerous problems related to immigration that can only be addressed effectively through multilateral solutions, we should expect, and hope, to see increased approaches of this nature. Problems that will require multilateral approaches for effective resolution include the smuggling of peoples across the border, the deportation of criminal aliens in a manner to insure that they do not return, harmonization of exit and entry rules, the prediction, prevention, and response to immigration emergencies, support for human rights and democracy building in potential migrant-sending countries, peacekeeping operations, programs aimed at reconstruction of sending countries following civil wars and civil conflict, resettlement of refugees, and coordination of efforts between sending and receiving countries to address pressures for unauthorized migration and environmental degradation.

Although United States responses to immigration have been largely unilateral, there are significant historical examples of bilateral/multilateral approaches to immigration problems: the "Gentlemen's Agreement" with Japan in 1907; agreements with Mexico during both World Wars and the *bracero* agreement; migration agreements in 1965, 1984, and 1995 with a Cuban government with which the

United States did not have diplomatic relations; the 1981 agreement with Haiti; and the Comprehensive Plan of Action in 1989 to address the pushback of Indochinese refugees. Most of these agreements were reached *ad hoc* in response to an immediate crisis. Unfortunately, they did not result in a coherent policy that could be applied in future situations.

Today the United States engages in a number of multilateral regimes concerned with refugees and migration. The working group of the U.S. Mexico Binational Commission promotes bilateral dialogue on migration through recurring communication and exchange of information and addresses mutual migration problems through cooperative mechanisms. Mexico's consultation with the Asencio Commission and lobbying by Mexican authorities in the United States on political and economic matters, which did not occur prior to the NAFTA negotiating process, shows an increasing acceptance of bilateral approaches to issues that affect both countries. NAFTA created a number of institutional arrangements that have breathed new life into established consultation groups. Both sides of the joint Border Liaison Mechanism have taken steps to reduce smuggling of immigrants. The bilateral engagement with Mexico on migration issues that began before NAFTA has increased since its passage.

Within the Western Hemisphere there is now an established regional mechanism for discussion of migration issues. In 1996, a multilateral approach to Western Hemisphere migration issues, known as the Puebla Process, was begun with the Regional Conference on Migration held in Puebla, Mexico. Canada and the Central American states joined the United States and Mexico. In recognition that a comprehensive and objective approach to the origins, manifestation, and effects of regional migration would contribute to a better understanding of this phenomenon, the participating governments entered into a series of agreements on a wide range of issues affecting migration. These include promoting economic and social development, encouraging states with common borders to establish mechanisms for dialogue at various levels of government, and preventing the trafficking in migrants.

At the group's Second Regional Conference on Migration in March 1997 in Panama, the parties agreed to establish the Regional Consultation Group on Migration and adopted the Plan of Action designed to insure the timely achievement of agreements reached at the 1996 meeting. Also participating in the Panama meeting were such multinational organizations as the International Organization for Migration [IOM], the Economic Commission for Latin America and the Carib-

bean, the Inter-American Development Bank, and the Office of the United Nations High Commissioner for Refugees [UNHCR].

The Puebla Process is an important development in addressing Western Hemisphere migration concerns because the established organizations dealing with migration issues were not well equipped for the task. UNHCR has as its primary mandate the protection of and assistance to refugees. The International Organization for Migration has a mandate to assist all types of migrants but focuses on the provision of transport to individuals who are being resettled or who are returning to their home countries. The complex circumstances that characterize many mass movements do not fit well with either organization's current mandate or capacities (U.S. Commission on Immigration Reform 1994:179).

Environmental degradation, droughts, floods, and famines compel people to flee across international borders. Rapid population growth in migrant-sending countries and measures leading to economic development have led to considerable environmental degradation and erosion of natural resource bases. There already have been mass migrations within and between countries as a result of desertification, floods, and threats of inundation from rising sea levels (Weiner 1992:92-93). Finding effective solutions to these problems may require multilateral approaches.

A study of Mexico has found that the inability to farm because of land degradation or desertification can result in rural unemployment and general poverty that in turn can lead to migration (Schwartz & Notini 1994:18). The Mexican government also has observed that there is a strong tendency for people to migrate from the arid and semi-arid areas of the country that contain twenty million inhabitants with scarce possibilities for work (Schwartz & Notini 1994:18). There has been insufficient research, education, and training in Mexico to remedy problems caused by existing agricultural practices. The relationship between migration and soil degradation is complex and may exacerbate the destruction of fragile ecosystems in Mexico. The costs of migration to a family may also be less than the environmental investment needed to increase the productivity of farmland (Schwartz & Notini 1994:28).

Deforestation in Haiti has led to soil erosion that has contributed to the massive emigration from that country (Mathews 1989:168). Traced through its effects on agriculture, energy supply, and water resources, tropical deforestation impoverishes about one billion people. This

pattern is endemic throughout Central and South America (Mathews 1989:165). U.S. policies to limit immigration will have to take into effect such environmental impacts. Policies designed specifically to prevent environmental degradation in potential migrant-sending countries may be necessary to control migration.

IMMIGRANT/ ETHNIC GROUP INFLUENCE

The role of immigrants and ethnic groups in the foreign policymaking process of the United States has engendered much debate. The idea that the ethnic composition of the United States is critical in the making of its foreign policy was expressed by Nathan Glazer and Daniel P. Moynihan (1975:23):

> Without too much exaggeration it could be stated that the immigration process is the single most important determinant of American foreign policy. This process regulates the ethnic composition of the American electorate. Foreign policy responds to that ethnic composition. It responds to other things as well, but probably first of all to the primal factor of ethnicity.

This argument subsequently was described as "plausible" by a member of the Senate Foreign Relations Committee (Mathias 1981:979). It also has been said that "domestic ethnic pressures on foreign policy formulation loom large in the United States, affecting foreign policies toward settings as diverse as Northern Ireland, the Turkish-Greek conflict, the Middle East, Cuba, Mexico, Haiti, and Poland, to name only a few of the obvious cases" (Teitelbaum 1984:441). Charles B. Keely identified three reasons why the activities of ethnic lobbies are suspect: those influential in foreign policymaking see ethnic lobbies as an obstacle; ethnic groups are perceived as single-issue lobbies; and nativists (defined as an those in intense opposition to an internal minority on the ground of its foreign connections) consider lobbying activities on part of a foreign government as un-American (Keely 1995:231-32).

Equally persuasive arguments are made that immigrants and ethnic groups have only a limited impact on the making of U.S. foreign policy (Gerson 1977:55):

> Ethnic pressures on foreign policies, with accompanying claims of success or failure, have

> led to false beliefs at home and abroad that the policies were based on domestic ethnic considerations. Seldom, if ever, have major U.S. foreign policy decisions been affected by *purely* ethnic considerations.

Similarly, an examination of the effect that immigrant groups had upon U.S. foreign policy between the two World Wars found that ". . .the impact of the one upon the other has been greatly exaggerated" (Jonas 1990:67).

> Despite being criticized, they are not indisputably a detriment to or subversive of the national interests. They are not all powerful or a force out of control. They can be an effective check, and provide viewpoints that may be otherwise overlooked (Keely 1995:241).

An examination of particular cases reveals that while ethnic lobbies may influence U.S. foreign policy, several factors constrict such influence. An ethnic lobby may have success in the foreign policymaking process when the policy in question affects the homeland of the particular ethnic group, where the issue involved does not threaten U.S. national security, where there is no equally effective lobbying effort against the proposed policy, or where the proposed policy is within the mainstream of overall U.S. foreign policy.

Much has been written of the influence of the Greek-American lobby in contributing to the U.S. arms embargo imposed on Turkey after it invaded Cyprus in 1974. "[T]he Greeks, with a powerful ethnic lobby mobilized for their cause, held the upper hand in Washington" (Mathias 1981:987-88). One newspaper columnist, in a not untypical opinion, deplored the "ethnic foreign policy making" that culminated in the arms embargo as a "rising menace" tantamount to communism in its potential destabilization of U.S. foreign policy (Hicks & Couloumbis 1977:86).

However, these responses overlooked critical factors that led to the imposition of the arms embargo. Turkey had violated the Foreign Military Sales Act by using U.S.-supplied arms in their invasion of Cyprus. Greece, like Turkey, was also a member of NATO. The Greek lobby also had merit on its side, the invasion of a sovereign country violates international law. Congressman John Brademas, a leading congressional proponent of the embargo, said:

> If we members had not been able to put together a compelling case, in terms of law, policy and

> morality, we would not have been effective. But on the other hand, without the kind of support we got from the Greek community, our case might not have been sufficient to win the day (Hicks & Couloumbis 1977:86).

Those who claimed that the Greek lobby was the determining factor in the congressional decision to cut off military aid to Turkey are incorrect (Hicks & Couloumbis 1977:110). While the Greek lobby clearly had an impact on the decision to impose the arms embargo, it would not have prevailed had its position not been consistent with U.S. law and foreign policy principles. In any event, the embargo was gradually relaxed in the two years immediately following its imposition and was repealed entirely in 1978.

Another major ethnic entity credited with notable success in influencing U.S. foreign policy is the Cuban lobby, which has focused primarily on toppling Castro and reversing the revolution (Keely 1995:237). "For many years a key consideration among Washington policy makers addressing U.S.-Cuban relations has been the strong opposition of the Florida congressional delegation—pressed by the large and influential Cuban constituency in the state—to any moves toward normalization unless they are balanced by major changes in Cuban foreign and domestic policies" (Teitelbaum 1985:47). No other immigrant group to the United States has been able to use its opposition to its home government to influence U.S. foreign policy as effectively (Newland 1995:204).

A Bush administration official said of the role of the Cuban-American National Foundation, the voice of hard-line Cuban-Americans, "[t]he foundation has had a chilling effect on the debate. Anytime anyone starts to think creatively about Cuba we're told: What do you want to do, lose South Florida for us?" (Newland 1995:205).

However, even a well-financed and well-organized lobby like the Cuban-Americans is successful because their goals are consistent with larger U.S. foreign policy interests. Their anticommunism was well matched to the U.S. policies of the Cold War era. A communist regime in Cuba was seen as a major threat to U.S. national security and overthrowing the Castro government was a major U.S. foreign policy goal throughout the 1960s. Even after the collapse of the Soviet Union, the United States still treats Cuba as an implacable enemy and continues the economic embargo.

With the resulting changed post-Cold War political environment, immigration from Cuba no longer is seen as advancing U.S. national security. This diminishes the effectiveness of the Cuban lobby. The 1994 interdiction of fleeing Cubans at sea by the U.S. Coast Guard, and the subsequent agreement in 1995 between the United States and Cuba to prevent people from leaving Cuba would have been unthinkable ten years earlier. Passage of the Helms-Burton law, which tightens the economic embargo against Cuba, was aided by the outrage provoked by the shooting down by the Cuban Air Force of two planes operated by the Miami exile group Brothers To The Rescue. As long as the Castro regime denies its citizens basic human rights and refuses to democratize, there will remain a substantial congruence of interests between U.S. foreign policy and the goals of hard-line Cuban-Americans that will insure a degree of success in their lobbying effectiveness. However, without the national security threat presented by Cuba during the Cold War, the lobby's effectiveness will be diminished and counterbalanced by other competing interests.

The Jewish-American community's influence on United States policy toward Israel represents another effective ethnic lobbying effort. "The American Israel Public Affairs Committee [AIPAC], the Jewish-American community's most powerful voice is often used as an example to emulate among other ethnic lobbies in the United States. Although there are many policy differences between the United States and Israel, the United States government has been extraordinarily supportive of Israeli government policies. AIPAC is held responsible for most of this support" (Keely 1995:236).

However, the influence of the Jewish-American lobby does not alone explain the strong U.S. support for Israel. Israel remains the United States' most loyal and only democratic ally in a volatile region of the world of great strategic importance to the United States. Most analysts believe that support for Israel is in the interest of the United States. Mathias (1981:993) described the relationship between the lobbying activities of Jewish-Americans and support for Israel as being in the U.S. national interest:

> This is not to suggest that Congress supports Israel for no better reason than fear of the Israel lobby; on the contrary, I know of few members of either house of Congress who do not believe deeply and strongly that support of Israel is both a moral duty and a national interest of the United States.

Perhaps the most controversial example of the influence of the Jewish-American community was the passage of the Jackson-Vanik amendment to the Trade Reform Act of 1974. Because it believed human rights concerns would interfere with its policy of détente, the Nixon administration consistently eschewed human rights intercession with the Soviets unless domestic political pressure forced it to act (Loescher & Scanlan 1986:91-92). However, many members of the Jewish community in the United States and key members of Congress feared that détente was being pursued without adequate attention to human rights concerns.

The effects of Jackson-Vanik on at least the short-term national security interest of U.S-Soviet relations is widely seen as negative. Jackson-Vanik's linkage of nondiscriminatory trade with free emigration so angered the Soviets that they canceled the 1972 Soviet-American trade agreement, stopped payment on World War II lend-lease debts, and reduced the number of Jews permitted to emigrate (Mathias 1981:995). Jackson-Vanik strained overall U.S.-Soviet relations and left the impression that a gamble was taken for the sake of human rights and emigration goals without regard for other, and possibly larger, issues of geopolitical stability (Keely 1995:237).

Ethnic groups' influence on U.S. policy generally is limited to the narrow objective of securing access to the United States for members of the nationality or ethnic group abroad (Miller & Papademetriou 1983:180). According to Teitelbaum and Weiner (1995:26):

> American ethnic groups can claim considerable success, since the 1960s at least, in the framing and resolution of public debate about the criteria for immigrant and refugee admission, the elements of law underlying control of immigration, and the feasibility and seriousness with which immigration enforcement efforts have been granted.

Examples of this influence include the Jackson-Vanik Amendment, the Morrison-Lautenberg Amendment that lowered the definitional barriers for "refugees" only for Soviet Jews and Evangelical Christians, the Refugee Act of 1980, the Cuban Adjustment Act of 1966, and "diversity" visas pursuant to the 1990 Immigration Act.

Despite the fact that ethnic groups in the United States traditionally have pursued policies consistent with U.S. national interests, there appears to be much consternation about the role that post-1965

Immigration Act immigrants, largely Latin American and Asian, will play in the foreign policymaking process. Mexican-Americans, for example, have not indicated greater interest than other ethnic groups in issues related to their homeland or Latin America generally, and those who have long been in the United States exhibit the same reduction in ethnic group identity as any other group. Mexico does not appeal to U.S. citizens of Mexican origin to support Mexico's interests in this country. Mexican-American attitudes towards immigration do not appear to be determined by concern for Mexico. Nor do Mexican-Americans view the problems facing the United States substantially different than the general public (Glazer 1985:212-14). There is no evidence that the retention of Mexican cultural practices has prevented Mexican-Americans from identifying with the U.S. political system (de la Garza 1985b:238). U.S. culture and politics continue to be powerful assimilative forces.

Mexican-American participation in the U.S. political process is remarkably similar to that of other ethnic and immigrant groups. It is affected by the same forces: education, income level, and the desgree of participation in professions from which political leaders are drawn. These factors have served to limit the political influence of Mexican-Americans, as was true of other immigrant and ethnic groups in the past (Glazer 1985:224). As Mexican-American naturalization rates increase and Mexican-Americans increase their role in the policymaking process, their activities will come under increased scrutiny. However, there is nothing to indicate that the role of Mexican-Americans in the policymaking process will be different in any material respect from other immigrant groups and their descendants.

Immigrants from Latin America or Asia are unlikely to coalesce into monolithic groups. The political differences between Cuban-Americans and Mexican- Americans, for example, means that a broad-based Latin American ethnic lobby is unlikely to form. Serious tensions exist between Mexican-Americans and Mexican émigrés (de la Garza 1985a:97). Similarly, historical differences between Koreans, Japanese, Chinese, and Vietnamese makes a broad Asian-American political lobby unlikely. Successful integration into U.S. society is a prerequisite to successful influence on public policy; however full integration may diminish the interest of ethnic groups in their culture or countries of origin (Teitelbaum & Weiner 1995:26).

SENDING COUNTRY INFLUENCE

The mere presence of an immigrant group in the United States might cause that group's home country to insert itself into the foreign policymaking process of the United States when issues affecting its nationals are involved. Although Mexican government policy until the mid-to-late 1980s was "to have no policy" on the issue of illegal immigration to the United States, Mexico still negotiated the World War I, World War II, and *bracero* employment agreements with the United States. In 1982, in response to Senate passage of the Simpson-Mazzoli immigration bill by a vote of 80 to 19, the Mexican Senate adopted a strongly worded resolution on "this grave matter that negatively affects our good neighbor relations," expressing its alarm and concern for the repercussions that would impact both countries if the Simpson-Mazzoli legislation were passed. Undocumented Mexican migration was called a "transcendent matter that should not be considered from a unilateral perspective, but rather should be treated from a bilateral and even multilateral perspective" (Teitelbaum 1984:449).

In 1984, then Mexican President Miguel de la Madrid wrote:

> The situation of Mexican migrant workers in the United States has been, and continues to be, of special interest [to Mexico]. We have reiterated our support for the rights and interests of Mexican nationals abroad. We have no intention of meddling in the legislative processes of the United States. But we express our concern over measures such as the Simpson-Mazzoli bill which could affect the social, labor, and human rights of numerous Mexicans, whose daily work and efforts represent considerable benefit to the U.S. economy (Teitelbaum 1985:32-3).

As Mexico began to liberalize its economy and play a more active role in world economic affairs, it also increased its engagement with the United States on migration issues. Today the Mexican government pursues three major objectives in regard to migration: protection of the rights of emigrants; avoidance of abrupt changes in United States immigration policy; and recognition for Mexican migrant contributions to the United States. As emigration issues increasingly require a multilateral approach it is to be expected that sending countries will seek participation in the U.S. foreign policymaking process as it affects these matters.

One example of migrant-sending countries seeking participation in the U.S. policymaking process was the lobbying of President Clinton on immigration issues by foreign heads of state during his 1997 trip to Latin America and the Caribbean. A joint statement concerning immigration was issued with President Zedillo in Mexico. In a speech in Mexico City, President Clinton felt compelled to defend recent U.S. laws affecting immigration. In Cost Rica, the President of El Salvador, Armando Calderon Sol, proposed an amnesty for some immigrants from Central America. Central American leaders expressed concerns that the 1996 Illegal Immigration Reform and Immigrant Responsibility Act would compel the return of hundreds of thousands of immigrants from the United States, causing damage to local economies by creating strains on the job market and the loss of remittances from the United States. In both Mexico and Costa Rica, President Clinton pledged to seek a change in the Illegal Immigration Reform and Immigrant Responsibility Act of 1996 that would force illegal immigrants to return home while they waited for legal status (Bennet 1997:A6). In Barbados, Caribbean leaders offered pointed criticism of U.S. immigration policies.

The increased number of deportations of legal and illegal immigrants from the United States because of criminal convictions has resulted in increasing crime and pressures on the criminal justice systems in their home countries. Throughout Central America and the Caribbean government officials have expressed anger and frustration at a crisis they regard as caused by the United States and beyond their ability to control (Rohter 1997:A1). Several regional leaders raised this issue with President Clinton during his May trip to the region.

Some ambassadors of Asian governments to Washington have acted as bridges to their own immigrant communities and have sought to encourage their former nationals in the United States to lobby on their behalf on issues that affect the sending country. Some Asian embassies and their intelligence organizations have monitored the activities of their citizens or former citizens in the United States (Weiner 1990:194). The 1984 murder of Henry Liu in San Francisco, a Chinese-American who had written a book critical of Taiwanese President Chiang Ching-Kuo, resulted in the arrest and conviction of the former head of Taiwan's intelligence service for plotting the murder.

Both the People's Republic of China and the Republic of China have attempted to use the presence of Chinese-Americans to advance their state's interests. Both gov-

ernments take the view that overseas Chinese are migrants who retain ties to China and eventually will return home. This bond legitimizes efforts by the two Chinese governments to seek assistance from the overseas Chinese (Weiner 1990:197).

The presence of forty thousand Chinese students in the United States led the People's Republic of China to inject itself into the debate over the proposed Chinese Student Protection Act after the Tiananmen Square killings in June 1989. In vetoing the bill, President Bush expressed his hope that China would object less to his administrative action to protect the students than the vetoed legislation (Pear 1989:A24). In 1996, U.S. law enforcement agencies received evidence that the People's Republic of China planned to try to influence U.S. elections by contributing money to political campaigns. It is unclear whether such donations were made and whether any such money was laundered by Asian-Americans; congressional hearings into these allegations continue (Rosenbaum 1997:B9).

The Indian government has encouraged the Indian community in the United States to support Indian foreign policy objectives in Washington actively, seeking, for example, to persuade Congress not to provide military assistance to Pakistan (Weiner 1990:203-04).

Despite such efforts, migrants are not automatically instruments of their home countries' foreign policies. Substantial numbers of the immigrant groups in the United States from such countries as Vietnam, China, the Philippines, Korea, and Cuba fled their countries of origin as a result of persecution. Not only are they unwilling to advance the interests of their home countries, on many occasions they make up opposition political groups that pressure the United States to insist on free elections, respect for human rights, and democratic reforms in their home countries.

Foreign politicians seek political support and monetary contributions from their countrymen residing in the United States. Dominican presidential candidates campaigned in New York City during their 1996 elections. The winner Leonel Fernandez Reyna grew up in New York City. In 1978, Ecuadoran presidential candidate Jaime Roldos campaigned in New York City and in 1980, Italian parliamentary candidates vied for absentee votes in the United States. Israel may have as many as 500,000 citizens living in the United States, which would probably be the most significant case within the United States of an expatriate community's political influence (Miller & Papademetriou 1983:169-70). It is not apparent that the campaign activities of foreign politicians on U.S. soil have had

any effects on the foreign policymaking process in the United States.

Increasing nationalization rates raise the issue of dual citizenship. There is no internationally agreed-upon principle governing dual citizenship. Therefore, the effect of an individual's acquisition of another citizenship on his or her existing citizenship varies widely (Goldstein & Piazza 1996:517). For some countries, citizenship may carry with it an obligation to perform military service or pay taxes. Citizenship may be a prerequisite to property ownership, employment, social welfare benefits, or university attendance. Dual citizenship is more tolerated than explicitly accepted by both the U.S. and many other governments. The U.S. State Department notes:

> . . . while recognizing the existence of dual nationality and permitting Americans to have other nationalities, the U.S. Government does not endorse dual nationality as a matter of policy because of the problems it may cause. Claims of other countries upon dual national U.S. citizens often place them in situations where their obligations to one country are in conflict with the laws of the other (Goldstein & Piazza 1996:518).

The concern over dual citizenship is that it may weaken the allegiance or commitment of an individual to the country where he or she is naturalized. For the United States, the assimilative process advanced by naturalization may be diminished. However, should dual citizenship prove to be a problem, it could be addressed by treaty as some countries have already done (Goldstein & Piazza 1996:519).

While dual citizenship currently does not pose a problem for U.S. foreign policymaking, it is an issue that bears watching. Ireland recently changed its nationality laws to allow for dual citizenship. Colombia, Ecuador, Turkey, and Italy have done the same. In December 1996, constitutional amendments were passed that, when implemented, will allow Mexicans to naturalize in another country without automatically losing Mexican citizenship.

Immigrants and ethnic groups do influence U.S. foreign policy, but in a circumscribed manner. The success of ethnic lobbies in influencing U.S. foreign policy is limited to those circumstances where the policy in question affects the homeland of the ethnic group, where the issue involved does not threaten U.S. national security, where there is no equally effective lobbying effort against the proposed

policy, and where the proposed policy is within the mainstream of overall U.S. foreign policy. If any of these circumstances is absent, the proposed policy will likely fail.

Ethnic lobbies are part of the U.S. political scene. They are historically mainstream in their objectives. Ethnic lobbies serve as a useful voice and can even be a corrective to conventional wisdom. They have the same right to present views concerning the national interest as other Americans (Keely 1995:242). There is no reason to believe that as the post-1965 immigrant groups become more active in the policymaking process their behavior will differ from that of earlier ethnic groups.

CONCLUSION

Whether one subscribes to traditional or modern ideas of national security, it is fair to conclude that under certain circumstances immigration can pose a threat to national security. Immigration is closely intertwined with foreign policy and national security, with each acting upon and being influenced by the other. To advance national security, U.S. foreign policy has been used to stimulate or inhibit migratory movements. The historical lack of attention by foreign policy decisionmakers to immigration has resulted in unintended migration to the United States. Virtually every type of foreign policy tool—economic, military, trade, or propaganda—has been used at one time or another to respond to concerns arising from immigration.

The perception of and response to immigration by U.S. policymakers is seen in the context of U.S. national security. During the Cold War era when communism posed a clear and imminent threat, immigration policy was used to stimulate defections from communist countries and inhibit it from repressive allies. In the post-Cold War era, where no such obvious and imminent threat exists, immigration policy has become more restrictive in response to domestic political perceptions.

Immigrants and their descendants attempt to influence U.S. foreign policy in the same manner as other interest groups. However, historically their successes have been limited almost entirely to those situations where their goals were consistent with prevailing U.S. national security needs. The presence of immigrants in the United States creates situations where foreign governments become involved in attempting to influence U.S. foreign policy and immigration policy either to protect their countrymen in the U.S. or their national interests that may be advanced by the

presence of their nationals in the United States.

As advances in travel and communication make migrations increasingly easy, the ramifications of foreign policy decisions upon immigration will need more than ever to become an established part of the foreign policy decisionmaking process. The connections and implications between these issues need more focused attention. Addressing migration concerns effectively requires multilateral approaches and cooperation with international agencies.

U.S. COMMISSION ON IMMIGRATION REFORM

THE IMPACT OF THE IMMIGRATION ACT OF 1990 ON U.S. IMMIGRATION

by

Michael J. Greenwood

In this study the impacts of the Immigration Act of 1990 are estimated. The "impacts" that are the focus of the study are numbers and various shares of legal U.S. immigrants compared to an estimate of what corresponding numbers and shares would have been in 1995 and 1996 if the "old" immigration law had remained in force. The study is concerned only with part of U.S. immigration, but a large part. Refugees are eliminated from the analysis along with certain groups of immigrants whose admittance was due to a "one-time" program that is inherently impossible to model. Thus, immediate relatives of U.S. citizens, family-based restricted immigrants, employment-based restricted immigrants, and certain special immigrants are studied. In every case, principals are distinguished from derivatives, and where necessary to address a specific issue, other distinctions are made in the data, such as age, occupation, country or region of birth, adjustments by nonimmigrant entry class, new immigrants versus adjustments of status, and specific immigrant entry class

Aspects of the Immigration Act of 1990

Effective October 1, 1991, U.S. immigration law changed considerably. These changes were the result of the Immigration Act of 1990 which, while retaining the basic principles of the earlier legislation, provided the most comprehensive change in legal immigration since 1965. Data on which we base our forecasts relate to the old law. The new law has many similarities to the earlier law. For example, the new law, like the old, provides for the unrestricted immigration of certain immediate relatives of U.S. citizens. The new law places more emphasis on employment considerations, but the old occupation preferences (third and sixth) also place emphasis on the same types of considerations. Under the old law legal resident aliens were able to reunite with immediate members of their family under the second preference, and a similar preference (though expanded in terms of available visas) also is available under the new law.

Moreover, the new law provides for "diversity" immigrants and explicitly excludes from this class any natives of countries that are oversubscribed.

Several changes made by the 1990 Act are of particular relevance. Under the previous law, the annual allocation of numerically restricted visas was 270,000. The 1990 Act established a "flexible" worldwide cap on family-based, employment-based, and diversity immigrant visas. Beginning in fiscal year 1995, after a "transition" period during which the annual quota was set at 700,000 the worldwide limit is 675,000. Separate ceilings are set for each of the immigrant categories: for family-sponsored visas, 480,000; for employment-based visas, 140,000; and for diversity visas, 55,000. While immediate relatives of U.S. citizens remain exempt from numerical limitation, the number of spouses, minor children and parents of U.S. citizens are subtracted from the overall numbers available for family sponsorship. However, under no circumstances can the number of numerically restricted family-sponsored visas be less than 226,000. Therefore, if the number of immediate relatives of U.S. citizens exceeds 254,000 (i.e., 480,000 - 226,000), the flexible worldwide cap of 675,000 may be pierced.

In addition to setting a higher overall limit on admissions, the 1990 Act altered the per-country limitations used to determine how many immigrants may enter the United States each year. Previously, the per-country quota was set at 20,000 visas per year. The 1990 Act provides that family-based and employment-based visas made available to citizens of a single independent foreign state may not exceed 7 percent of the total available. Given the minimum of 226,000 family-sponsored and 140 employment-based allocations, the per-country ceiling for an independent country is raised to 25,620. Additional flexibility is provided for potential migrants by the fact that the 7 percent per-country limit is not subdivided between family-sponsored and employment-based allocations.

In many respects the new law concerning family-based immigrants is similar to the previous law. Immediate relatives of U.S. citizens remain exempt from numerical limitation. Moreover, the annual floor of 226,000 numerically restricted family-sponsored visas represents only a relatively small increase over the 216,000 available within the previous law's family-related preference categories. However, the new law makes certain provisions that should alter the mix of immigrants within the family-sponsored categories. The major change in the family-sponsored categories involves spouses, minor children and unmarried adult children of permanent resident aliens (i.e., second preference). For these immigrants, the new law increased the allotment from 70,200 to at least 114,200. Moreover, at least 77 percent of these visas are designated for spouses and minor children of permanent resident aliens and three-quarters of these are not subject to per-country limits. The other family-based categories (i.e., first, fourth, and fifth preference), either had their allocation remain essentially unchanged (i.e., fifth) or reduced by the new law.

While maintaining the strong orientation toward family reunification that characterized the 1965 Amendments, the new law accommodates more skill-based immigrants, and it provides for more source-country diversity. Prior to the 1990 Act, 54,000 visas were available for occupation-based immigrants. The new law allows up to 140,000 employment-based visas and also places more emphasis on skilled migrants within this category. The so called "diversity" immigration allocation was made available for the first time by the 1990 Act (although a relatively small number of diversity visas were allocated by means of a lottery before the new law took effect). The diversity immigrant allocations are designed to facilitate the entry of potential migrants from countries adversely affected by the 1965 law. Effective in 1995, the diversity quota is 55,000. These 55,000 visas are to be allocated to natives of a country that has sent fewer than 50,000

immigrants to the United States over the previous five years. No single country may receive more than 7 percent (3,850) of the number available worldwide. To be eligible for a diversity visa, a prospective immigrant must have at least a high school education or its equivalent and at least two years of work experience in an occupation that requires at least two years of training or experience. Diversity immigrants are therefore a kind of occupational immigrant.

Table 1 bridges immigration under the old law and immigration under the Immigration Act of 1990. Data in this table are averages for 1990 and 1991 (the last years of the old law), 1992-1994 (the three transition years of the new law), and 1995 and 1996 (the first two years during which the more or less permanent cap and quota numbers were in effect). Between 1990-1991 and 1995-1996, immigration subject to the numerical cap increased by 27.0 percent from 535,993 to 681,209. Family-based immigration increased by 16.9 percent to 528,551, whereas employment-based immigration increased by 72.3 percent to 101,418. Immigration not subject to the numerical cap fell by 7.7 percent, and in 1995-1996 accounted for 16.3 percent of total immigration compared to 21.1 percent during 1990-1991.

Whereas total immigration subject to the numerical cap increased somewhat due to the new law, many of the percentages noted above did not change markedly with the exception of the percentage increase in employment-based immigrants. Thus the Immigration Act of 1990 appears clearly to have had the effect of boosting employment-related immigration, which was one of the major objectives of the new law. This conclusion is further substantiated in the analysis provided below. However, professionals with an advanced degree (employment 2nd preference principals) have declined steadily since the first year that the new law was in effect: 58,401 in 1992, 29,468 in 1993, 14,432 in 1994, 10,475 in 1995 and 8,870 in 1996. This pattern suggests a pent-up demand for entry by such individuals that was relieved the Immigration Act of 1990.

Data and Methodology

As noted above, the goal of this study is to determine the extent to which the Immigration Act of 1990 changed the number and composition of various types of legal U.S. immigrants relative to what they would have been if the former law remained in effect. The "old law" was operational from FY 1968 through FY 1991 and thus allows the development of a considerable history of legal entrants. Because data are available on each legal resident alien accepted by the United States for FY 1972 through FY 1991, we are able to generate 20 annual observations for any cross classification that is possible given the information reported in the Immigration and Naturalization Service's Public Use Tapes. However, due to the different treatment of the Eastern and Western Hemispheres until 1976, the study's historical background consists of data beginning with 1977.

Simple linear extrapolation is the methodology used in this study to predict what immigration of various types under the old immigration law would have been had it continued through 1995 and 1996. The form of forecasting equation is

$$IMM_{it} = \quad _0 + \quad _1 T + e_{it,\ ,}$$

where IMM_{it} is immigration of type i in year t, T is a simple time trend (1, 2, . . .,15), and e_{it} is random errors. Each forecast refers to 1995 and 1996, which values are forecasted by carrying the time trend to 19 and 20 respectively. With the estimated constant term (or intercept) and the estimated coefficient on T, which indicates the direction and strength of the trend, each estimated relationship yields a "predicted value" that represents immigration under the old law if the 15-year trend continued for four (1995) and five (1996) more years. These values then are compared to a corresponding comparable value that occurred under the Immigration Act of 1990 (for 1995 and 1996). Comparable classes of immigrants, or the mapping from the old law to the new law, are

reported in Appendix A. The ratio of "actual" to "predicted" yields an estimate of the percentage difference that exists for the new law compared to the old law.

For those immigrant classes subject to a ceiling under the old law, various shares were forecasted (e.g., principals versus derivatives). The ceilings were assumed to have been met, so that the issue became not how many but rather who was admitted under the ceiling. Even when predictions are developed for aggregate numbers, the ceilings are recognized in the components that make up the aggregate prediction.

All forecasting regressions and all corresponding forecasts distinguish "principals" and "derivatives." Principals enter the United States by dint of their relationship with a U.S. citizen or resident alien, or by dint of their skills, whereas derivatives enter as the spouses and/or minor children of the principals.

Estimating linear trends is not without shortcomings. First, in certain instances nonlinear relationships may provide better fits than linear relationships. Second, in other cases step functions may fit the historical data better, and by imposing a linear trend on the data such a pattern could impose a strong trend to a relationship that would better be carried forward at a constant level. Third, certain categories of immigration occurred under a ceiling. Nevertheless, trends may be apparent under the ceiling as levels approached the maximum. In such cases ceiling levels are preferable to extrapolating the trend. Finally, some behavioral model may underlie the historical data. The problem with using more complex forecasting models is that forecast values of the independent variables of the model must be used to generate out-of-sample forecasts and these may be unavailable.

The advantage of using a similar linear trend is its simplicity. The trend line is easily extrapolated out of sample and the technique can be applied to numerous 15-year series required for this report. However, the assumptions that underlie the approach should be kept in mind.

Appendix A contains considerable detail on the methodology used here, as well as the mapping of immigrant classes from the old law to the new law. In what follows, we begin each section with a specific question regarding immigration under the new law relative to the old law.

What is the difference between actual and predicted total immigration for 1995 and 1996? The Immigration Act of 1990 appears to have slightly increased total immigration for 1995 (by 4.4%) and to have greatly increased that for 1996 (by 35.2%). The respective ratios of actual to predicted are 1.044 and 1.352. In Table 2 and in subsequent tables, a ratio of 1.0 indicates that actual equals predicted, whereas values less than 1.0 indicate that the new law yielded immigration of type i that was less than predicted under the old law. Values greater than 1.0 indicate that the new law increased immigration compared to the numbers expected under the old law. Table 2 also indicates that whereas the actual numbers are greater than those predicted for both principals (1.4% and 33.1% for 1995 and 1996, respectively) and derivatives (14.2% and 42.3%, respectively), the derivatives rose relatively more than the principals with the consequence that the share of total immigration accounted for by derivatives increased compared to that predicted under the old law (by 9.4% in 1995 and 5.2% in 1996). (Appendix A provides further detail on the methodology used to generate predicted values.)

In Table 3, the above question is addressed by occupation. This table shows that professional, technical, and kindred (or PTK) immigration was increased considerably by the Immigration Act of 1990. For both principals and derivatives each component of the PTK group (i.e., other professional, health professional, and technical specialty) increased relative to

predicted values. The same conclusion holds for the managerial and executive group. For principals, other occupational groups are generally down (except operators, fabricators, and labors – up 41.8% in 1996; farming, forestry, and fishing – up 5.2% in 1996; and services – up 2.9% in 1996). All occupational categories of derivatives increased relative to predicated values (except farming, forestry, and fishing, which is down each year).

Table 3 has two components. Table 3A provides shares of all immigrants who report an occupation. Thus, for each year values in the columns for predicted and actual shares sum to 100% for principals and derivatives taken as a whole. Shares in Table 3B sum to 100% for principals and to 100% for derivatives. In each table the shares refer only to those immigrants who report an occupation. For principals, each table indicates a strong increase in the shares for the PTK groups, as well as for managers and executives. Thus, the Immigration Act of 1990 not only increased the numbers of highly educated and skilled individuals relative to what they would have been under the old law, but also it tilted the overall composition of U.S. immigration toward the more highly skilled groups. Moreover, for derivatives, relatively large increases occurred in both the numbers of highly skilled immigrants and the percentages of such individuals compared to what was expected under the old immigration law.

Table 4 is similar to Table 3, except that Table 4 breaks out two age groups that correspond to working ages (20-34, 35-64). Principals among the PTK immigrants tend to be concentrated in the younger ages, whereas principals among managers and executives tend to in the older ages. Among derivatives, the most highly educated and skilled individuals tend to be concentrated in the older age categories.

The next series of questions relates to employment-based immigration. Under the old law the employment preferences (often called "occupational preferences") were the third (P3) and sixth (P6) preferences. These are the preference categories used for forecasting purposes.

To what extent have EB1 versus EB2 versus EB3 visa issuances increased the skill composition of U.S. immigration? These categories refer to aliens with extraordinary ability, outstanding professors or researchers, and multinational executives and managers (EB1 or E1); professionals holding advanced degrees (EB2 or E2); and skilled workers and professionals as well as needed unskilled workers (EB3 or E3). Table 5 reports four groupings (or mappings) of the data relating to the old and new laws: (1) E1/P3; (2) E3/P6; (3) (E1 + E2)/P3; and (4) (E1 + E2 + E3)/(P3 + P6). These groupings allow comparisons between the highest skills (E1 and P3) and skills in short supply (E3 and P6), as well as other comparisons that are more general, but remain within the employment preferences. The preference categories that require the very highest skills and/or education (E1and P3) suggest that for both 1995 and 1996 both principals and derivatives (who came with principals admitted under the employment preferences) were down considerably relative to the predictions. The shortfall of principals in 1995 was 0.546 of the predicted number and in 1996 was 0.892 in employment-based preference EB1 compared to what would have been expected under old preference category P3. (The respective shortfall in derivatives was 0.724 in 1995, but in 1996 an increase occurred of 12.7%).

For skills in short supply (E3 and P6), the numbers are up considerably. For principals EB3 admittances in 1995 were 130.5% higher than anticipated and in 1996 were 189.4% higher. When the mappings are expanded to include all employment preferences (E1 + E2 + E3 relative to P3 + P6), principals also were up sharply for both 1995 and 1996 (55.0% and 117.2%, respectively). Derivatives too were up, but by correspondingly smaller percentages (37.3% for

1995 and 90.5% for 1996). In Table 5, the figures for derivatives indicate nothing about the skills of derivatives because this group of immigrants does not need to satisfy any skill requirement (and indeed most of them report this occupation as our category 9, which is "homemakers, unknown, retired, etc.").

Table 5 also reports EB4 admissions, which under the old law were numerically exempt special immigrants. Under the new law they are also special immigrants, including ministers and others. These immigrants were forecasted by means of a simple time trend (unconstrained), which yields predicted 1995 and 1996 values for them. Under the Immigration Act of 1990 these immigrants are up in numbers for both principals (63.8% in 1995 and 90.7% in 1996) and derivatives (3.2% in 1995 and 13.5% in 1996).

Are the derivatives of the new employment-based categories more skilled than those of the old occupational preferences? This question is addressed by examining occupation-specific forecasts based on the sum of P3 and P6 with occupation-specific actuals based on the sum of E1, E2, and E3. Table 6 corresponds to Table 5, except that in Table 6 occupations are distinguished and EB1, EB2, and EB3 taken as a whole relative to the forecast for P3 and P6 is shown. For principals, as expected, the professional, technical, and kindred (PTK) as well as the managerial and executive groups show major increases. Health professionals stand out as the group with the largest increases for both 1995 and 1996. The answer to this question appears to be a clear "yes." Among derivatives, in 1996 health professionals (numbering 916) were 535.6% over the predicted number. Other professionals (1,375 in 1996) were 305.9% greater than predicted, and technical specialty workers (1,711 in 1996) were 145.1% greater than predicted. Most derivatives fall in the "homemaker, unknown, retired, etc." class, but among those who report an occupation the PTK groups, especially health professionals, are up considerably.

However, the numbers in these groups are understandably small compared to their counterparts among the principals.

Has "dual intent" on adjustments from nonimmigrant entry classes (in particular from H1, H1B, and L) increased skill composition? Table 7 addresses this questions. Table 7A reports principals and Table 7B shows derivatives of these principals. Principals are further divided into new entrants and those who adjust their status, with those who adjust distinguished as H1B, L1, and other adjuster. Among nonimmigrant entry classes, H1B refers to specialty occupations (and under the old law referred to admissions of "distinguished merit or ability"), and L1 refers to intracompany transferees. In addition to H1B, the H1 category includes registered nurses (H1A). Regarding H1B adjusters, the answer to the question is that professional groups, as well as managers and executives, definitely are up compared to what is predicted under the old law. For L1s, managers and executives are up, but PTK workers are not heavily represented in this group. Other adjusters are in the various high-skill occupations, but they are up in most other occupations as well. With the exception of the "other professional" category, new immigrants are lower than expected or are only slightly higher (in 1996 only). Although their numbers are not great, derivative adjusters increased skilled immigration, but less-skilled immigration also. Derivatives of new immigrants clearly increased skills.

How did the composition of source countries change due to the fact that the Immigration Act of 1990 did not subject three quarters of FB2As to per country limits? Under the Immigration Act of 1990, the former second preference became the second family based preference class (FB2). This preference class is for spouses and children of legal permanent residents. The Act further distinguishes between FB2A (spouses and children under 21 years of age) and FB2B (unmarried children 21 years of age and older). Table 8 reports information

relating to this questions. Mexico received the major benefit from the three-quarter exclusion from country limits. In 1995, Mexico alone had 51,502 FB2A admissions (relative to a predicted number of 3,740). In 1996, actual FB2A admissions from Mexico were 86,390 compared to a predicted number of 3,424. The Philippines also benefitted from FB2As, but benefitted more from FB2Bs. In short, source-country composition was strongly tilted toward Mexico and to a lesser extent toward the Philippines due to the exclusions from country limits.

Did the Immigration Act of 1990 increase the overall numbers of family-based immigration? Table 9 distinguishes principals and derivatives both for family-based numerically restricted immigration and for numerically exempt immediate relatives of U.S. citizens. The family-based restricted under the old law (Preference Classes P1, P2, P4, P5) entered under a numerical limitation that was in the late 1980s and early 1990s about 216,000 per year. Thus, for this group we predicted shares of principals (derivatives) under an annual limit of 216,000. However, immediate relatives of U.S. citizens were (and are) exempt from quota limits. Thus, immediate relatives were predicted by means of an unconstrained linear regression.

Family-based restricted principals increased considerably relative to predicted numbers (29.1% in 1995 and 68.6% in 1996). Immediate relatives of U.S. citizens were below the predicted number in 1995 (0.775), but slightly above in 1996 (1.024). In terms of shares, during 1995 and 1996 numerically restricted principals increased by 40.2% and 44.0%, respectively, relative to predicted shares. Family-based restricted derivatives fell relative to predicted numbers (0.875 in 1995 and 0.965 in 1996). **Do the above numbers differ by restricted/exempt?** From the above discussion, we can see that the answer is “yes” for numerically restricted immigrants (and strongly so), but is “no” for numerically exempt immigrants. Overall, the Immigration Act of 1990 increased immigrant numbers.

The final block of questions relates to diversity issues.

Did the Immigration Act of 1990 result in more diversity by country of birth? Tables 10, 11 and 12 relate to this question. Table 10 shows principals (9A) and derivatives (9B) by class of immigrant and country or region of birth. Country/region predictions are based on forecasts of shares (constrained to sum to 1.0) for those groups that enter under a restriction. The number of restricted employment-based principals in 1995 and 1996 exceeds predictions for most countries/regions, but especially for China, which for each year had over 10 times the predicted number. The Philippines, Canada, India, Africa, and Europe all had 1995 and 1996 numbers well in excess of their predicted numbers.

Family-based restricted principals exceeds predictions especially for Mexico, but for the Philippines as well, which were due primarily to the FB2A visas discussed above. For principals, exempt immediate relatives in 1995 were below the predicted numbers, but in 1996 were above for many countries/regions.

The most notable increase in employment-based derivatives was for China, but Canada and India also had relatively large increases. The largest relative increase (compared to predicted numbers) in restricted family-based numbers was for Africa , but the total numbers for Africa are small in comparison to other regions/countries.

The answer to the question immediately above depends upon perspective. The major source of U.S. immigrants is Mexico, and Mexico had by far the largest increases in 1995 and 1996 relative to predicted numbers. These increases were due in part to FB2A category of admissions discussed above. For example, restricted family-based principals from Mexico accounted in 1995 for 10.0% of admissions listed in Table 10 and in 1996 for 11.9%. However,

more immigrants are originating in most other parts of the world and in this sense immigration is becoming more diverse.

What is the skill composition of the new permanent diversity program? Table 11 sheds more light on the diversity questions by breaking out countries that were not qualified for "diversity visas" from those that were. (The set of diversity-qualified countries may change over time, but we took Mexico, Philippines, and India as not diversity qualified.) Table 11 reports simple cross tabs for diversity immigrants versus non-diversity immigrants from diversity-qualified countries and for immigrants from non-diversity qualified countries. In each case principals are distinguished from derivatives and occupational detail is provided. For diversity-qualified countries, diversity immigrants accounted for higher shares of the PTK groups and for smaller shares of the less skilled occupational groups. This statement holds for principals and derivatives. Thus, the qualifications for the diversity program appear to have increased skills. The non-diversity qualified countries tend to have greater shares of immigrants in less-skilled occupations than diversity-qualified countries, but health professionals is an exception.

Table 12 provides overall predictions for the various occupational groups for diversity-qualified and non diversity-qualified countries and for principals versus derivatives. For principals from diversity-qualified countries, the diversity programs appear to have increased skills. The high-skilled occupational groups all tend to have actual values in excess of predicted values for diversity-qualified countries. So do the derivatives from these countries, but for them all occupational groups tend to have risen relative to predicted numbers (although the increases are relatively largest for those with the highest skills). The permanent diversity programs thus appear to have increased skilled immigration compared to what it would have been under the old immigration law.
